CSA CONSULTATION PAPER 81-408 – *CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS*

January 10, 2017

Administering the Canadian Securities Regulatory System

Les autorités qui réglementent le marché des valeurs mobilières au Canada

TABLE OF CONTENTS

PART 1 – INTRODUCTION

Background

On December 13, 2012, the Canadian Securities Administrators (the **CSA** or **we**) published CSA Discussion Paper and Request for Comment 81-407 – *Mutual Fund Fees* (the **Original Consultation Paper**).[1] In that paper, we identified potential investor protection and market efficiency issues arising from the prevailing practice of remunerating dealers and their representatives for mutual fund sales through commissions, including sales and trailing commissions, paid by investment fund managers (**embedded commissions**). In particular, we identified how embedded commissions give rise to conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of the investors they serve.

Since the publication of the Original Consultation Paper, the CSA completed roundtable consultations and discussion forums[2], and commissioned independent research to further examine the identified investor protection and market efficiency issues.[3] After an extensive review of these inputs, in addition to our review of many other independent studies, we find that embedded commissions raise the following three key investor protection and market efficiency issues in Canada:

1. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors;

2. Embedded commissions limit investor awareness, understanding and control of dealer compensation costs; and

3. Embedded commissions paid generally do not align with the services provided to investors.

[1] The Original Consultation Paper is available on the websites of the members of the CSA.
[2] See transcript of Ontario Securities Commission roundtable held June 7, 2013, https://www.osc.gov.on.ca/documents/en/Securities-Category8/rpt_20130607_81-407_mutual-fund-fees-roundtable.pdf. The British Columbia Securities Commission and Autorité des marchés financiers held discussion forums in the summer and fall of 2013, respectively.
[3] Brondesbury Group, "Mutual Fund Fees Research", Spring 2015, https://www.securities-administrators.ca/uploadedFiles/General/pdfs/Brondesbury%20Mutual%20Fund%20Fee%20Research%20Report_engwr.pdf; Douglas Cumming, Sofia Johan and Yelin Zhang, "A Dissection of Mutual Fund Fees and Performance" (Feb. 8, 2016), https://www.osc.gov.on.ca/documents/en/Securities-Category8/rp_20160209_81-407_dissection-mutual-fund-fees.pdf

The evidence we have gathered to date shows that embedded commissions encourage the sub-optimal behavior of fund market participants, including that of investment fund managers, dealers, representatives and fund investors, which reduces market efficiency and impairs investor outcomes. In particular, the data and research we reviewed suggests that embedded commissions can:

- incent investment fund managers to rely more on payments to dealers than on the generation of performance to gather and preserve assets under management; this incentive can in turn lead to underperformance and drive up retail prices for investment products due to a competition between investment fund managers to offer attractive commissions to secure distribution;

- incent dealers and their representatives to sell funds that compensate them the best or focus on only those funds that include an embedded commission rather than recommend a more suitable investment product; specifically, they can encourage a push for higher commission generating funds, such as higher-risk actively managed funds, which can impair investor outcomes;

- due to their embedded nature and complexity, inhibit the ability of investors to assess and manage the impact of dealer compensation costs on their investment returns; and

- cause investors to pay (indirectly through fund management fees) dealer compensation that may not reflect the level of advice and service they may actually receive; the cost of the advice and service provided may exceed its benefit to investors.

These issues and their causes appear to be driven by a compensation model with inherent conflicts of interest that research suggests are pervasive and are difficult to manage effectively. Based on the evidence we have gathered, we believe that a change to a different compensation model must be considered. Investors should be provided with a compensation model that empowers them and that better aligns the interests of investment fund managers, dealers and representatives with those of investors.

Consultation on direct pay arrangements

Before taking any regulatory action, and while we consider related regulatory initiatives underway, we want to consult with stakeholders on the potential option of discontinuing embedded commissions and transitioning to direct pay arrangements that:

- better align the interests of investment fund managers, dealers and representatives with those of investors;
- deliver greater clarity on the services provided and their costs; and
- empower investors by directly engaging them in the dealer and representative compensation process.

Direct pay arrangements could consist of various types of compensation arrangements including upfront commissions, flat fees, hourly fees, fees based on a percentage of assets under administration or other arrangements, provided in all cases:

i. the arrangement is negotiated and agreed to exclusively by the investor and the dealer, through the representative, pursuant to an explicit agreement; and

ii. the investor exclusively pays the dealer for the services provided under the agreement.

Under a direct pay model, we would expect dealers to offer their clients a compensation arrangement that suits their particular investment needs and objectives and the level of service desired. Investment fund managers could facilitate investors' direct payment of dealer compensation through payments taken from the investor's investment (for e.g. deductions from purchase amounts or periodic redemptions from the investor's account).

We recognize that such a change could have a profound effect on the fund industry and on investors in Canada, including potential unintended consequences. Therefore, a decision on whether to discontinue embedded commissions will only be reached after careful consideration and assessment of the possible impacts on investors and market participants and consultation with stakeholders. Accordingly, the aims of this consultation paper (**Consultation Paper**) are to obtain the requisite information the CSA needs to make an informed decision about discontinuing embedded commissions. Specifically, our objectives are to:

- assess the potential effects on investors and market participants of discontinuing embedded commissions, including on:
    - the provision and accessibility of advice for Canadian investors, and
    - business models and market structure, including the competitive landscape of the Canadian fund industry;
- if we decide to move forward, identify potential measures that could assist in mitigating any negative impacts of such a change; and
- obtain feedback on alternative options that could sufficiently manage or mitigate the identified investor protection and market efficiency issues.

We emphasize that we have not made a decision to discontinue embedded commissions. While we continue to consult and contemplate whether regulatory action should be taken to address the issues we have identified with the current commission-based compensation model, we encourage industry to create market-driven solutions and innovations that address the concerns we raise in this Consultation Paper, including adopting business models that:

- have at their core the interests of investors;
- align the benefits to the investment fund managers, dealers and representatives with the benefits to investors;
- make for more informed, engaged and empowered investors that expect and demand services that align with the fees they pay; and

- promote fair, competitive and efficient capital markets, and foster confidence in our market.

Impact analysis

This consultation will build on our previous consultations and the important body of research we have considered to date. We particularly seek from stakeholders analysis and perspectives that:

- were not raised in the prior consultations; and

- wherever possible, are evidence-based, data-centric and Canadian-focused.

The fund industry has to date provided research that finds that higher levels of wealth are achieved by advised investors over time, and maintains that embedded commissions are essential to delivering this benefit, particularly to investors with lower levels of wealth who may not otherwise be able to afford, or may not want to pay directly for, advice.

The fund industry has also pointed to the consequences of relevant regulatory reforms in other jurisdictions (such as the U.K. and Australia) as potential evidence of the likely impact of the discontinuation of embedded commissions in Canada. While observations about the impacts of relevant reforms in other jurisdictions are informative and insightful, we consider that the potential impacts from similar reforms in Canada might not be the same. The unique features of those foreign markets, including the characteristics of their respective market participants and the specific competitive dynamics within which they operate, their market structure, the savings habits of their local investors, as well as the scope of their respective reforms may all play a role in shaping the specific impacts.

The objective of this consultation is therefore to identify the potential effects of discontinuing embedded commissions in Canada based on what we know of our fund market and its participants, including our investment fund managers, our dealers, and the investors they currently serve. This objective includes understanding the potential impact such a change may have on the accessibility and affordability of advice for Canadian investors, including lower-wealth investors, and identifying ways to minimize this impact. Ultimately, our goal is to ensure that any regulatory action we may decide to take will provide a Canadian solution to challenges specific to the Canadian market, will result in more positive outcomes for Canadian investors and will minimize disruption for market participants. For this purpose, the contribution of the stakeholders to this consultation is very important.

Related regulatory initiatives and other alternatives

We are aware of the view of many fund industry participants that mutual fund fee reforms may be unnecessary in the wake of recent reforms aimed at improving investor awareness and understanding of fees and performance under the CSA's Point of Sale disclosure (**POS**) and Client Relationship Model Phase 2 (**CRM2**) projects, and the concept proposals to enhance the registrant-client relationship discussed in CSA Consultation Paper 33-404 *Proposals to Enhance the Obligations of Advisers, Dealers, and Representatives Toward Their Clients* (**CSA CP 33-404**). We also understand that industry participants are concerned by the number of current policy initiatives that affect their business and that require substantial changes in their operations and systems. Industry has urged us to allow full implementation of the POS and CRM2 reforms and fairly assess their results, and conclude consultations under CSA CP 33-404, before signaling that significant new reforms are needed.

We are of the view that the discontinuation of embedded commissions could be complementary to our recent reforms and proposals in that those existing and ongoing initiatives were not designed to, and may not fully address, the key investor protection and market efficiency issues we have identified in this Consultation Paper. In particular, we think that as long as dealer compensation remains embedded in the fund product, investment fund managers may continue to place greater emphasis on payments to dealers than on performance to gather and preserve assets under management. This compensation model may continue to encourage higher fund fees and impair investor outcomes and market efficiency, including effective competition in our market. We believe that discontinuing embedded commissions may address these issues by better aligning the interests of investment fund managers, dealers and representatives with those of investors. In this Consultation Paper, we seek your views on our assessment of the extent to which the discontinuation of embedded commissions may be required to address our key issues, including your views on whether recent disclosure reforms and proposals to enhance the registrant-client relationship may on their own sufficiently address our concerns.

We have also canvassed and thoughtfully considered a number of alternative options to address the investor protection and market efficiency issues we have identified. As more fully discussed in Appendix B of this Consultation Paper, we did not retain those other options as we found that they did not directly or fundamentally address the identified issues to the extent that discontinuing embedded commissions may.

Comment process

We welcome comments from investors, participants in the investment fund and financial services industries, and all other interested parties to the matters discussed in this Consultation Paper. Some CSA jurisdictions will hold in-person consultations in 2017 to facilitate additional feedback and further our consideration of the issues. Please see Part 7 of this Consultation Paper for information on how to submit comments. The comment period closes on **June 9, 2017**.

Structure of Consultation Paper

The remainder of this Consultation Paper is structured as follows:

- Part 2 discusses the key investor protection and market efficiency issues we have identified in connection with embedded commissions and highlights the evidence of these issues;

- Part 3 describes the potential scope of the discontinuation of embedded commissions if we were to proceed with rule-making;

- Part 4 sets out our assessment of the potential impacts of discontinuing embedded commissions on the Canadian fund market and specific stakeholders, including the potential impacts on market structure, business models and access to advice for Canadian investors, based on an analysis of data about Canadian fund investors and market participants;

- Part 5 explores measures that could mitigate the potential impacts and unintended consequences to investors and the Canadian fund market of discontinuing embedded commissions;

- Part 6 provides an overview of existing regulatory tools and related regulatory initiatives and our assessment of the extent to which these tools and initiatives may help address the key investor protection and market efficiency issues we have identified in connection with embedded commissions;

- Part 7 explains how stakeholders may provide comments and discusses next steps;

- Appendix A provides a detailed overview of the research that provides evidence of the key investor protection and market efficiency issues discussed in Part 2;

- Appendix B discusses other options we previously considered and the reasons why we did not retain them;

- Appendix C provides an overview of relevant reforms pertaining to dealer compensation in other jurisdictions; and

- Appendix D provides a list of the consultation questions.

PART 2 – KEY INVESTOR PROTECTION AND MARKET EFFICIENCY ISSUES RAISED BY MUTUAL FUND FEES AND RELATED EVIDENCE

Further to the CSA’s consultations on the Original Consultation Paper and our review of recent Canadian and other independent research on mutual fund fees as well as various other pieces of evidence, we have identified the following three main investor protection and market efficiency issues in connection with the mutual fund fee structure in Canada:

1. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors;

2. Embedded commissions reduce investor awareness, understanding and control of dealer compensation costs; and

3. Embedded commissions paid generally do not align with the services provided to investors.

Below, we discuss each of the three issues in greater detail and reference various pieces of research and other data set out in Appendix A that evidence the issues.

We then consider the policy implications of the available evidence and the extent to which they suggest a need for change.

A. <u>The issues and related evidence:</u>

<u>Issue 1:</u> **<u>Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors</u>**

Based on the available evidence, the current embedded commission dealer compensation model appears to facilitate a mutually beneficial relationship between the investment fund managers who manufacture fund products and the dealers and representatives that distribute them. It aligns the investment fund manager's asset gathering and preservation objectives with the dealer's revenue maximization objectives. The evidence suggests that this alignment of commercial goals can alter the behavior of investment fund managers, and of the dealers and representatives who distribute the investment fund manager's products, in a way that is detrimental to market efficiency and investor outcomes. Specifically:

i. embedded commissions can reduce the investment fund manager's focus on fund performance, which can lead to underperformance;

ii. embedded commissions can encourage dealers and representatives to make biased investment recommendations which may negatively affect investor outcomes; and

iii. embedded commissions encourage high fund costs and inhibit competition by creating a barrier to entry.

i. Embedded commissions can reduce the investment fund manager's focus on fund performance, which can lead to underperformance

Investment fund managers who pay embedded commissions to dealers may be incented to rely more on those payments than on generating performance to attract and preserve assets under management. Consequently, the embedded commission structure may encourage investment fund managers to regard dealers and representatives, rather than their fund investors, as their "customers".[4]

---

[4] This observation was similarly made by Gloria Stromberg in *Regulatory Strategies for the Mid-'90s, Recommendations for Regulating Investment Funds in Canada,* January 1995, at pages 17-18 where she discusses this concern as follows:

> "Another result that has flowed from the need to secure distribution channels is that independent investment fund organizations no longer appear to regard the investors in their sponsored investment funds as being their "customers" in terms of such investors being the persons whose needs, expectations and interests that their operations are intended to serve. Instead, their organizations regard the distributors – i.e. mutual fund dealers, mutual fund specialists, financial planners, investment dealers and, in some cases, the individual sales representatives that are employed by these firms – as being their "customers" and their

The research that we have gathered and reviewed suggests that this inherent conflict of interest diminishes the investment fund manager's focus on risk-adjusted outperformance, thus impairing investor returns.

ii. Embedded commissions can encourage dealers and representatives to make biased investment recommendations which may negatively affect investor outcomes:

Dealers and representatives who are compensated through embedded commissions may be incented to make biased investment recommendations that give priority to maximizing compensation over the interests of the client. The research we have gathered and reviewed suggests that:

- compensation bias arising from embedded commissions can incent dealers and representatives to:
  - recommend higher cost fund products that pay them higher embedded commissions than other suitable lower-cost and, possibly, better performing products, and
  - promote the use of a particular purchase option[5], such as the deferred sales charge (**DSC**) option[6], that pays higher upfront embedded commissions, regardless of the

---

immediate focus is on satisfying the needs of these people instead of the needs of the investors in their sponsored investment funds."

We note the U.K.'s Financial Services Authority (**FSA**) (now known as the Financial Conduct Authority) also made similar observations in the work leading up to its Retail Distribution Review reforms discussed in Appendix C of this Consultation Paper. In a speech entitled "Is the present business model bust?" given on September 16, 2006, the Chairman of the FSA stated the following:

> "And one of the key questions that must be addressed is this: who is the real customer of the provider – is it the policyholder who invests their money in the hope of seeing a decent return? Or is it the distributor, who in the main, secures access to the end-consumer for the provider? If, as many commentators would have it, it is indeed the distributor who is the actual customer of the provider, this raises all manner of difficulties which further perpetuate the shortcomings of the current model – particularly with regard to treating the real customer fairly. I understand well that many are frustrated by what they describe as the "commission stranglehold" that the advisory community enjoys, but so long as providers continue to compete over the attractiveness of their commission proposition, the fundamental flaws in the present business model will remain."

[5] Mutual funds in Canada can be purchased under one of four primary options:

1. **No load:** The investor does not pay any direct charges for fund securities purchased or redeemed; the dealer is paid a trailing commission by the investment fund manager.
2. **DSC:** The investor does not pay a sales charge for fund securities purchased, but may have to pay a redemption fee if the securities are sold before a predetermined period has elapsed; the dealer is paid both an upfront commission and a trailing commission by the investment fund manager. For more details on this option, see note 6.

availability of other purchase options that may better suit the investor's needs and objectives; and

- biased advice has an economically significant cost on investor outcomes.

iii. Embedded commissions encourage high fund costs and inhibit competition by creating a barrier to entry:

The research we have gathered and reviewed suggests that competition between investment fund managers to offer high embedded commissions to attract and secure distribution encourages and preserves high overall fund fees and discourages the manufacturing and sale of lower-cost

---

3. **Front end:** The investor pays a negotiable sales charge to the dealer at the time of purchase that is deducted from the amount invested, but does not pay a redemption fee to redeem; the dealer is paid a trailing commission by the investment fund manager.
4. **Fee based:** The investor does not pay a sales charge to purchase, or a redemption fee to redeem, fund securities, but instead pays an ongoing fee directly to the dealer pursuant to an agreement with the dealer; the dealer generally does not receive any compensation from the investment fund manager.

[6] When purchasing fund investments under the DSC option (also known as the "back end load" option), the investor does not directly pay a sales commission to their dealer or representative at the time of purchase. The entire amount paid by the investor is accordingly invested in the fund at the time of purchase. While the investor does not directly pay a sales commission to the dealer or representative at the time of purchase, the dealer and the representative, through the dealer, typically receive a commission from the investment fund manager equivalent to 5% of the amount purchased. The investment fund manager may borrow the money necessary to pay these upfront commissions and therefore will incur financing costs. These costs are recouped by the investment fund manager through the ongoing management fees charged to the fund. Accordingly, the cost of the upfront commissions is embedded in the ongoing costs of the fund.

While investors do not pay a sales charge to their dealer at the time they make their purchase under the DSC option, they may pay a redemption fee to the investment fund manager if they redeem their investment within a predetermined number of years from purchase, typically 5 to 7 years. The redemption fee is designed to deter an investor from redeeming the investment and accordingly preserve assets under management. The redemption fee works on a declining scale, typically starting around 6% in the first year and declines by about 1% each year down to 0% at the end of the specified holding period. The investor may switch his investment to other funds within the investment fund manager's fund lineup without triggering redemption fees. However, a switch fee of typically up to 2% may apply.

Many investment fund managers offer a low-load sales charge option, which works like the DSC option, but on a shorter schedule – typically 3 years or less. The upfront commission paid by the investment fund manager to the dealer and the redemption fee payable by the investor on a redemption made within the specified holding period are also correspondingly reduced (down to approximately 2 to 3%).

In this Consultation Paper, unless otherwise indicated, references to the "DSC option" include the "low-load sales charge option".

According to data from Investor Economics, as at December 2015, 20% of Canadian fund assets totalling $234 billion were held in the DSC option.

alternatives, thus limiting price competition in Canada. This competition on the basis of commissions has a distorting effect on the allocation of capital by rewarding some investment fund managers more than is warranted, and others less than is warranted, while discouraging some from entering the market entirely.

Evidence:

In Appendix A, we provide evidence substantiating how the conflicts of interest inherent in embedded commissions alter the behavior of investment fund managers, dealers and representatives at the expense of market efficiency and investor interests.

<u>Issue 2:</u> **<u>Embedded commissions limit investor awareness, understanding and control of dealer compensation costs</u>**

Based on the available evidence, embedded commissions appear to limit investor awareness, understanding and control of dealer compensation costs. Specifically:

i. the lack of saliency of embedded commissions reduces investors' awareness of dealer compensation costs;

ii. embedded commissions add complexity to fund fees which inhibit investor understanding of such costs;

iii. the product embedded nature of dealer compensation restricts investors' ability to directly control that cost and its impact on investment outcomes.

i. The lack of saliency of embedded commissions reduces investors' awareness of dealer compensation costs:

To facilitate the sale of funds, the Canadian fund industry has over the last several years gradually shifted away from transaction-based sales commissions paid directly by investors toward a greater reliance by both investment fund managers and dealers on product embedded commissions. For example, in 1996, trailing commissions accounted for slightly more than one quarter of a typical representative's book of business; by 2011, that share had grown to an estimated 64%.[7]

This move away from transaction-based sales commissions has reduced the saliency of dealer compensation costs for investors and, accordingly, reduced their sensitivity to such costs. The research we have gathered and reviewed is clear that the majority of Canadian fund investors are not aware of what they pay for financial advice or that they pay for financial advice at all.[8] Consequently, these costs do not figure into their decision-making. The research we have

[7] Investor Economics, *Investor Economics Insight,* March 2012, at p.9.

[8] The new report on charges and other compensation implemented in the context of CRM2 was designed to increase the transparency of dealer compensation costs for investors. In Part 6 of this Consultation Paper, we provide an analysis of the extent to which CRM2 is expected to respond to Issue 2 above.

gathered and reviewed suggests that investors are more sensitive to salient upfront fees like front-end loads and are more likely to control such visible and salient fees that they must pay directly.

ii. Embedded commissions add complexity to fund fees which inhibit investor understanding of such costs:

Further contributing to investors' limited awareness and understanding of fund fees, including embedded commissions, is the complexity of fund fees in terms of structure and options on offer. Although all dealer compensation costs that fund investors pay directly (such as sales charges) and indirectly through ongoing fund fees (such as trailing commissions) are disclosed in the fund's prospectus, the fund facts document and the annual report on charges and other compensation, the variance in such fees between investment fund managers, fund types (i.e. asset classes), fund series and purchase options can overwhelm investors' capacity to understand the specific fund fees, including dealer compensation costs, that apply to their investment.

The complexity of the mutual fund fee structure can make it challenging for all but sophisticated investors to measure the value of the services they receive against the costs they pay and assess the impact of fees on their investment returns.

The research we have gathered and reviewed suggests that price complexity in retail financial products increases the information asymmetry between investors and product manufacturers and distributors, which increases investors' reliance on more informed intermediaries for their investment choices and decisions.

iii. The product embedded nature of dealer compensation restricts investors' ability to directly control that cost and its effect on investment outcomes:

Since the cost of dealer compensation is embedded in the fund's ongoing management fees, investors have no ability to directly negotiate this cost and consequently have no control over the amount they ultimately pay their dealer and their representative. The only control investors have on dealer compensation costs under the embedded commission model is to vote on a proposed increase to fund management fees (from which dealer compensation is paid).[9]

Opportunities for retail investors in Canada to reduce the trailing commissions they indirectly pay or avoid them altogether are very limited. As a result, investors who may desire little or no advice (e.g. do-it-yourself investors) may often bear the cost of full unreduced trailing commissions. And investors who do desire advisory services but who wish to pay for them directly rather than through embedded commissions similarly have limited options because direct pay arrangements are typically available only through dealers servicing higher net worth investors. We note that even though the vast majority of investment fund managers now offer fee-for-service series (e.g. Series F) for minimal investments, the distribution of such series is

[9] Under section 5.1 of National Instrument 81-102 *Investment Funds*, the prior approval of securityholders of an investment fund is required for an increase in a fee or expense that is charged to an investment fund or directly to its securityholders.

still limited in comparison to the distribution of series with embedded commissions due to the fee-based account minimums imposed by the dealer.[10]

Furthermore, because trailing commissions are deducted at the fund level rather than the account level, some investors indirectly subsidize certain dealer compensation costs that are not attributable to their investment in the fund, which means they indirectly pay excess fees. This situation is called “cross-subsidization”. For example, front-end load investors in a fund may cross-subsidize the costs attributable to DSC investors.[11] Opportunities for cross-subsidization would be reduced if each investor were charged a fee covering his/her own distribution costs at the account level, which would enable each investor to pay only for his/her costs and thus have greater control over such costs.

Investors’ inability to make an informed choice based on fund costs, including dealer compensation, and to control such costs due to their product-embedded nature can lead to sub-optimal investment choices and outcomes.

Evidence:

At Appendix A, we provide evidence that:

- the lack of saliency and the complexity of fund fees, including embedded commissions, impacts investors’ awareness and understanding of such fees and accordingly reduces the significance of fund fees as a factor in investor decision-making; and

- the product embedded nature of dealer compensation restricts investors’ ability to directly control that cost and its impact on investment outcomes; this evidence includes an overview of:
  - the cross-subsidization that results from dealer compensation charged at the fund level, and
  - the limited options investors currently have in Canada to limit or avoid the payment of embedded commissions.

Issue 3: Embedded commissions paid generally do not align with the services provided to investors

There is generally no clear relationship between the level of embedded commissions set and paid by the investment fund manager to the dealer and the level of services and advice the dealer and the representative provide to investors in exchange for such compensation. Specifically:

i. investors do not receive ongoing advice commensurate with the ongoing trailing commissions paid; and

[10] Investor Economics, *Investor Economics Insight*, July 2016.

[11] We refer you to note 6 where we explain the DSC option and the associated cost to the investment fund manager of funding the payment of an upfront commission to dealers for sales made under that option.

ii. the cost of advice provided through commissions may exceed its benefit to investors.

i. Investors do not receive ongoing advice commensurate with the ongoing trailing commissions paid:

As mentioned above, trailing commission rates may vary between investment fund managers, fund types, fund series and purchase options. They may also in some cases vary over the course of the investment.[12] While a reasonable assumption might be that the rate of the trailing commission is reflective of the level of service an investor receives from a dealer and their representative (i.e. the greater the rate, the greater the service), current practice suggests that no such relationship exists between the fees paid and the services provided in exchange.

Embedded commissions are paid to dealers regardless of the extent of the services that a representative provides to the investor in connection with an investment in a fund. The same compensation is paid irrespective of whether the representative provides only transaction-oriented advice or provides a broader range of ongoing investment services and financial advice that is tailored to the investor's specific needs. For example, our review of the Canadian fund market finds that higher than average trailing commissions are sometimes paid on investment funds offering pre-packaged investment solutions (i.e. funds-of-funds) that relieve the representative from having to do much of the fund selection and asset allocation they might otherwise have to do for a client. Similarly, discount brokers who provide execution-only services often distribute fund series that pay them the same trailing commission that would be paid to a full service dealer.

The 'one-size-fits-all' nature of the trailing commission payment therefore seems misaligned with the provision of services and advice customized to the investor's specific needs, expectations and preferences. A contributing factor to this misalignment is likely investors' low awareness and understanding of fees including dealer compensation (as discussed under Issue 2 above), which causes investors to not demand a level of service and advice commensurate with the fees they have indirectly paid for.

Absent a clear relationship between the rate of the embedded compensation paid to the dealer and their representative and the level of services an investor receives in return, the payment of embedded compensation may be perceived to be tied to the simple distribution of the fund product as opposed to the provision of ongoing advice and services. Certain industry submissions received in response to our Original Consultation Paper would seem to confirm this view as several commenters indicated that trailing commission payments support dealer operations and sales activity more than the provision of ongoing advice.

[12] For example, we have seen trailing commission rates that increase in steps with each year the investor continues to hold the investment, reaching a specified maximum rate after a certain number of years. It is also typical for trailing commission rates to double at the expiration of a DSC redemption schedule (5 to 7 years). For example, a trailing commission rate of 0.50% for an investment held in an equity fund under the DSC option may increase to 1.00% at the expiration of the redemption schedule.

If investors are getting basic one-time services centered on the trade as opposed to ongoing advice and services in exchange for the ongoing embedded commissions paid out of their funds' management fees, they may be indirectly paying too much for the services they are actually receiving. Moreover, since the aggregate amount of embedded commissions that investors pay increases as their holding period increases, those investors who remain invested longer may pay more fees than others for the same basic service.

ii. The cost of advice provided through embedded commissions may exceed its benefit to investors:

Some of the research we reviewed suggests that investors may derive no measurable net benefit from financial advice paid for through embedded commissions and may in some cases be worse off because of it. Certain research finds that the advice of representatives may be skewed not only by compensation biases, but may also be affected by representatives' varying skills and knowledge about investing which in some cases may benefit from increased proficiency requirements. Other research suggests that the benefits that investors derive from the advice of representatives may be largely behavioral and thus intangible in nature, such as the development of good savings discipline, overcoming inertia, the reduction of anxiety, and the creation of trust.

Evidence:

In Appendix A, we provide evidence that:

- investors do not receive ongoing advice commensurate with the ongoing trailing commissions paid; and

- the cost of advice provided through embedded commissions may exceed its benefit to investors.

Questions

1. Do you agree with the issues described in this Part? Why or why not?

2. Are there other significant issues or harms related to embedded commissions? Please provide data to support your argument where possible.

3. Are there significant benefits to embedded commissions such as access to advice, efficiency and cost effectiveness of business models, and heightened competition that may outweigh the issues or harms of embedded commissions in some or all circumstances? Please provide data to support your argument where possible.

B. Policy implications:

The foregoing shows that product embedded commissions affect the behavior of fund market participants in a way that undermines investor protection and the fairness and efficiency of our capital markets as well as confidence in our market. This situation suggests a need to consider regulatory action.

To address the investor protection and market efficiency issues outlined in this Consultation Paper, the CSA considered and discussed the range of policy options set out in the chart below:

Potential regulatory options									
1. Use existing tools		**2. Enhancements to disclosure**		**3. Investment fund manager focused initiatives**			**4. Enhancements to registrant-client relationship**	**5. Mutual fund fee reforms**	
Roll out POS and CRM2 and monitor impact	Conduct NI 81-105 mutual fund sales practices reviews	CRM2 cost reporting / performance reporting benchmarking	Better fee disclosure in fund facts (giving more context for fund costs)	Require separate series for each purchase option	Make distribution costs an expense of the fund	Require DIY discount series	Consider extent to which concept proposals under CSA CP 33-404, if implemented, may respond to fund fee issues	Cap all forms of embedded compensation to a maximum limit	Discontinue all forms of embedded compensation

CSA regulatory project focus	Regulatory options not retained

<u>Guiding considerations for evaluation of options:</u>

Our evaluation of the range of options and determination of which options should be retained and which ones should not were guided by the extent to which an option directly addresses the three investor protection and market efficiency issues we identified. We specifically considered the questions below:

a. How many problems does the option address and to what degree?

b. Would the impact be direct/immediate rather than indirect/over time?

c. What is our level of uncertainty regarding the impacts/what is our expectation regarding unintended consequences?

d. Does it simplify or add to the complexity of the fund fee structure?

e. Does it enhance competition in our market and market efficiency generally?

Where we determined that an option would potentially address one issue to some degree, but at the same time would fail to address or would likely exacerbate another issue, or would potentially increase the complexity of fund fees or fail to enhance competition in the market, we opted to not retain the option.

When we evaluated the options through this lens, our analysis drew us to not retain the options highlighted in red and retain the options highlighted in green in the table above.

The options we opted to not retain and the reasons why are described in Appendix B of this Consultation Paper.

The options we retained include:

i. maintain and use our existing tools, namely enhanced transparency of fund fees under POS and CRM2, and review of sales incentives under NI 81-105 *Mutual Fund Sales Practices* (**NI 81-105**);

ii. continue to explore concept proposals under CSA CP 33-404 to strengthen the obligations of dealers and their representative towards their clients; and

iii. discontinue embedded commissions and transition to direct pay arrangements.

Following a thorough evaluation, we believe that options "i" and "ii" may provide only a partial resolution to the issues identified in this Consultation Paper and that option "iii" may need to be considered in conjunction with options "i" and "ii" to achieve the desired outcomes. We accordingly view option "iii" as being complementary to options "i" and "ii".

In Part 6 of this Consultation Paper, we provide our detailed assessment of the extent to which the above key issues may be addressed by existing CSA regulation and ongoing proposals, and seek your views on that assessment.

PART 3 – OVERVIEW OF THE PROPOSED OPTION TO DISCONTINUE EMBEDDED COMPENSATION

In this part, we discuss the potential scope of the discontinuation of embedded commissions should the CSA decide to move forward with rule-making. In particular, we consider:

- what types of securities would be affected, and
- what types of payments would be discontinued.

1. Types of securities affected

NI 81-105, implemented in 1998, governs the payments that investment fund managers may make to dealers in connection with the distribution of securities of a mutual fund.[13] While that

---

[13] NI 81-105 came into force on May 1, 1998. Part 2 of Companion Policy 81-105CP provides background on NI 81-105 and describes its purpose. NI 81-105 was adopted by the CSA as a response to the concern of many participants in the mutual fund industry that prospectus disclosure of sales practices, coupled with the discipline imposed by competitive market forces, were not sufficient to discourage sales practices and compensation arrangements that gave rise to questions as to whether dealers and their representatives were being induced to sell mutual fund securities on the basis of the incentives they were receiving as opposed to what was suitable for and in the best interests of their clients.

The purpose of NI 81-105 is to ensure that the interests of investors remain uppermost in the actions of participants in the mutual fund industry by setting minimum standards of conduct designed to minimize the conflicts between the rule currently applies only to mutual funds that are reporting issuers, we recognize that its regulatory objectives have equal application to the distribution of other investment funds and comparable investment products that we regulate.[14]

Over the last few years, the CSA have made regulatory changes to ensure a consistent regulatory framework in key areas for all types of retail investment funds, regardless of whether structured as a mutual fund, an exchange-traded mutual fund (**ETF**) or a non-redeemable investment fund.[15] We have also recognized the growth of structured notes[16] as a retail investment product and communicated our intention to regulate them in a similar manner to investment funds, where appropriate.[17]

While investment funds and structured notes sold in the exempt market have to date generally not been subject to the same requirements as retail investment funds, we consider that the investor protection and market efficiency issues that stem from embedded commissions, as

---

legitimate commercial goals of industry participants and the fundamental obligations that are owed by industry participants toward investors.

[14] See "Request For Comments on Sales Practices Applicable To The Sale Of Mutual Fund Securities – Notice of Proposed Rule and Proposed Companion Policy Under The Securities Act", Ontario Securities Commission (**OSC**) Bulletin, (1996) 19 OSCB, page 4727, in which the OSC sought comments on a local rule proposal that would later become NI 81-105 and be adopted by all CSA jurisdictions. At page 4728, the OSC states: "Although the proposed Rule applies only to the distribution of publicly offered mutual funds, the Commission is of the view that the regulatory objectives of the proposed Rule have equal application to the distribution of all collective money management schemes. Ultimately, the distribution of all schemes should be subject to the same or equivalent rules and standards."

[15] See "Modernization of Investment Fund Product Regulation (Phase 2) – Final Amendments", in force as of September 22, 2014, https://www.osc.gov.on.ca/en/SecuritiesLaw_ni_20140619_81-102_final-amendments-phase2.htm. The objective of Phase 2 of this project was to identify and address any market efficiency, investor protection and fairness issues that arose out of the differing regulatory regimes that applied to publicly offered mutual funds and non-redeemable investment funds and make the necessary amendments to achieve consistent product regulation across the spectrum of retail investment funds. Under these amendments, certain investment restrictions and operational requirements applicable to mutual funds and ETFs were extended to non-redeemable investment funds.

[16] A structured note, or linked note, is a specified derivative, as defined in National Instrument 44-102 – *Shelf Distributions*, for which the amount payable is determined by reference to the price, value or level of an underlying interest that is unrelated to the operations or securities of the structured note issuer. Structured notes issued under the shelf prospectus are generally non-principal protected securities issued by a deposit taker.

[17] In CSA Staff Notice 44-305 – *2015 Update – Structured Notes Distributed under the Shelf Prospectus System* (**CSA Staff Notice 44-305**), the CSA recognized the growth of structured products as a retail investment product and our intention to adapt our regulatory approach to ensure consistency, where appropriate, in how we regulate structured notes and similar retail products such as investment funds. CSA Staff Notice 44-305 noted that some structured note issuers charge fees on a basis similar to investment funds. These fees may include sales commissions and embedded ongoing service fees or trailing commissions paid by the structured note issuer to dealers and their representatives.

evidenced under Part 2, require consistent treatment both in the prospectus-qualified and prospectus-exempt markets. To do otherwise would create an opportunity for regulatory arbitrage.[18]

Recognizing that the fee structure of various types of investment funds and structured notes commonly includes embedded commissions, and with the aim of promoting a level playing field amongst comparable investment products and limiting opportunities for regulatory arbitrage, we currently anticipate that any regulatory proposal to discontinue embedded commissions would affect:

- an "investment fund"[19], as defined under securities legislation and
- structured notes,

whether sold under a prospectus or in the exempt market under a prospectus exemption.

Although investment fund-like products, such as segregated funds, are not within the purview of securities legislation and therefore would not be captured in any CSA rule proposal to discontinue embedded commissions, we recognize the importance of a harmonized approach to regulating such products given their similarity to investment fund products, including their payment of product embedded commissions to intermediaries. The CSA will accordingly continue to liaise with insurance regulators to address the potential risk of regulatory arbitrage between investment funds and individual segregated funds.

In the interest of achieving a harmonized approach, the Canadian Council of Insurance Regulators (**CCIR**) established a Segregated Funds Working Group in 2015, with a mandate to, among other things, identify potential gaps in the comparative regulatory frameworks for segregated funds and mutual funds and assess the potential risk of regulatory arbitrage by dually-licensed (insurance and mutual funds) insurance agents. In their May 2016 issue paper calling for input on how to address key gaps between the regulations pertaining to mutual funds and segregated funds[20], the CCIR indicates that although it is currently not aware of any statistical evidence to demonstrate that regulatory arbitrage is occurring between mutual funds and segregated funds, it will act proactively to amend regulation where appropriate to ensure that intermediaries have little incentive to prioritize their own interests over those of clients. The issue paper identifies the CSA's consultation on how to address the potential investor protection and market efficiency issues arising from embedded commissions as an issue of particular

[18] In the Original Consultation Paper, we recognized that there may be other investment fund products whose fee structure may raise similar investor protection and fairness issues for investors, and that accordingly, any regulatory initiative that we would ultimately undertake would assess whether the same initiative should also apply to other investment funds and comparable securities products.

[19] The definition of "investment fund" captures conventional mutual funds, ETFs and non-redeemable investment funds.

[20] Canadian Council of Insurance Regulators, *Segregated Funds Working Group Issues Paper*, May 2016, http://www.ccir-ccrra.org/en/init/IVIC_POS/IVICs%20Issues%20Paper%20(ENG).pdf.

relevance, and the CCIR will review the CSA policy direction on this matter and assess its appropriateness for segregated funds.[21]

Questions

4. For each of the following investment products, whether sold under a prospectus or in the exempt market under a prospectus exemption:

   - mutual fund
   - non-redeemable investment fund
   - structured note

   should the product be subject to the discontinuation of embedded commissions? If not:

   a. What would be the policy rationale for excluding it?

   b. What would be the risk of regulatory arbitrage occurring in the exempt market if embedded commissions were discontinued for the product only when sold under prospectus?

5. Are there specific types of mutual funds, non-redeemable investment funds or structured notes that should not be subject to the discontinuation of embedded commissions? Why?

6. Are there other types of investment products that should be subject to the discontinuation of embedded commissions? Why?

2. Types of payments discontinued

NI 81-105 currently prohibits mutual funds that are reporting issuers and members of the organization of such mutual funds from making payments to dealers or their representatives in connection with the distribution of securities of a mutual fund. The rule however excepts from this prohibition the payment of commissions (including trailing commissions) and the provision of support to dealers for marketing and educational practices by members of the organization of mutual funds.

If the CSA were to move forward with a rule proposal, we currently anticipate that we would seek to discontinue any payment of money to dealers in connection with an investor's purchase or continued ownership of a security described above that is made directly or indirectly by any person or company other than the investor. The rule would preclude compensation to dealers that is paid or funded by the investment fund or the investment fund manager or structured note issuer out of fund assets or revenue.

[21] Ibid. p. 15

We anticipate this change would at a minimum prohibit the payment by investment funds, investment fund managers or structured note issuers to dealers of the following embedded commissions:

- ongoing trailing commissions or service fees; and
- upfront sales commissions for purchases made under the DSC option.

To be clear, the discontinuation of embedded commissions would enable dealers and their representatives to adopt various types of compensation arrangements. Under direct pay arrangements, dealers and their representatives could opt to be compensated through upfront commissions (such as front-end sales loads), hourly fees, a flat fee, a fee based on a percentage of the client's assets under administration (**fee-based arrangement**), or other suitable compensation arrangement, provided in all cases:

a. the method and the rate of the representative's compensation in connection with the purchase of a security and other services provided to the investor are negotiated and agreed to exclusively by the investor and the dealer, through the representative, pursuant to an explicit agreement; and

b. the investor exclusively pays the dealer for the services provided under the agreement.

Under direct pay arrangements, we would expect dealers and representatives to offer their clients a compensation arrangement that suits their particular investment needs and objectives and reflects the level of service desired. For example, ongoing fees should be charged for ongoing services.

We believe that the above terms mitigate the close alignment of interests between investment fund managers, dealers and representatives.

While investment funds, investment fund managers and structured note issuers would no longer be allowed to pay or fund compensation to dealers from their own assets or revenue in connection with an investor's purchase or continued ownership of a security, we anticipate allowing them to facilitate the investor's payment of dealer compensation. Specifically, the investment fund manager would be permitted to collect the dealer's compensation, either through deductions from purchase amounts or through periodic withdrawals or redemptions from the investor's account, and remit it to the dealer on the investor's behalf, provided the investor consents to this method of payment.

At this time, we anticipate that we would permit the following types of dealer compensation payments:

- referral fees paid for the referral of a client to or from a registrant;[22]

[22] Referral fees are defined in NI 31-103 – *Registration Requirements, Exemptions and Ongoing Registrant Obligations* and would continue to be permitted subject to the requirements of that rule.

- dealer commissions paid out of underwriting commissions on the distribution of securities of an investment fund or structured note that is not in continuous distribution under an initial public offering;

- payments of money or the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105; [23] and

- internal transfer payments[24] from affiliates to dealers within integrated financial service providers[25] which are not directly tied to an investor's purchase or continued ownership of an investment fund security or structured note.

We acknowledge that the above types of payments may give rise to conflicts of interest that may continue to incent registrant behavior that does not favour investor interests. We therefore seek your responses to the questions below.

Questions

7. Do you agree with the discontinuation of all payments made by persons or companies other than the investor in connection with the purchase or continued ownership of an investment fund security or structured note? Why or why not?

8. Are there other fees or payments that we should consider discontinuing in connection with the purchase or continued ownership of an investment fund security or structured note,

[23] Under Part 5 of NI 81-105, members of the organization of a mutual fund may:

- pay to a dealer direct costs incurred by the dealer relating to investor conferences or investor seminars or other conferences or seminars prepared or presented by the dealer (ss. 5.1 and 5.5),

- provide a non-monetary benefit to a representative of a dealer by allowing him or her to attend a conference or seminar organized and presented by the investment fund manager (s.5.2),

- pay the registration fees of a representative of a dealer for a conference, seminar or course that is organized and presented by a person or company other than the investment fund manager (s.5.3), and

- provide a non-monetary benefit of promotional nature and of minimal value to a representative of a dealer,

subject in each case to compliance with specified requirements.

[24] See MFDA Bulletin #0689-P, *Implementation of Requirements under CRM2 Phase 2 Amendments to NI 31-103 – Frequently Asked Questions (FAQs)*, May 13, 2016. Question #18 and the MFDA response on pages 8 and 9 discuss internal transfer payments.

[25] For the purpose of this consultation, an "integrated financial service provider" is a firm that is comprised of at least one dealer and one investment fund manager or structured note issuer that are affiliates of each other.

including:

a. the payment of money and the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105;

b. referral fees; and

c. underwriting commissions.

Why? What is the risk and magnitude of regulatory arbitrage through these types of fees and commissions?

9. If payments and non-monetary benefits to dealers and representatives for marketing and educational practices under Part 5 of NI 81-105 are maintained further to the discontinuation of embedded commissions, should we change the scope of those payments and benefits in any way? If so, why?

10. With respect to internal transfer payments:

    a. How effective is NI 81-105 in regulating payments within integrated financial service providers such that there is a level playing field for proprietary funds and third party funds?

    b. Should internal transfer payments to dealers within integrated financial service providers that are tied to an investor's purchase or continued ownership of an investment fund security or structured note be discontinued? Why or why not? To what extent do integrated financial service providers directly or indirectly provide internal transfer payments to their affiliated dealers and their representatives to incent the distribution of their products?

    c. Are there types of internal transfer payments that are not tied to an investor's purchase or continued ownership of an investment fund security or structured note that should be discontinued?

11. If we were to discontinue embedded commissions, please comment on whether we should allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf.

PART 4 – REGULATORY IMPACT

The purpose of this part is to outline our assessment of the possible market impacts of discontinuing embedded commissions. In particular, we assess the potential impacts this change could have on the Canadian investment fund sector, including on market structures, business models and on the accessibility and scope of advice provided to retail investors, based on data we have gathered and the conclusions we have drawn from this data.

The regulatory impact part is divided into four sections. In section one, we provide a number of important facts about Canadian households, the fund market and the distribution of funds and securities in general that will help us anticipate possible market impacts of discontinuing embedded commissions. In section two, we outline possible overall or high-level impacts on the market in the event of the discontinuation of embedded commissions. This section is followed, in section three, by a more narrow focus on the impacts to specific stakeholders. Finally, in section four, we conclude by outlining how the discontinuation of embedded commissions may address the key issues outlined previously in Part 2 of this Consultation Paper. We look to all stakeholders to provide feedback and data responding to the conclusions that we draw here.

1. *Important facts about the fund market and fund market participants today*

A prerequisite for the CSA's assessment of possible policy options regarding fund fees was to understand and analyze what we know about the market today and in particular, what we know about the respective market participants – advised and non-advised fund investors, consumers of financial services generally, access to advice by retail investors, investment fund distribution channels and investment fund managers.

We provide pertinent information for each of these groups below using data from Investor Economics, Investment Industry Regulatory Organization of Canada (**IIROC**), Mutual Fund Dealers Association (**MFDA**), Morningstar Direct and the Ipsos Canadian Financial Monitor survey.[26]

a. *Canadian Households*

At the end of 2015, financial wealth of Canadian households reached $3.8 trillion dollars, increasing an average 5.8% per year since 2005. In comparison, household credit (due primarily to the increase in residential mortgages) grew 7.6% over the same period reaching just under $2 trillion dollars at the end of 2015. In aggregate, and as widely reported elsewhere,[27] Canadian households have become more leveraged over the last 10 years.

Within the asset side of the balance sheet, Canadian households, in aggregate,[28] had a significant and growing share of their total financial wealth in funds and cash and cash equivalents. At the end of 2015, Canadian households held $1.5 trillion or 40% of their aggregate financial wealth in investment fund securities and $1.2 trillion or 32% of aggregate wealth in cash and cash

[26] We have tried to provide the most recent data available wherever possible.

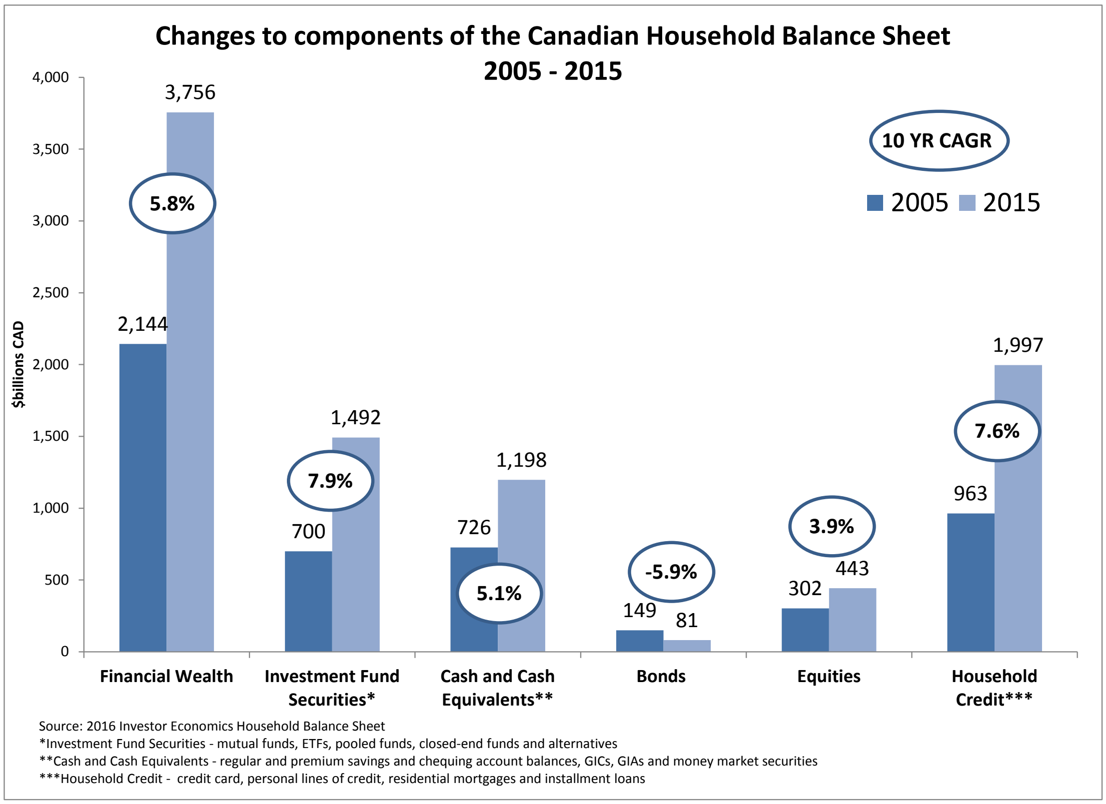
[27] See for example, Maciej Onoszko, "Canada's record household debt is threatening its financial stability, global bankers fear", *Bloomberg News,* October 24, 2016.

[28] It is important to note that aggregated household wealth figures do not provide information regarding the importance of these savings and investment products to the average household or to specific household segments (e.g. mass market, affluent, etc.). For example, investment funds may make up 40% of aggregate household financial wealth at the end of 2015 but they do not make up 40% of the average Canadian household's financial wealth.

equivalents[29]. In comparison, directly held securities (stocks and bonds) made up only $524 billion or 14% of aggregate financial wealth. Total assets held in bonds in particular declined over the last 10 years while assets held in equities saw relatively modest growth.

While both investment fund securities and cash and cash equivalents made up a significant portion of aggregate household financial wealth at the end of 2015, assets within investment funds have grown faster since 2005. On average, investment fund assets increased by 7.9% per year over the last ten years compared to 5.1% for cash and cash equivalents.

<u>Figure 1: The Canadian household balance sheet in aggregate</u>



We turn now to the distribution of assets and investment fund ownership across households by analyzing the data from the 2012 Ipsos Canadian Financial Monitor.[30]

---

[29] Investor Economics, *Household Balance Sheet Report, Update and Rebased Forecast*, July 2016. In this report, "Financial Wealth" encompasses financial products held for the purpose of accumulating and preserving wealth including short-term instruments, deposits (including GICs and market-linked securities), fixed income securities, equities, investment funds and assets held in capital accumulation plans such as defined contribution plans (but not defined benefit plans).

[30] The Ipsos Canadian Financial Monitor survey is a syndicated survey based on an annual sample of 12,000 households that are demographically and regionally representative of the Canadian population. Each household completes a detailed questionnaire providing comprehensive information on all aspects of its financial holdings and activity.

The majority of Canadian households have investable assets below $100,000

Table 1: Household distribution by investment fund ownership and investable asset band

Breakdown of households by investable assets and fund ownership (base: all households)

Household Investable Assets	Household owns investment funds	Household does not own investment funds	% of total households
Up to $100k	14.6%	52.6%	67.2%
$100 - $500k	18.0%	8.9%	27.0%
Greater than $500k	4.5%	1.4%	5.9%
% of total households	**37.1%**	**62.9%**	**100.0%**

Source: 2012 Ipsos Canadian Financial Monitor

The first important fact with respect to Canadian households is that the majority of households that save have investable assets of $100,000 or less. At the end of 2012, 67% of households had investable assets[31] of $100,000 or less (**mass-market households**), 27% had investable assets of between $100,000 and $500,000 (**mid-market households**) and 6% of households had investable assets of $500,000 or more (**affluent households**).

The majority of Canadian households do not own investment funds

The second relevant fact is that the majority of Canadian households do not own investment funds. At the end of 2012, 37% of Canadian households held investment funds[32] while the balance did not.

Mass-market households make up the largest share of those that do not own investment funds

Table 2: Household distribution by investment fund ownership

Breakdown of households by investable assets and fund ownership (base: fund ownership type)

Household Investable Assets	Household owns investment funds	Household does not own investment funds	% of total households
Up to $100k	39.4%	83.6%	67.2%
$100 - $500k	48.6%	14.2%	27.0%
Greater than $500k	12.0%	2.2%	5.9%
% of household ownership type	**100.0%**	**100.0%**	**100.0%**

Source: 2012 Ipsos Canadian Financial Monitor

By far, the majority of households that do not hold investment funds (84%) are those with investable assets of $100,000 or less.

[31] "Investable assets" include holdings of cash, GICs, bonds, stocks and investment funds. Only households with positive investable asset balances and households with total income below $30,000 that are holding cash in excess of 30% of household income are considered as possessing investable assets.

[32] Throughout this section, we look at holdings of investment fund products and fund wraps of all types including mutual funds, segregated funds, structured notes, principal protected notes, hedge funds etc. in order to get a sense of the entire investment fund and fund wrap market as utilized by Canadian households.

However, among investment fund owning households, the majority have relatively modest to moderate levels of accumulated financial wealth

Yet, like their share of Canadian households generally, mass-market and mid-market households made up the largest share of households that own investment funds.

At 2012, 39% of all households that owned investment funds were mass-market households, 49% were mid-market households, and the remaining 12% of fund owning households were affluent households.

Investment funds, like most securities, are more frequently owned by households with higher levels of accumulated financial wealth

The distribution of fund ownership, like the distribution of financial wealth generally, skews toward households with higher levels of investable assets.[33] Mass-market households appear underrepresented relative to their share of total households (i.e. only 39% of those households own funds despite comprising 67% of all households), while the opposite appears true for mid-market and affluent households. Investment funds, like most securities, tend to be a higher-wealth product.

Investment funds are less popular than traditional savings vehicles with mass-market households

Table 3: Household distribution by investable asset band

Breakdown of households by investable assets and fund ownership (base: household investable asset band)

Household Investable Assets	Household owns investment funds	Household does not own investment funds	% of households in investable asset band
Up to $100k	21.8%	78.2%	**100%**
$100 - $500k	66.8%	33.2%	**100%**
Greater than $500k	76.1%	23.9%	**100%**
% of total households	**37.1%**	**62.9%**	**100%**

Source: 2012 Ipsos Canadian Financial Monitor

We can see this lack of relative popularity more clearly when we look at the proportion of investment fund ownership across investable asset bands. Table 3 above provides the breakdown of the Canadian households that own investment funds (i.e. 37% of all households).

At the end of 2012, only 22% of mass-market households held investment funds. These households will typically hold more conservative financial products instead, such as cash, GICs etc. For mid-market and affluent households, the majority held investment funds at the end of 2012. 67% of mid-market households held investment funds and 76% of affluent households held investment funds at the end of 2012. Once again, investment fund ownership is less

[33] At the end of 2015, Investor Economics estimates that households with financial wealth below $100,000 held 7% of total financial wealth while those households with greater than $500,000 in financial wealth held 81% of total financial wealth in Canada (2016 Investor Economics Household Balance Sheet).

prevalent for households with modest levels of savings relative to households with higher levels of accumulated wealth.

Investment fund owning households with lower levels of accumulated wealth are less likely to state that they use advice

Table 4: Fund owning household distribution by investable asset band

Investment fund owning households by investable assets and advisor usage (base: household investable asset band)

Household Investable Assets	Use Advisor	Do not use Advisor	% of households in investable asset band
Up to $100k	45.0%	55.0%	**100%**
$100 - $500k	66.0%	34.0%	**100%**
Greater than $500k	72.4%	27.6%	**100%**
% of investment fund owning households	**58.5%**	**41.5%**	**100%**

Source: 2012 Ipsos Canadian Financial Monitor

Table 4 above provides a breakdown of the households that own investment funds (i.e. the subset of 37% of all households) and their use of an advisor[34].

As Table 4 highlights, the data suggests that advice usage tends to be more of a higher-wealth product. Its prevalence among investment fund owning households rises with the level of investable assets. At the end of 2012, only 45% of investment fund owning mass-market households stated that they used an advisor[35] while the majority of investment fund owning mid-market (66%) and affluent households (72%) used an advisor.

b. Investment Fund Distribution

Whether advised or not, households must purchase their investment funds through a dealer. A key piece of information needed in order to anticipate the possible market impact of the discontinuation of embedded commissions is an understanding of where investors access investment funds today. We will look at this question from a number of different angles and data sources, starting with the Ipsos Canadian Financial Monitor data.

In the tables below, we have grouped fund distribution by the following firm types:

- deposit-taker owned[36] fund distributors;
- insurer owned[37] fund distributors;

[34] The term “advisor”, as used in this Consultation Paper, is not indicative of an individual’s category of registration with Canadian securities regulators, but is rather a plain language term that is commonly used by the public, including fund industry participants and investors, to refer to a representative.

[35] Survey respondents said yes to the question, “Does anyone in your household use a financial planner / advisor to help manage his / her financial portfolio?” Note that this question is dependent on the respondent’s impression of whether or not they have an advisor. No specific definition of “advisor” was provided in the survey.

[36] We use the term ‘deposit-taker owned’ to refer to dealers or investment fund managers that are owned by deposit taking institutions including banks, credit unions and caisses populaires.

- independent[38] fund distributors; and
- other integrated[39] fund distributors.

In each of the tables, we take a closer look at where households that hold investment funds accessed their funds. Households may have multiple relationships with different types of fund distributors (e.g. a household may work with a deposit-taker and an insurer or a deposit-taker and an independent or just a deposit-taker etc.). We have cross-tabbed fund distributor types by grouping deposit-takers and insurers (the traditional integrated financial product distributors) together and independents and other distributors (the group traditionally labeled as independent fund dealers) together.

Note that households that have not purchased their funds through a deposit-taker/insurer or through an independent/other dealer have purchased their funds through an association[40] or have not identified where they purchased their funds.

Most households purchase their funds through a deposit-taker or insurer owned dealer

Table 5: Fund owning household distribution by fund dealer relationship

Households by relationship type (base: All investment fund owning households)

Relationship Type	Purchased from Independent/Other	Not purchased from Independent/Other	% of investment fund owning households
Purchased from Deposit-taker/Insurer	8.2%	78.5%	86.7%
Not purchased from Deposit-taker/Insurer	9.5%	3.8%	13.3%
% of investment fund owning households	**17.7%**	**82.3%**	**100.0%**

Source: 2012 Ipsos Canadian Financial Monitor

Deposit-taker and insurer owned fund dealers dominate fund distribution in Canada. At the end of 2012, of the 37% of households that owned investment funds, 87% purchased their funds through a deposit-taker/insurer owned distributor while only 18% purchased their funds through an independent/other fund distributor (a small percentage of households purchased their funds from both dealer groups).

[37] We use the term 'insurer owned' to refer to dealers or investment fund managers that are owned by or affiliated with an insurer.

[38] We use the term 'independent' to refer to dealers or investment fund managers that are not owned by deposit-takers or insurers and are not affiliated with an investment fund manager

[39] We use the term 'other integrated' to refer to dealers that are not owned by or affiliated with a deposit-taker or insurer but that are affiliated with an investment fund manager, or to investment fund managers that are not owned by or affiliated with a deposit-taker or insurer but that are affiliated with a dealer.

[40] The term 'association' refers to a dealer or investment fund manager that is owned by a trade or professional association.

Households with lower levels of accumulated wealth are less likely to purchase their funds through an independent dealer

Table 6: Mass-market household distribution by fund dealer relationship

Households by relationship type (base: fund owning households with up to $100k in investable assets)

Relationship Type	Purchased from Independent/Other	Not purchased from Independent/Other	% of fund owning households in asset band
Purchased from Deposit-taker/Insurer	5.3%	82.6%	87.9%
Not purchased from Deposit-taker/Insurer	8.8%	3.3%	12.1%
% of fund owning households in asset band	**14.0%**	**86.0%**	**100.0%**

Source: 2012 Ipsos Canadian Financial Monitor

Table 7: Mid-market household distribution by fund dealer relationship

Households by relationship type (base: fund owning households with $100k - $500k in investable assets)

Relationship Type	Purchased from Independent/Other	Not purchased from Independent/Other	% of fund owning households in asset band

Source: 2012 Ipsos Canadian Financial Monitor

Mass-market households are less likely to purchase their funds through an independent/other fund distributor. At the end of 2012, only 14% of mass-market households purchased their funds through an independent/other fund distributor compared to 18% of households overall and 21% of affluent households. Mass-market households were also much more likely to be solely purchasing their funds through a deposit-taker/insurer owned dealer (i.e. 83%) than were households with higher levels of investable assets (i.e. 76% and 75% respectively for mid-market and affluent households).

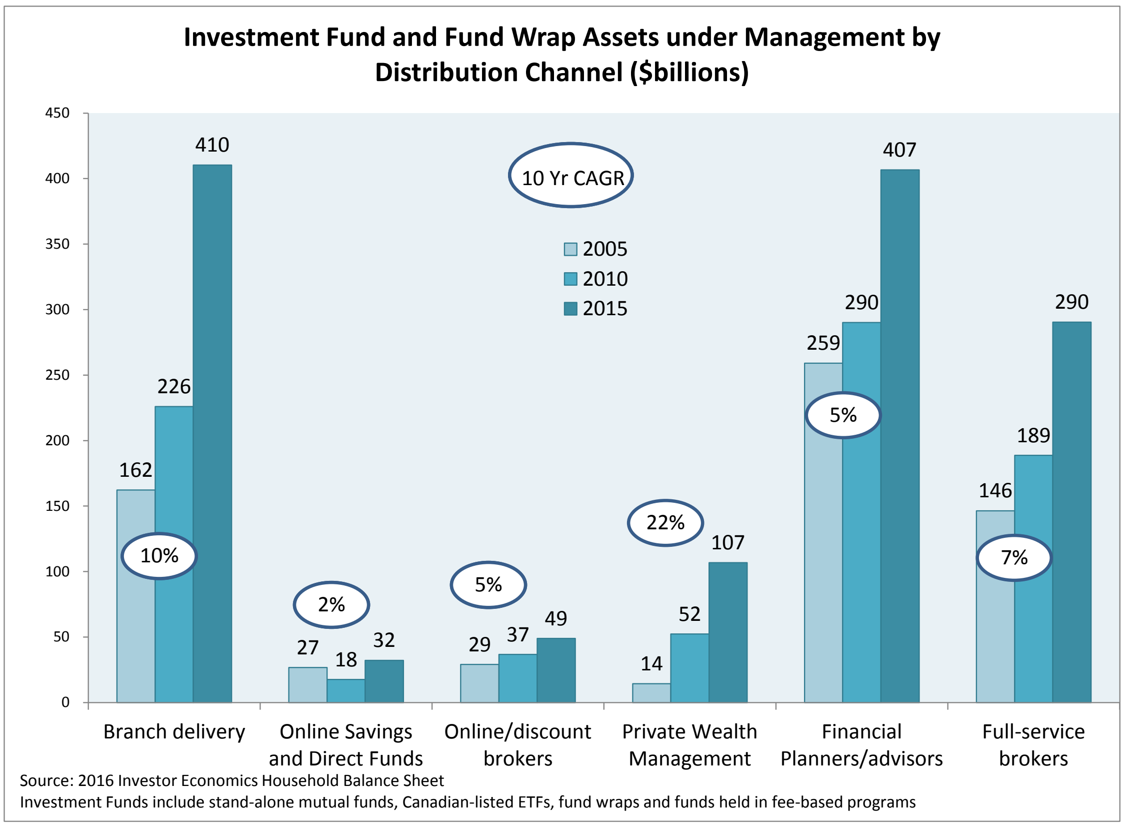
Fund distributors owned by deposit-takers and life insurers dominate investment fund distribution

Across all levels of investable assets, deposit-taker and insurer owned fund distributors tended to dominate fund distribution. The majority of households were working with a deposit-taker/insurer for at least one of their investment fund holdings (i.e. 88% for mass-market, 86% for mid-market and 87% for affluent households). Usage of deposit-taker/insurer fund distributors did not fall below 86% of households for all household types and for the industry as a whole. The data suggests that Independent/Other fund distributors tend to have a relatively small footprint in the market today.

These insights are also confirmed by data from Investor Economics.[41] In the two graphs below, we show investment fund and fund wrap assets, their 10 year compound average growth rates (CAGR) and market share for Investor Economics' six distribution categories – branch delivery, online savings and direct funds, online/discount brokers, private wealth management, financial planners/advisors and full-service brokers. We also highlight the change in market share for deposit-taker and insurer owned fund distributors in each channel.

Deposit-taker and insurer owned fund dealers dominate investment fund distribution today

Figure 2: Investment fund assets by distribution channel



As is shown in Figure 2 above, the majority of fund assets reside in the branch delivery channel and the financial planner/advisor channel.

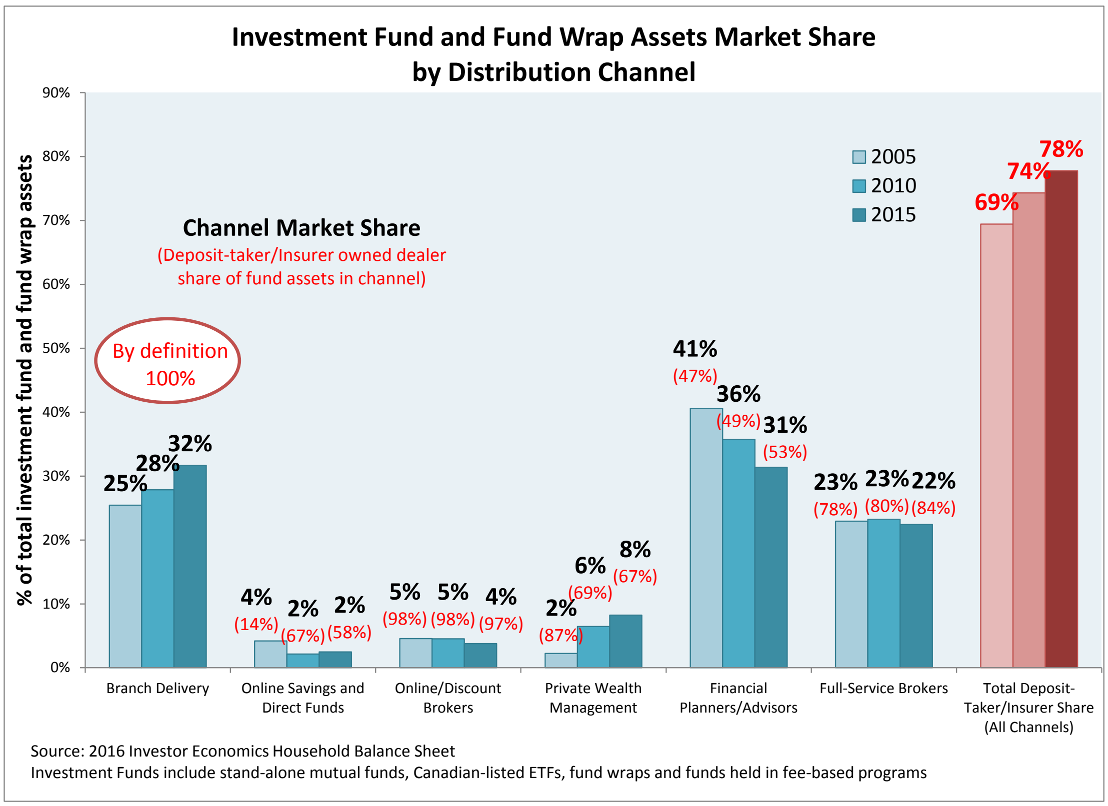
The branch delivery channel saw the second highest rate of fund asset growth over the last ten years (10%) after the private wealth channel (22%). This growth rate is particularly impressive given the size of the branch delivery channel 10 years ago.

---

[41] This data is similar to the Ipsos data in that it looks at investment fund distribution. Investor Economics also uses their own categorization for distributors which does not neatly line up and in some cases encapsulates groups outside of our registration categories.

The financial planner/advisor channel[42], which had possessed the largest share of investment fund assets ten years ago, was still the second most important distribution channel at the end of 2015 but had grown much slower than all but the online savings and direct funds and the online/discount brokerage channels. Investment fund asset growth in the financial planner/advisor channel was also slower (5%) than in the full-service brokerage channel over the period (7%). Growth of investment fund assets in the full-service broker channel in particular was driven by a number of factors including the growth in fee-based account usage and in the share of investment funds used in these accounts.[43]

Figure 3: Investment fund assets market share by distribution channel and dealer type



The relative growth of investment fund assets in the financial planner/advisor channel is noteworthy because this is where the majority of independent mutual fund dealers are captured. As shown in Figure 3 above, at the end of 2015, the financial planner/advisor channel was the only channel where the deposit-taker/insurer share of investment fund assets was below 55%. Although, even in that channel, there has been an increase in deposit-taker and insurer ownership over the last ten years, increasing from 47% to 53% of investment fund assets in the channel.

---

[42] The financial planner/advisor channel is probably the most heterogeneous of Investor Economics' distribution channels. It is made up of non deposit-taker mutual fund dealers, non-registered financial planning firms, insurance firms and some ‘fund-centric’ IIROC firms.

[43] Investor Economics, *Retail Brokerage and Distribution Advisory Service*, (various years) as well as data series from these reports requested by OSC staff.

As also highlighted in Figure 3, the branch delivery and full-service brokerage channels which had the second and third highest average annual growth over the last ten years, also had significant deposit-taker and insurer ownership at the end of 2015 (the former category is by definition 100% deposit-taker owned distribution).

At the end of 2015, the branch delivery channel held 32% of total investment fund assets, up from 25% ten years earlier. Much of that growth in market share came at the expense of the financial planner/advisor channel which saw its share of market decline from 41% to 31% over the period. The full-service broker channel saw its investment fund market share remain essentially constant while deposit-taker and insurer owned share of that channel increased from 78% to 84%. In total, at the end of 2015, deposit-taker and insurer owned dealers administered 78% of the investment fund and fund wrap assets held by Canadian households, up from 69% ten years earlier. In dollars, investment fund assets held through deposit-taker and insurer owned dealers, across all channels, increased from $443 billion in 2005 to $1 trillion at the end of 2015.

Next, we turn to data from the MFDA and IIROC in order get a sense of whether or not the insights from the Investor Economics and Ipsos data, which focused on investment fund distribution, carry over to retail securities distribution generally.

i. MFDA Channel

As outlined above in our review of the Ipsos Canadian Financial Monitor data and the Investor Economics Household Balance Sheet data, deposit-taker and insurer owned dealers have a strong market presence in the fund industry. This presence also extends across specific registration channels with deposit-taker and insurer owned dealers administering the largest share of assets in the MFDA and IIROC channels.

95% of assets in the MFDA channel are administered by integrated dealers[44]

Table 9: MFDA member assets and approved persons by dealer type[45]

MFDA Member Type	# Members	% of Total	Assets Under Admin $B	% of Total	# Approved Persons	% of Total
Independent	**60**	**61%**	**29.1**	**5%**	**3,399**	**4%**

Source: Mutual Fund Dealers Association at December 2015, OSC categorizations

[44] An “integrated dealer” is a dealer that is owned by or affiliated with an investment fund manager.

[45] In addition to the fund dealers which were members of the MFDA at the end of 2015, we note that there were also 21 mutual fund dealers in Québec that were not members of the MFDA and that employed 700 representatives. 71% of these dealers were independent and employed 83% of the representatives.

The MFDA channel is fairly concentrated and highly integrated. At the end of 2015, there were a large number of both integrated and independent firms in the channel with the majority of firms being independent of asset management. However, the majority of the assets in the channel and approved persons employed were at the integrated firms. At the end of 2015, integrated MFDA firms administered 95% of assets and employed 96% of approved persons in the channel.

90% of assets in the MFDA channel are administered by deposit-taker and insurer owned dealers

The 25 deposit-taker owned and insurer owned MFDA firms administered 90% of assets and employed 93% of approved persons. Independent/Other[46] MFDA firms, while making up 73% of firms in the channel, administered only 9% of assets and employed 6% of approved persons.

Independent MFDA dealers have tended to serve higher-wealth clients

Independent MFDA dealers have tended to serve higher-wealth clients while deposit-taker/insurer owned firms have tended to serve all client types.[47] Deposit-taker/insurer owned dealers had traditionally focused on clients with investable assets up to $250,000 but have increasingly focused on more affluent clients. Typically, mass-market clients will be serviced by front line representatives at the branch, while those with investable assets above $100,000 will be serviced by 'financial planners'[48] at the branch. Clients with assets above $1 million or more will typically be referred to the related IIROC dealer or the related private wealth management arm for service.

For independent/other MFDA firms, typically they will not take on clients unless they have at least $100,000 in investable assets. This information, coupled with our analysis of the Ipsos data, suggests that the majority of households (particularly mass-market households) will be working with a deposit-taker or insurer owned MFDA dealer.

[46] Similar to the Ipsos analysis, "Other" MFDA firms refer to dealers that are owned by non-deposit-taker and non-insurer asset managers. We group Independent and Other firms together here as this is typically what commentators refer to as 'independent' fund distributors.

[47] Information in this section comes from Investor Economics *Retail Brokerage Reports* as well as OSC review of mutual fund dealers.

[48] Financial planners within the branch will typically have attained a financial planning qualification such as the Personal Financial Planner (PFP) designation through the Canadian Securities Institute, the Certified Financial Planner (CFP) designation through the Financial Planning Standards Council or the *Institut québécois de la planification financière*.

The majority of assets in the MFDA channel today are administered by dealers that focus on proprietary funds

Given that the majority of integrated mutual fund dealer firms limit their product shelf primarily to proprietary products[49], this restriction also implies that the majority of mass-market households are primarily sold proprietary products. At the end of 2015, 69% of assets in the MFDA channel were held at dealers that focused primarily on proprietary products.

The majority of investment fund owning mass-market households are working with representatives that are not compensated by commissions

For many integrated fund dealers and in particular for the deposit-taker owned fund dealers, compensation for the representative is not derived from commissions but rather through non-activity based transfer payments from affiliated corporate entities.[50] Given that deposit-taker owned fund dealers administered 60% of the assets and employed 64% of approved persons in the channel at the end of 2015 and that these firms tend to service the majority of households with modest levels of investable assets, the majority of mass-market investors today are working with representatives that are not compensated via embedded commissions.

ii. IIROC Channel

95% of retail assets in the IIROC channel are administered by integrated firms

Table 10: IIROC member assets and approved persons by dealer type

IIROC Member Type*	# Members	% of Total	Assets Under Admin $B	% of Total	# Approved Persons	% of Total

Source: Investment Industry Regulatory Organization of Canada at December 2015, OSC categorizations

*Note: Only IIROC members categorized as Retail, Managed Account, Integrated and Discount Broker are included. Total assets for each firm include both retail and institutional client assets.

[49] MFDA dealers with 80% or more of their mutual fund assets held in funds managed by an affiliate were considered proprietary only.

[50] See the discussion in MFDA Bulletin #0689-P, supra note 24 for an explanation.

The IIROC channel also has a wide range of both integrated and independent dealers. At the end of 2015, integrated IIROC firms administered 95% of assets[51] and employed 89% of approved persons in the channel. Independent dealers – when one includes the 'other integrated' dealer category, made up 80% of firms, administered 20% of assets and employed 32% of approved persons at the end of 2015. Deposit-taker and insurer owned dealers, while only making up 18% of firms, administered 79% of assets and employed 66% of approved persons.

The IIROC channel is almost entirely "open shelf" today

While slightly less concentrated among integrated dealers than the MFDA channel (where independent and other integrated firms administered 10% of assets) the IIROC channel is still dominated by the deposit-taker owned dealers. Where the two channels differ is with respect to the level of related party product distribution. While the deposit-taker and insurer owned MFDA firms primarily distribute proprietary funds, their counterparts in the IIROC channel are primarily open shelf largely due to the types of representatives employed in this channel. Almost 100% of integrated IIROC firms offer proprietary and third party products. IIROC representatives also have more flexibility and are able to offer a wider variety of security types. Therefore, IIROC representatives tend to be more independent than their MFDA counterparts, even if they are working for a firm that offers their own mutual funds, making them and the whole channel less focused on the sale of proprietary products including proprietary funds.[52]

Deposit-taker-owned IIROC dealers also tend to differ in their methods of compensating representatives relative to their mutual fund dealer peers owned by deposit-takers. Representatives employed by deposit-taker owned IIROC dealers tend to be compensated via commission grid while their counterparts at deposit-taker owned MFDA dealers are typically compensated via salary plus a performance bonus which may impact the way in which the firm can incent behavior in the two channels.

IIROC representatives also tend to be more selective regarding their clientele. IIROC dealers typically aim to service households with investable assets of $500,000 or more, although some IIROC dealers will service clients with lower investable assets.[53] This fact, coupled with what we have highlighted from the Ipsos data, suggests that the potential market for the IIROC channel is roughly 6% to 14% of households. These households are typically the wealthiest

[51] IIROC representatives may deal in a wider range of securities compared to dealer representatives in the MFDA channel, thus assets here will include not only mutual funds but also equities, fixed income, ETFs and in some cases options and other derivatives.

[52] Information in this section comes from Investor Economics and the CSA review of advisor compensation practices. See for example, the following main stories from Investor Economics, *Retail Brokerage and Distribution Advisory Service*: "Investment fund attraction still strong in full-service brokerage channel," Spring 2011; "Accessing today's and tomorrow's distribution paradigm," Spring 2012; "Profitability Update: Gauging the Changing Influence of Revenue Costs and Compensation on the Industry's Bottom Line," Summer 2012; "Branch Advice: Managing Growth and Success into the Future," Fall 2012; "Mutual Funds in Full-service Brokerage—Either Ride the Fee-based Wave or Be Pulled Under by It!," Summer 2016.

[53] Investor Economics, *Retail Brokerage Report*, Winter 2012.

households in Canada which is one of the reasons why retail assets under administration in this channel are over three times the size of assets in the MFDA channel. The IIROC channel administers more assets but services fewer households than the MFDA channel.

Table 11: Combined MFDA and IIROC member assets and approved persons by dealer type

Investment Industry Regulatory Organization of Canada at December 2015, OSC categorizations
*Note: Only IIROC members categorized as Retail, Managed Account, Integrated and Discount Broker are included. Total assets for each firm include both retail and institutional client assets.

We can see that in total, 95% of the assets under administration in Canada are administered by integrated firms. 16% of these assets are administered by dealers that primarily offer proprietary products. As explained above, dealers that only offer proprietary products are concentrated in the MFDA channel. Deposit-taker and insurer owned dealer firms administered 81% of the assets and employed 87% of approved persons. We also note that, at the end of 2015, there were 106,647 registered representatives just in the MFDA and IIROC channels alone[54] servicing a total population of 35.8 million Canadians. This equates to one representative for every 336 Canadians.

By way of comparison, in 2011, the year before the Retail Distribution Review (**RDR**) reforms were implemented in the United Kingdom (see Appendix C for an overview of the RDR reforms), there were 40,566 advisers registered[55] servicing a total population of 63 million (one advisor for 1,553 people) and only 21% of these advisers were employed by a bank or building society.[56]

---

[54] This does not include portfolio manager and exempt market dealer registrants, although it is fair to say that this number would cover retail securities advice. Note that we have also not included those registered to sell insurance.

[55] Association of Professional Financial Advisers, *The Financial Adviser Market: In Numbers*, 2015, page 5, http://www.apfa.net/documents/publications/financial-adviser-market/apfa-the-financial-adviser-market-in-numbers-v4.0.pdf.

[56] If Canada was to see the same post-ban decline that was experienced in the U.K. - a 23% decline, 3 years after the ban - we would still have a representative coverage rate close to four times the rate per capita in the U.K pre-RDR.

This comparison suggests that Canadian investors currently have access to a relatively large number of representatives, particularly in the deposit-taker owned channel. 63% of the representatives were employed by a deposit-taker owned dealer and a further 24% were employed by an insurer owned dealer.

It also suggests that the distribution landscape in Canada is relatively more concentrated and vertically integrated than is the distribution landscape in the United Kingdom.[57]

In the next section, we take a closer look at the online/discount brokerage channel – the non-advised market for funds.

iii. Online/Discount Brokerage Channel

Table 12: Online/discount brokerage assets under administration

Online/Discount Brokerage Channel

$Millions	Dec 2011	Dec 2012	Dec 2013	Dec 2014	Dec 2015
Investment Fund Assets held in Online/Discount Brokerage	38,706	42,607	47,398	55,109	56,516
Total Online/Discount Brokerage Assets under Administration	231,560	254,480	292,606	324,665	330,448
Investment Fund % Share	17%	17%	16%	17%	17%

Source: Investor Economics

The online/discount brokerage channel shows a lower use of investment funds relative to other channels. As shown in Table 12 above, investment funds' share of total assets in the online/discount brokerage channel has been constant over the last five years, remaining at approximately 17% of channel assets over that period. In contrast, investment funds' share of assets in the financial planner/advisor and branch delivery channels stood at 78% and 33% respectively of channel assets at December 2015.[58] In total, there was $330 billion held by do-it-yourself (**DIY**) investors in the online/discount brokerage channel at December 2015.

ETFs have become more popular over time with DIY investors

Table 13: Investment funds in the online/discount brokerage channel

Online/Discount Brokerage Investment Funds

$Millions	Dec 2011	Dec 2012	Dec 2013	Dec 2014	Dec 2015

Investment Funds Total	**38,706**	**42,607**	**47,398**	**55,109**	**56,516**
ETF % Share	33%	39%	41%	46%	47%

Source: Investor Economics

[57] For example, at 2012, before RDR was introduced, bank and insurer owned advisory firms serviced only 41% of advised individuals. See, Deloitte, *Bridging the advice gap: Developing investment products in a post-RDR world* (2012), https://www2.deloitte.com/content/dam/Deloitte/uk/Documents/financial-services/deloitte-uk-fs-rdr-bridging-the-advice-gap.pdf.

[58] Investor Economics, 2016 Household Balance Sheet, page 141.

ETFs have always been popular with DIY investors and they have become more popular over time. While the share of investment funds held within the online/discount brokerage channel has remained steady, DIY investors' preference between mutual funds and ETFs has moved in favour of ETFs over time. At December 2015, DIY investors held $30 billion in mutual funds and $26 billion in ETFs. ETF assets owned by DIY investors have more than doubled since December 2011 and as a share of total assets in the online/discount brokerage channel, ETFs increased from 33% to 47% over the period.

Canadian ETF managers must compete with their U.S. domiciled peers while Canadian mutual fund managers do not

Table 14: ETFs held in the online/discount brokerage channel

Online/Discount Brokerage Exchange Traded Funds (ETF)

$Millions	Dec 2011	Dec 2012	Dec 2013	Dec 2014	Dec 2015
ETFs Canadian Domiciled - Common Share Class	9,459	12,474	13,947	17,897	18,695
ETFs Canadian Domiciled - Advisor Share Class	42	58	61	75	67

% Passive	97%	95%	94%	94%	92%
% Foreign Domiciled	25%	24%	28%	29%	29%

Source: Investor Economics

Unlike investment fund managers of conventional mutual funds in Canada, investment fund managers of ETFs in Canada must compete both within the Canadian market and compete with ETFs domiciled in other markets, primarily the U.S. market.[59]

DIY fund investors buy both Canadian domiciled and U.S. domiciled ETFs. At December 2015, Canadian DIY investors held $19 billion in Canadian domiciled ETFs and $8 billion in U.S. domiciled ETFs – fully 29 cents of every dollar invested in ETFs by DIY investors is invested in U.S. domiciled ETFs.

ETFs held in the online/discount brokerage channel are overwhelmingly passively managed

In contrast to the conventional mutual fund space, passively managed funds make up the largest share of assets. At December 2015, passively managed ETFs made up 87% of the Canadian domiciled ETF market. This preference for passively managed products is even more prevalent for Canadian DIY investors investing in ETFs. At December 2015, 92% of ETF assets were held in passively managed ETFs although that market share has declined over the last five years as more actively managed ETFs have entered the market.

[59] In many cases, these investment fund managers may be competing with their own products in these other markets.

The majority of DIY investors investing in mutual funds pay full trailing commission despite not receiving advice

Table 15: Do-it-yourself mutual funds

Low Cost/Discount Brokerage Fund Series (Series D)

$Millions		Dec 2011	Dec 2012	Dec 2013	Dec 2014	Dec 2015
Mutual Funds (Series D)	Total	10,746	10,705	10,752	11,961	11,957
	% Passive	6%	9%	12%	14%	16%

Estimated amount of Series D in the Online/Discount Brokerage at the end of 2015 - 4.6 Billion
Source: Investor Economics

If we look more closely at the types of mutual fund series sold through the online/discount brokerage channel, we see that the majority of fund series sold are the full trailing commission fund series despite the increased availability of Discount/DIY fund series (typically denoted "D" series) [60] in the market. Consequently, many DIY mutual fund investors in the online/discount brokerage channel indirectly pay for services they do not receive.

Assets held in the Discount/DIY mutual fund series are however slowly increasing. These assets totaled $12 billion at December 2015 up from $11 billion in December 2011, although by the most recent estimate, the majority of these assets were not held in the online/discount brokerage channel. At the end of 2015, it is estimated that out of the total $12 billion of Discount/DIY fund series assets, only $4.6 billion was actually held in the online/discount brokerage channel.[61] This data suggests that $25 billion of the total $30 billion held in mutual funds in the channel (83%) remains in the full trailing commission paying fund series.

As is the case for many DIY mutual fund investors in the online/discount brokerage channel, there are also some DIY ETF investors that indirectly pay trailing commissions without receiving advice because they hold the trailing commission paying "Advisor" class units of the ETF.[62] However, the amount of assets held in these "Advisor" class units is relatively low (only

---

[60] Some investment fund managers offer a series (typically Series D) of their funds that is designed for Discount/DIY investors. These fund series pay a much lower trailing commission than do the traditional full service retail series (typically 25 bps compared to 100 bps for the traditional full service retail series of an equity fund) to account for the fact that no advice is provided to investors in the online/discount brokerage channel. This is further discussed in Appendix A.

[61] Investor Economics estimate. The remaining $7.4 billion of DIY series assets was purchased directly by investors outside of the online/discount brokerage channel.

[62] Advisor class units that are offered by some ETF providers are designed for advised investors and are meant to be purchased through an advisor. The only difference between this class of units and the common class units is the trailing commission component (or alternatively denoted the "service fee" component) embedded in the management fee of the Advisor class.

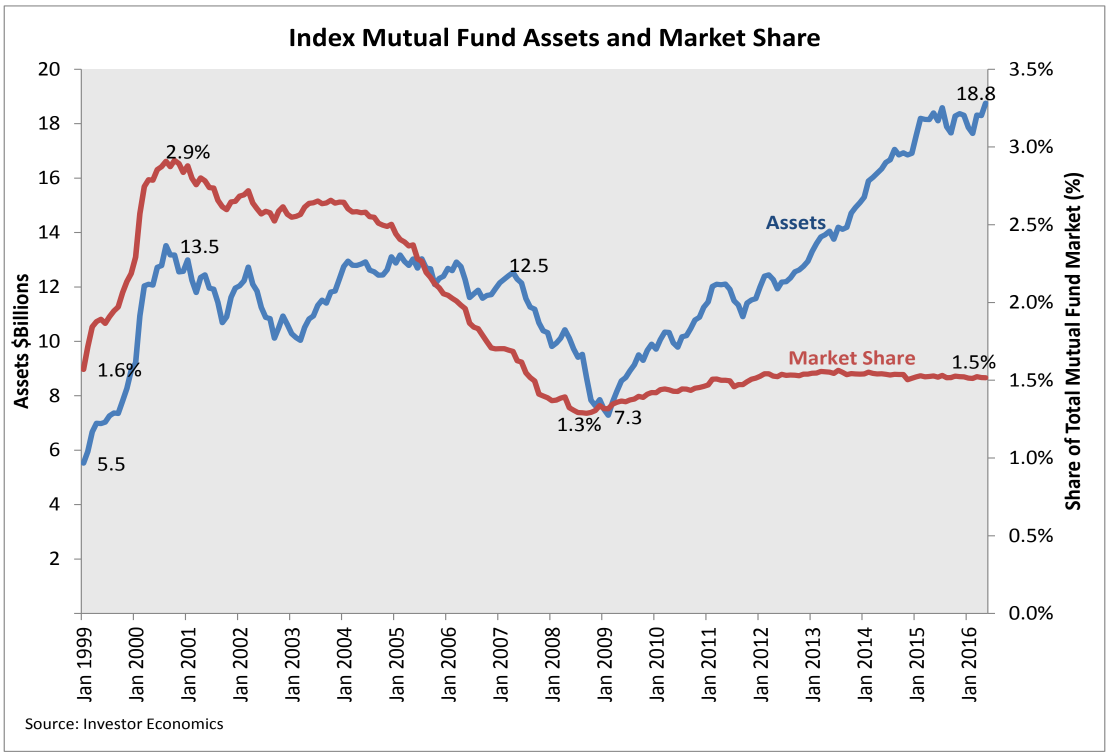
We do not know if these holdings of Advisor class units in the online/discount brokerage channel are a consequence of previously advised assets transferring in or are due to investor error. However, we note that some discount brokerages do make Advisor class units available for trade on their platforms.

$67 million at December 2015) in comparison to the share of full trailing commission paying mutual funds in the online/discount brokerage channel.

Finally, we note that unadvised fund investors as a group (those buying Discount/DIY fund series) have a higher share of assets invested in passively managed mutual funds relative to advised mutual fund investors.

At the end of 2015, 1.5% of total mutual fund assets (excluding ETFs) were held in passively managed funds. Index fund market share has remained essentially unchanged over the last 10 years. However among the relatively new Discount/DIY fund series, index funds made up a much larger share of assets (16% or $2 billion) that has been growing steadily over time.[63]

Figure 4: Index mutual funds in Canada



We now turn our attention to some important facts about investment fund managers.

[63] Some have argued that while index mutual fund ownership among advised investors is perennially low in Canada, index fund usage by Canadians is substantially higher when one includes the index-tracking ETFs held by Canadians. In fact, within the full service brokerage channel, of the $47 billion in ETFs held in this channel only $17 billion was held by clients of commission-based advisors (not all of which was held in index tracking ETFs). The remaining $29 billion was held by clients of fee-based advisors. Source: Investor Economics ETF and Index Fund Report 2016 Q2.

c. Investment Fund Management

Mutual funds are by far the dominant type of investment fund sold in Canada today. This has been the case since organized investment fund asset monitoring in Canada started in the early 1990s. At the end of 2015, Canadians held $1.2 trillion in mutual fund assets, $90 billion in ETF assets, $110 billion in segregated fund[64] assets, $172 billion in group segregated fund assets, and $199 billion in pooled fund, closed end funds and alternative fund assets. Although there have been articles at various times in the past regarding the growth of ETFs and segregated funds, and despite impressive annual growth rates for ETFs, the dominance of mutual funds has never been challenged in a significant way. [65]

Figure 5: Investment funds by fund type

Source: Investor Economics, SEDAR, SEC Filings at December 2015. OSC Categorizations

Similar to what we found with the Ipsos, Investor Economics, IIROC and MFDA data, the investment fund manager market in Canada is dominated by the deposit-taker and insurer owned fund managers. At the end of 2015, integrated investment fund managers[66] made up 42% of the firms but managed 78% of mutual fund assets. Deposit-taker and insurer owned investment fund managers managed 64% of the mutual fund assets. We also note that 73% of all mutual fund assets were managed by the 10 largest investment fund managers in Canada.[67]

While asset management is concentrated among the deposit-taker and insurer owned investment fund managers, it is relatively less concentrated than distribution where deposit-taker and insurer owned dealer firms administered 81% of assets in the combined IIROC and MFDA channel. Using the traditional definition of independent investment fund manager which would encompass both 'Independent' and 'Other Integrated' investment fund managers, these firms managed 34% of industry assets.

[66] An "integrated investment fund manager" is an investment fund manager that is affiliated with at least one dealer.

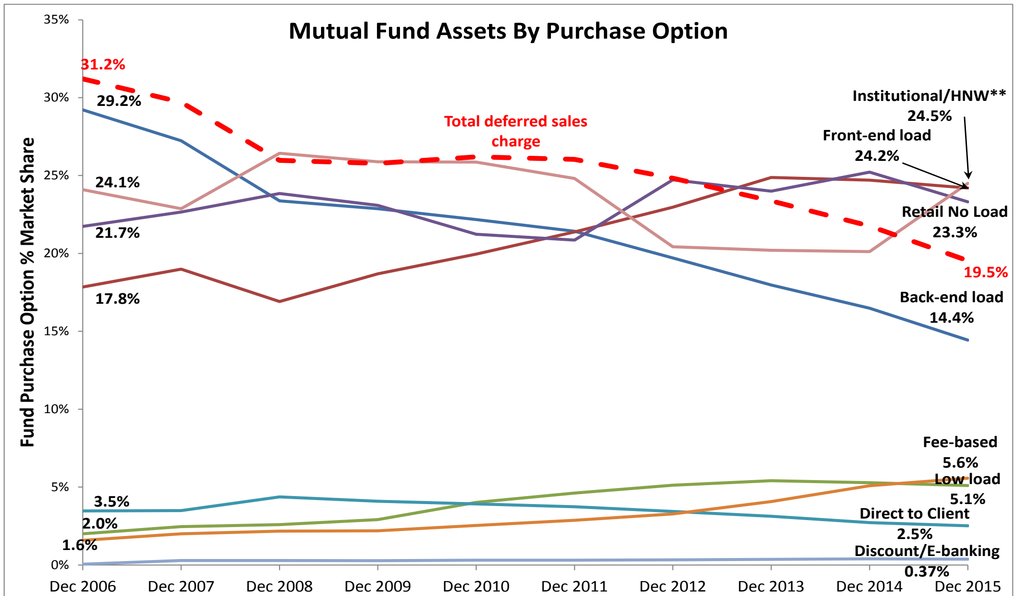
**This category is reported as a residual to remove double-counting of the assets used in fund-of-fund products. Due to data constraints, assets held by high net worth investors cannot be broken out from assets held by true institutional investors.

25% of mutual fund assets (net of wrapping) are held in institutional/high net worth series

Figure 7: Mutual fund market share (ex-ETFs) by purchase option



Source: Investor Economics (various surveys)
Load assets estimated from survey data collected from 19 fund companies representing 76% of industry assets
**This category is reported as a residual to remove double-counting of the assets used in fund-of-fund products. Due to data constraints, assets held by high net worth investors cannot be broken out from assets held by true institutional investors.

We update fund assets by purchase option, a graph included in the Original Consultation Paper, to show how fund purchase options have changed over the last few years.[68]

In terms of the types of fund purchase options available in the industry today, the institutional/high net worth (**HNW**) purchase option, which typically does not pay trailing commissions, made up the largest share of fund assets totaling $302 billion or 25% of market at December 2015. HNW fund series assets have grown by 51% over the last five years.

The majority of mutual fund assets are still held in traditional fund series that include embedded commissions

The front end purchase option[69]was the second largest purchase option by assets with $298 billion or 24% of market at the end of 2015, growing 93% over the previous five years.

The retail no load purchase option – the option commonly offered within the branch network and through some vertically integrated fund managers – was the third largest purchase option by assets at $287 billion at December 2015, making up 23% of the market and growing 70% over the last five years.

The back-end load and low-load purchase options, which are both a form of DSC purchase option, remained a large component of industry assets at the end of 2015. Though DSC options have been falling in terms of market share, assets in these series continue to grow.[70] In total, $241 billion was held in DSC options at the end of 2015, and these options grew 19% over the last five years (largely due to the growth of low load fund series assets which grew 101% over the last five years versus 3% for traditional back-end load series).[71]

It is still the case that trailing commission paying fund series make up the bulk of mutual fund assets in Canada. At the end of 2015, trailing commission paying purchase options – back-end, low load, front end, and retail no load – made up 67% of assets and increased by 58% over the five years ending 2015.

---

[68] CSA Discussion Paper and Request for Comment 81-407 *Mutual fund fees*, (2012), 35 OSCB, page 11248.

[69] Although there are reports that many front end load funds are sold with 0% commissions, this is based on surveys of investment fund managers rather than fund distributors. We still see many front end fund sales with commissions in the market today. We would expect front-end sales commissions to continue to be charged in order to reflect factors such as differences in the scope and timing of advice and services provided, and the experience and skill level of the advisor, etc.

[70] The decline in market share also masks its importance to certain investment fund managers and fund dealers where DSC share of firm assets can be as high as 80% or more.

[71] The Canadian fund market is unique in its relative reliance on DSC and low load options. While making up 20% of mutual fund assets in Canada today, these options make up less than 1% of mutual fund assets in the United States and Europe.

A small, but fast growing, share of mutual fund assets are held in fee-based purchase options

Fee-based purchase options remain a very small part of the mutual fund market, but they are growing quickly. Fee-based fund series made up only $69 billion or 6% of industry assets at the end of 2015. However, fee-based assets had the highest rate of increase over the five years ending 2015, increasing by 248%.

Fee-based options, while growing quickly, remain a small part of the mutual fund market as these purchase options are not available to all investors in all channels.

Not all purchase options are available to all investors in all channels

Given the number of series and purchase options available in the market, it may seem that investors are provided a wide range of purchase options.[72] However, not all (or in some cases not many) purchase options are made available to all investors in all channels.

Figure 8 below lays out the availability of fund purchase options in Canada using the information previously discussed regarding the MFDA and IIROC channels and data from Investor Economics, Morningstar, and Ipsos. Availability of products and purchase options tend to vary by the level of investable assets, by distribution channel, and by distributor type.

Mass-market households will typically choose between the purchase of proprietary funds with advice[73] or the full universe of fund products (and securities generally) with no advice, and may have limited access to certain other purchase options, such as fee-based options.

Dealers that offer an open shelf of fund products typically service investors with $100,000 or more in investable assets. Investors that do not want proprietary funds may have to forgo advice and purchase through a DIY channel. As previously discussed, despite the availability of Discount/DIY purchase options, the majority of online/discount brokerage channel purchase options will be sold under the no load or front end (with front end commission waived) options with the same rate of trailing commission paid as the fully advised channel.

Fee-based purchase options are typically not available for mass-market households. In terms of the purchase options available to mass-market households, all purchase options (no load, DSC purchase options and front end load) *except* for fee-based options are generally available. If the fund investor is investing through a deposit-taker owned mutual fund dealer, the investor will typically be offered a no load purchase option. If the investor is working with an insurer owned mutual fund dealer, the investor will typically be offered front end, no load and DSC purchase options. Fund investors with little to invest are the most likely to be offered DSC purchase

[72] See page 1 of Investment Funds Institute of Canada, *Paying for Advice: Why Options are Important*, August 2014 for example.

[73] We note that there tends to be more variation with respect to the use of proprietary products across insurer owned fund dealers relative to deposit-taker owned fund dealers, with some offering primarily proprietary products and others offering a wider universe of both proprietary and non-proprietary products. However, it is not clear that insurer owned fund dealers offering a wider universe of products target mass-market households.

options and some firms primarily offer their clients DSC options.[74] The dealer will typically choose which purchase options to make available and if multiple options are made available, the representative will choose which of these options are presented to the client depending on their needs and the representative's revenue requirements.

Fund investors typically gain access to advice and a wider range of product options as their investable assets increase. For mid-market households, those with investable assets between $100,000 and $500,000, there will be a wider range of products and types of advisor available. These investors can choose to invest through a deposit-taker owned or insurer owned mutual fund dealer focused on proprietary products or an independent mutual fund dealer offering the full universe of fund products.[75] They will also be able to invest in a wider range of investment fund and non-investment fund securities through an IIROC dealer.

Fee-based purchase options have historically been limited for mid-market households, although access to these options has begun to increase recently.[76] When purchasing through a deposit-taker owned mutual fund dealer, mid-market households will typically be offered a no load option. When purchasing through other mutual fund dealers or through independent IIROC dealers, mid-market households will typically be offered front end, no load and DSC options.

These investors also have the option of foregoing advice and choosing to purchase their funds directly without trailing commissions through direct-to-client purchase options[77] offered by some investment fund managers.

Those with large amounts of investable assets get access to advice, product options and a broader choice in purchase options. Affluent households, those with investable assets above $500,000, have access to all purchase options, product options and advisory options available in the market. They can access a fee-based or commission-based advisor who can offer them the universe of fund products (and other securities), or they can choose to work with a traditional commission-based mutual fund dealer (who may also be a financial planner). Investors with $1 million or more in investable assets can also work with a deposit-taker owned portfolio manager and those

---

[74] We note that one of the largest integrated firms in Canada recently announced that they will discontinue offering the DSC option. See Rudy Luukko, "Investors Group will eliminate deferred sales charge option", *Morningstar Canada*, September 19, 2016. We estimate that, based on assets at December 2015, this change will impact 25% of total assets held in the DSC option.

[75] Although open shelf fund dealers can offer the full universe of fund products, they will typically focus on a subset of funds from a smaller list of preferred fund families. See for example, the 2015 Environics Advisor Perception Study (http://environicsresearch.com/wp-content/uploads/2016/02/Infographic-E_FINAL.pdf).

[76] See for example, Rudy Mezzetta, "Credential introduces fee-based product for mutual fund advisors", *Investment Executive*, January 26, 2016, and Rudy Luukko, "Investors Group eases into fee-based investing", *Morningstar Canada*, November 22, 2016. We also note that other deposit-takers have recently been slowly rolling out fee-based options within their branch networks.

[77] Purchase options that are offered by an investment fund manager that sells investment funds directly to investors through a related mutual fund dealer via online or telephone access.

with investable assets above $500,000 can work with an independent portfolio manager firm directly, typically through a fee-based arrangement.[78]

We have provided data and our analysis of the mutual fund and securities market in Canada today. In the next section, we look at the anticipated effects if we transition away from embedded commissions.

[78] We note that the number of households working directly with portfolio managers is relatively low (i.e. below 200,000 households or less than 1% of all households). These firms also vary considerably in their usage of investment funds.

2. ***Overall market impact of the discontinuation of embedded commissions***

For the discussion that follows, unless otherwise indicated, we assume that the market has transitioned away from embedded commissions and that current details about the market hold.

We also assume that the requirements in CRM2 and POS are fully implemented, and where applicable, we discuss the implication of potential intersections between the discontinuation of embedded commissions and the proposals set out in CSA CP 33-404.

i. Reduction in fund series and in fund fee complexity:

We anticipate that the number of fund series available in Canada would significantly decline as a result of a transition away from embedded compensation. As also discussed in Appendix A, this effect is expected because the vast majority of fund series available in the market today differ only by the level and type of embedded compensation paid to the dealer.[79] The transition away from embedded commissions would make these series redundant given the embedded commission free fund series (i.e. series F and high net worth fund series) that are already available today.

Based on figures from Morningstar Direct at February 2016, if we were to eliminate the fund series that include some form of embedded compensation from the market today, the total number of fund series would fall from 13,899 to 4,901 – a 65% decline. This would significantly simplify fund fee structures which are currently very complex and difficult for investors to understand, as shown in Part 2. Fund series that remain would be larger on average after the change. For example, using total industry assets at December 2015 ($1.2 trillion) and the number of fund series that we estimate would remain after the discontinuation of embedded commissions if it were to take immediate effect today (4,901), average assets per fund series would rise from $86.6 million to $245.5 million – a 184% increase. We anticipate that this impact alone could drive down fund costs.[80]

[79] In addition to the number of fund series available, some fund series are available for purchase under more than one purchase option (e.g. back end, low load, front end purchase options available within one fund series). Taking into account available purchase options, there were 39,848 unique mutual fund series/purchase option combinations available in Canada (source: FundSERV - mutual fund and fund wrap products) at the end of June 2016 and a total of $1.3 trillion ($999 billion USD) invested in mutual funds (source: Investor Economics) at the end of June 2016. In contrast, there were 32,555 unique fund series/purchase option combinations available in the United States (source: Morningstar Direct) at the end of June 2016 and a total of $15.9 trillion invested in mutual funds (source: Investment Company Institute) at the end of June 2016.

[80] We also note that in some cases, investment fund managers today charge management fees on their series F that are less than the management fees net of trailing commission for their retail – trailing commission paying - series. If this pricing differential were to persist after the discontinuation of embedded commissions, then we would also expect to see a decline in fees from this as well. We also note that some investment fund managers, recognizing the extent of the complexity and confusion in the market, have already begun to rationalize their series offerings in order to simplify the cost structures for advisors and investors and to reduce price discrimination (see for example R. Luukko, "RBC flexes its muscle on fund fees", *Morningstar Canada*, February 29, 2016; J. Hemeon, "TDAM lowers management fees on certain funds series", *Investment Executive*, November 22, 2016).

Accompanying the simplification and standardization of fund series would be a simplification of, and amendments to, fund disclosure documents (fund facts, simplified prospectus, management report of fund performance, etc.). We do not anticipate significant cost implications arising from these amendments to fund disclosure documents.[81] Rather, we anticipate that any costs incurred would be offset by significantly lower ongoing fund series maintenance costs (in terms of both disclosure documents and marketing materials).

We do not anticipate that any switches between series of the same fund that may occur as a consequence of the simplification of fund series would have any financial or tax implications for fund investors because, as is the case today for switches between fund series of the same fund, these switches would not be considered a deemed disposition for tax purposes.

We do anticipate that, as is the case today with switches between series of the same fund, this activity will generate many in-kind transactions or book adjustments on client account statements that may require a conversation between the advisor and client to explain the occurrence or may be accompanied by a notice from the investment fund manager and/or fund dealer. Each would entail one-time costs.[82]

ii. *New lower-cost product providers may enter the market:*

We anticipate that new lower-cost product providers would enter the mutual fund market after a transition away from embedded compensation. Some lower-cost mutual fund providers have expressed to the CSA the view that embedded commissions function as a barrier to market entry.[83] We anticipate that these new product providers would enter the market with a wide range of passively and actively managed mutual funds.

Based on an analysis of low-cost fund product provider pricing in other markets,[84] while taking into account pricing practices specific to Canada (e.g. tax differences such as the HST etc.), the

[81] We anticipate these amendments to include only deletions from current disclosure documents and significant simplification and removal of sections such as the dealer compensation from management fee section, etc. We anticipate that investment fund managers will choose to merge assets into existing, and likely repriced, fund series rather than launch new series.

[82] We anticipate that these costs would be incurred in any case as the representative and client would need to communicate and agree on a direct pay arrangement going forward.

[83] See for example the transcript of OSC Roundtable Re Discussion Paper and Request for Comment 81-407 *Mutual Fund Fees* (June 7, 2013) at p.98 - Question from Commissioner Deborah Leckman to Atul Tiwari, Managing Director/Head of Canada for Vanguard Investments, infra note 201. Other evidence that embedded commissions inhibit competition by creating barrier to entry is provided in Appendix A.

[84] The estimates for low-cost manager pricing come from a cross-sectional regression of non-institutional management fees and MERs controlling for fund size, domicile (U.S., Canada, U.K. Ireland, Australia), product structure (ETF or mutual fund), broad asset class and management type (active or passive). Current fee-based fund series pricing is for the Canadian fund market only. Currently, the average fixed income fund fee-based series MER in Canada is 48 bps for an index tracking fund and 92 bps for an actively managed fund. The average equity fund fee-based series MER in Canada is 77 bps for an index tracking fund and 124 bps for an actively managed fund. All data is sourced from Morningstar Direct at July 2016.

estimates suggest that management expense ratios (**MER**) for index funds offered by these new entrants could be up to 40 bps lower than average index fund costs today. Also, MERs for actively managed funds offered by these new entrants could be up to 75 bps lower than average actively managed fund costs today.

Aside from certain large low-cost product providers, it may be possible for smaller emerging asset managers that have a good track record of risk-adjusted performance to enter the mutual fund market (either through a public fund launch or through a sub-advisory relationship) after the transition away from embedded commissions. Those managers that offer a distinct mandate or a niche style - a comparative advantage – could have a greater chance of success in a post trailing commission world as they would compete on their performance without the trailing commission factor.

iii. Increased price competition / decrease in fund management costs:

Over time, the discontinuation of embedded commissions should curtail the incentive for mutual fund dealers and their representatives to recommend products that give priority to maximizing revenue over the interests of clients. Mutual fund dealers and their representatives are therefore likely to focus more on fund performance and fund fee levels, which in turn will put pressure on investment fund managers to improve their performance and reduce their fees. Investment fund managers with affiliated mutual fund dealers are also likely to be affected by this pricing and performance pressure over time.

The potential entrance of lower-cost product providers will likely increase the competitive pressure to decrease fund management costs even further (if not also distribution costs)[85] over time. We anticipate that the impact of new entrants into the mutual fund market will lead to a decline in the cost of existing funds as incumbent investment fund managers may adjust their pricing to retain market share. Based on the estimates provided above for low-cost provider pricing, we may see an MER decline of 25 to 50 bps for actively managed equity funds and 10 to 25 bps for actively managed fixed income funds shortly after the discontinuation of embedded commissions.[86]

---

[85] See for example, Victor Reklaitis, "The Vanguard effect on fund fees, in one handy table", *Market Watch*, November 16, 2015, http://www.marketwatch.com/story/the-vanguard-effect-on-fund-feeds-in-one-handy-table-2015-11-13.

[86] This estimate is based on incumbent investment fund managers reducing their existing fees by one third to two thirds of the difference between their fees and those charged by new low-cost market entrants. Note, as well, that we saw similar price declines after the entrance of low-cost ETF providers into the Canadian market in 2011 and in reaction to competition from U.S. domiciled ETFs which were going through their own pricing war at about the same time. Unlike the mutual fund market, the ETF market in Canada is open to competition from abroad. Canadians routinely purchase U.S. domiciled ETFs. At March 2016, 27 cents of every retail dollar invested in ETFs in Canada was held in a U.S. domiciled ETF.

iv. Shift in product recommendations to lower-cost / passively managed products:

It is reasonable to assume that the transition away from embedded commissions, coupled with the growth of lower-cost passively managed fund products, will also likely drive a shift to lower-cost passively managed funds in terms of the (i) product shelf chosen by dealers, (ii) recommendations made by representatives, and (iii) funds chosen by mutual fund investors over time. However, we are cautious regarding the extent and pace at which this shift would likely occur. As noted earlier and in Appendix A**,** the Canadian mutual fund market (excluding ETFs) is overwhelmingly focused on actively managed funds.[87] While the level of trailing commissions paid historically on index funds relative to actively managed funds was likely a driver of their lack of popularity with fund dealers and representatives, we also acknowledge that it takes time for habits to change.[88] In addition, while there are several investment fund managers that have offered and continue to offer index funds, they have historically not always 'actively' marketed them.[89]

If we consider the experience in the U.K.,[90] they began to see a significant increase in both sales and assets held in index tracking funds several years before the RDR reforms were introduced in January 1, 2013. According to data from the Investment Association, shown in Figure 9 below, index tracking fund ("tracker funds") market share began to significantly increase after 2009.[91] Market share of index tracking funds increased from 6.3% to 12.4% and assets under management increased by 251% (£77 billion) between December 2009 and December 2015.

[87] While the mutual fund industry launches an average of about 200 funds a year, the most recent index fund launch was in 2013.

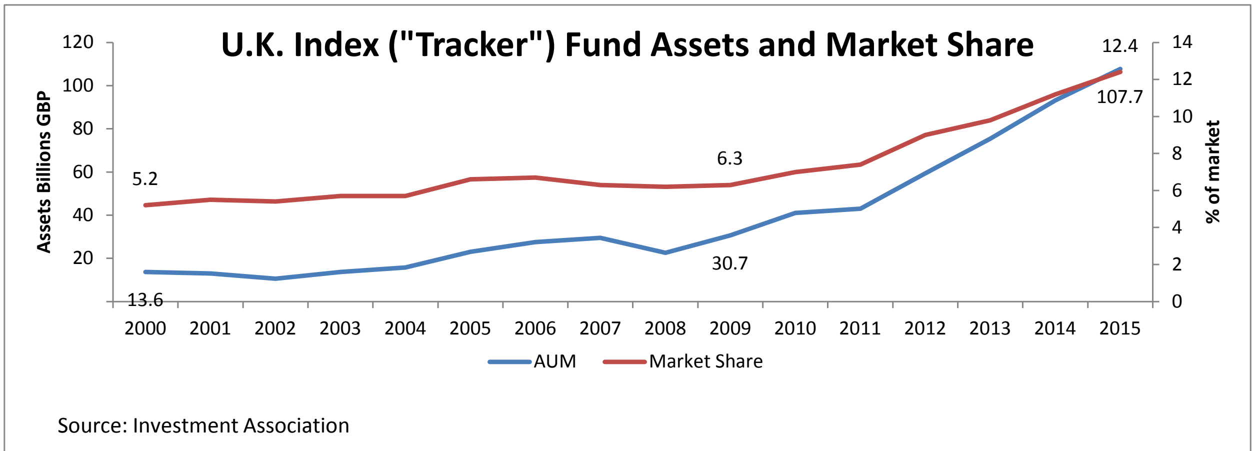
[88] Recent research highlighting the sub-optimality of the investment choices made by financial advisors for their portfolios suggests that established beliefs coupled with a lack of proficiency can be significant obstacles to change (See Juhani T. Linnainmaa, Brian T. Melzer, and Allessandro Previtero, "Costly Financial Advice: Conflicts of Interest or Misguided Beliefs?", December 2015, http://faculty.chicagobooth.edu/juhani.linnainmaa/MisguidedBeliefs.pdf). It's not clear from this research however how much of this product bias might be driven by the dealer's decisions regarding the product shelf. We know that the majority of mutual fund dealers in Canada are either proprietary only or are proprietary focused.

[89] See for example, Rob Carrick, "TD's e-series funds: Easy to love, hard to buy", *Globe and Mail*, May 9, 2011; Dan Bartolotti, "More Fun With the TD e-Series Funds", *Money Sense Magazine Online*, September 23, 2010; Dan Bartolotti, "TD Responds to e-Series Concerns", *Money Sense Magazine Online,* August 20, 2010.

[90] As mentioned in Part 1, while the analysis of relevant reforms in other jurisdiction is informative and insightful, the unique features of those markets, including the characteristics of their respective market participants and the specific competitive dynamics within which they operate, their market structure, the savings habits of their local investors, as well as the extent of their respective reforms, the specific impacts from the reforms in those jurisdictions might not be the same for the Canadian market.

[91] While final rules and guidance for the U.K.'s RDR reforms were released in March 2010, they were announced well before this date which allowed the securities industry to adjust in anticipation of the change (see for example, David Ricketts, "Rapidly evolving online platforms face competition", *Financial Times,* September 7, 2008).

Figure 9: Growth of Tracker Funds in the United Kingdom



If we were to see a similar increase in the run up to the discontinuation of embedded commissions in Canada, we would expect index fund market share to increase from their current share of 1.5% of market today ($18.8 billion[92]) to between 5% and 10% of market five years after the transition away from embedded commissions.[93]

v. Shift in assets across existing investment fund managers:

A shift toward lower-cost and passively managed funds stemming from the discontinuation of embedded commissions[94] would also likely occur between funds managed by the same investment fund manager. We may also see a shift of assets between conventional mutual funds and ETFs (whether managed by the same investment fund manager or not). In such cases, we would expect that all investment fund managers would be reviewing their fund offerings with respect to cost and performance and, in some cases, introducing or expanding their passively managed fund offerings.

Beyond the shift to passively managed products, we would also expect a potential shift in assets across active investment fund managers. For example, if active investment fund managers will need to compete more on the level of their risk adjusted performance after the discontinuation of

[92] See Figure 4 above (source: Investor Economics).

[93] This estimate is dependent on both how fast index fund demand increases after the discontinuation of trailing commissions and how strong aggregate growth is in the fund industry (among other factors). For example, if growth in the mutual fund industry over the last 10 years of around 7% were to persist, we were to see similar growth rates for index funds in Canada as we have seen in the U.K., and we were to eliminate embedded commissions in 2020, this would suggest total assets invested in index funds would grow from $18.8 billion today to $125 billion by 2025 – a 5% market share. If aggregate fund industry growth was to substantially slow (to 1 to 2% per year) and index fund growth was to remain the same, then index fund market share would move closer to the 10% mark.

[94] Besides the discontinuing of embedded commissions, many other factors could result in a shift in allocation of capital to lower-cost and passively managed funds.

embedded commissions than they do presently, it is reasonable to assume that actively managed funds producing negative alphas today could be considered at risk over time.

Based on a review of current actively managed fee-based (series F) fund offerings[95] and their five year alphas, the data suggests that:

- 87% of investment fund managers offering actively managed funds today have some funds with negative alphas which could be at risk of redemption if embedded commissions were discontinued and these managers were not able to adjust their fees or improve performance;[96]

- For active investment fund managers that manage funds with negative alphas, the proportion of assets at risk or redemption could be on average 53% of firm assets;

- In aggregate, an estimated 44% of actively managed fund assets may experience redemption and reallocation pressure to competitor investment fund managers over time if embedded commissions were discontinued and these managers were not able to adjust their fees or improve performance; and

- For active investment fund managers with little or no access to related party distribution[97], on average 59% of assets at these firms may experience redemption pressure over time assuming once again these managers were not able to adjust their fees or improve performance.

As we have emphasized throughout this section, much depends on how investment fund managers react to the discontinuation of embedded commissions. And as noted earlier, we expect investment fund managers to alter the way that they compete over time by reducing prices and refocusing their distribution efforts toward improvements in risk adjusted performance to retain market share.

---

[95] Since we are looking at what would happen after the discontinuation of embedded commissions, we have focused on 5 year alpha based on fee-based pricing. All analysis in this section is based on data from Morningstar Direct at June 2016.

[96] These assets may already be at risk today. However with the discontinuation of embedded commissions we would expect this risk to increase further. For funds that are already in net redemptions, their redemption rate may increase further.

[97] We focus here on those investment fund managers without significant access to captive distribution because Canadian and other international research has shown that affiliation (i.e. access to affiliated distribution) can be an effective barrier to price and performance competition (see for example, Douglas Cumming et al., supra note 3). However, we note in the next section that even for fund managers with access to captive distribution we anticipate that there could be significant product price and performance pressure after the removal of embedded commissions.

vi. Market innovations in product distribution and advice:

When considering the overall effects on product distribution and advice, it is important to note that the discontinuation of embedded commissions would not require dealers to move to a fee-based arrangement. As discussed in Part 3, dealers could still charge commissions to clients directly, move to a fee-based arrangement, move to an hourly rate, or move to any other combination of payments as long as compensation is not embedded within the product or paid by the investment fund manager.[98]

It is anticipated that if we were to discontinue embedded commissions, existing and new market innovations would help ensure that mass-market households still have access to advice.

As we highlighted earlier, the majority of mass-market households do not own investment funds and would not be affected by the discontinuation of embedded commissions. However, based on current market developments, they are likely to have more access to online advice over the next few years.[99]

Online advice (typically referred to as robo-advice) is still an emerging sector within Canadian financial services, though there are a number of online advice platforms that have been established for some time. While online advisers[100] have yet to make a large impact, either in the number of households serviced or in the share of wealth held by these firms, considering that online advisers typically offer investment fund products under an asset allocation service, there are a number of reasons why we should anticipate that they will be disruptive to the status quo and could have the potential to increase access to advice over time.

First, online advice is often less expensive than traditional advice channels and would likely remain so particularly if we were to discontinue embedded commissions.

---

[98] For example, in its latest data bulletin, the FCA reports that a number of charging structures are popular post-RDR including charging based on hourly rates (20% of firms), percentage of assets (48% of firms), fixed fees (22% of firms) and combined structures (10% of firms). Note that, unlike our current proposal, new front end commission arrangements were prohibited in the U.K. (Financial Conduct Authority, *Data Bulletin Issue 7*, October 2016).

[99] The result of a survey published by Ernst & Young in 2016 show that, in Canada, 8.2% of digitally active consumers have used at least two digital/online (**FinTech**) products within the last six months, in the form of money transfers and payments, and savings and investments, in comparison to 15.5% globally. The survey also shows that, if awareness of the available FinTech products by consumers increases, adoption rates could triple within a year from 8.2% to 24.1%.

[100] We refer to “online advisers” because in the Canadian market, advisers that provide advice using an online platform must be registered portfolio managers and restricted portfolio managers. These firms provide discretionary investment management services at a low cost to retail investors through an interactive website. Online advisers still have to review the accounts created through the automated process as outlined in CSA Staff Notice 31-342 *Guidelines for Portfolio Managers Regarding Online Advice*. The online advisers that have been approved to carry on business in Canada are not "robo-advisers" of the kind that are operating in the United States, which may provide their services to clients with little or no involvement of a representative of the adviser. By comparison, Canadian online advisers can be seen as providing hybrid services, in that they use an online platform for the efficiencies it offers, while their representatives remain actively involved in (and responsible for) decision-making.

The cost of distribution and advice when dealing with a traditional mutual fund dealer from a vertically integrated firm, not including any account fees or product costs, is typically 1% of assets or more.[101] Account pricing for online advice, net of mutual fund product costs, is typically between 0.15% and 0.7% of assets per year depending on the amount invested,[102]and the average fund MER on these platforms is approximately 0.25%. This ability of online advisers to undercut the costs of the dominant advice delivery channel for investment fund owning households with modest levels of accumulated wealth is likely to limit what this channel can charge going forward for investment fund distribution and advice.

In Figure 10 below, we show what the minimum, maximum and average online adviser costs in dollars are today for account assets up to $1 million. Against the traditional 1% mutual fund distribution cost model, it seems that online advice has the potential to become an important distribution model in Canada.

However, as we said at the outset, online advice is an emerging sector in Canada. Early pricing and services provided may not be indicative of pricing over the long term. For example, it remains to be seen whether these new online adviser entrants can gain enough scale before incumbents adopt innovation.[103] If these new entrants do not gain sufficient scale, the current pricing pressures that their entrance has brought about may be transitory. In addition, we have yet to see the entrance of low-cost, hybrid, online advice models in Canada as we have seen in other markets.[104]

If we were to discontinue embedded commissions, the ability of incumbents to limit this pricing pressure could be curtailed by the actions of more established and better capitalized entrants into the market post the discontinuation of trailing commissions.

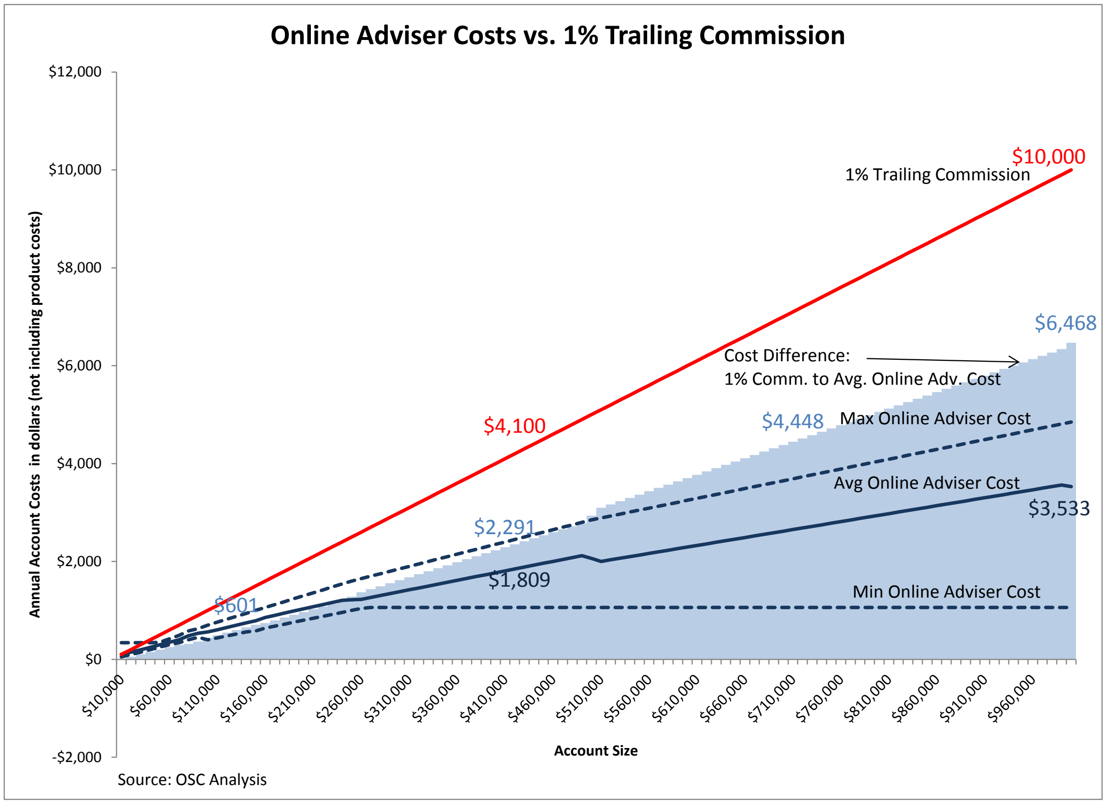
[101] The majority of mutual funds sold through bank branches are fund-of-funds (see for example, Investor Economics, *Insight Report*, November 2016, page 3). These funds typically include a posted trailing commission of 1% and in some cases more than 1%.

[102] We note however that not all online advice costs are this low today.

[103] We have seen some evidence of this already with BMO and RBC either moving or getting ready to move into online advice and Power Financial providing a large investment into Wealth Simple. See, for example: Fiona Collie, "RBC Wealth Management explores adding robo-advisor", *Investment Executive*, October 8, 2015; Paul Lucas, "Royal Bank of Canada turns to robo advisors", *Wealth Professional*, February 4, 2016. Several online advisers have also expanded to provide financial advisors a web-based platform that will allow them to keep offering services to non-core clients (i.e. mass-market households).

[104] See for example, the Vanguard Personal Advice Service offered in the United States, which offers clients with a minimum of $50,000 to invest automated advice coupled with access to a traditional advisor for an advice cost of 30 bps which decreases as assets rise (https://personal.vanguard.com/pdf/vpabroc.pdf). The program has been more successful relative to other automated advice only offerings. Assets in the program totaled $41 billion, one year after launch (see Alex Eule, "The Future of Mutual Funds", *Barron's*, July 9, 2016.).

Figure 10: Online adviser versus traditional advice costs



While online advisers are likely to have an impact on the price of distribution, they also may have an impact on the types of products distributed, particularly if embedded commissions are discontinued.

Once again, the majority of households with modest levels of accumulated savings have a relationship with a deposit-taker or insurer owned dealer. As previously discussed, the scale of the advice these households require may tend to be more limited and the types of products they are being offered are often packaged solutions such as fund-of-funds – because they are easy to sell and reduce the representative's compliance risk as they transfer the representative's portfolio creation role to the investment fund manager. In many ways, fund-of-funds are the equivalent of the asset allocation service offered by many online advisers. According to data from IFIC, for the six years ending December 2015, fund-of-fund net sales totaled $191 billion versus $32 billion for traditional stand-alone funds. They have become the dominant product in the mutual fund industry.

Fund-of-funds offered through the deposit-taker channel are typically invested in related party actively managed funds. Research suggests that while actively managed funds tend not to outperform their benchmarks, a portfolio of actively managed funds is even less likely to outperform a portfolio of passively managed funds.[105]

[105] Richard A. Ferri and Alex C. Benke, "A Case for Index Fund Portfolios: Investors holding only index funds have a better chance for success", June 2013. See additional research at Appendix A, note 194.

This trend is borne out by the performance of fund-of-funds in Canada. At the end of March 2016, and not accounting for survivorship bias,[106]which would reduce the percentage of outperformers further, only 8% of fund-of-fund products were able to beat their indices on a risk-adjusted basis[107] over 3 years, only 10% over 5 years, and only 8% over 10 years. Notably, only 3 funds were able to do it over all three periods.

As most fund-of-funds tend to be actively managed while many (but not all) portfolios managed by online advisers tend to be made up of lower-cost passively managed ETFs or mutual funds, we should expect that these portfolios will do at least as well as traditional fund-of-funds offered by vertically integrated firms today. Moreover, we should expect that the sophistication of online advice offerings will improve over time.

The fact that the advice is more automated means that, with the same number of representatives, online advice platforms have the potential to service more households relative to traditional advice channels. Furthermore, given that online advice tends to be less expensive and that it encompasses at least part of the benefits thought to be the potential drivers of value with traditional advice[108], we anticipate that its growth could potentially increase investors' access to advice in the future.[109]

Increased automation is also expected to benefit the traditional advice channel such that we should expect productivity gains here too. Automation may make it possible for the traditional advice channel to service parts of the market previously not covered.[110]

The discontinuation of embedded commissions, along with any potential enhancements to the obligations of dealers and representatives and the growth of online advisory services, may also drive up the demand and the supply of discretionary management[111] in Canada. This change is

---

[106] Not accounting for funds that have closed or merged over the period. Including these funds would have reduced the percentage of outperforming funds even further.

[107] As measured by information ratios over the time periods cited.

[108] From the Vanguard Advisor Alpha report – the drivers of value that would be incorporated into online advice options would be asset allocation, usage of low-cost products and rebalancing. Ryan Rich, Colleen M. Jaconetti, Francis M. Kinnery Jr., Donald G. Bennyhoff, and Yan Zilbering, "Putting a value on your value: Quantifying Vanguard Advisor's Alpha in Canada", 2015, The Vanguard Group, Inc.

[109] Accenture notes that "much of the initial uptake and interest in robo-advice is coming from the "mass-affluent, delegator" market segment, which has traditionally been underserved". See Accenture "The Rise of Robo-Advice: Changing the Concept of Wealth Management," 2015, page 2.

[110] See for example: Tessie Sanci, "Nest Wealth readies launch of new tool for financial advisors", *Investment Executive*, April 19, 2016; James Langton, "Canada's robo-advisor market to see robust growth", *Investment Executive*, May 19, 2016; Tessie Sanci, "Wealthsimple for Advisors readies for launch", *Investment Executive*, May 11, 2016.

[111] Discretionary management means a form of investment management in which a portfolio manager has the authority to make investment decisions for a client's account, including the discretion to trade in securities for the

expected because these initiatives, along with the CRM2 initiative, may encourage dealers and their representatives to explain their value proposition to clients in a way many have never had to. In some cases, the easiest way for the representative to do this will be to show the client that the use of discretionary advice creates a savings discipline, simplifies their life and frees up their time. There is some evidence that this shift has occurred in the U.K. post-RDR and across Europe generally where similar changes have been introduced.[112] There is also an expectation that use of discretionary advice will continue to grow in these markets for the foreseeable future.

It is important to note that this trend, were it to occur either in response to the discontinuation of embedded commissions or other ongoing policy initiatives, would be likely to drive up the cost of advice. However we should also expect, in such a scenario, that the level of service and advice would be potentially more aligned with the costs paid.

Whether or not this shift is a benefit to investors depends on whether investors or dealer firms are driving the change. For example, European and U.K. firms surveyed have suggested that they have moved or are expecting to move more toward discretionary advice at least in part because they consider it is a less-time intensive (and thus more profitable) model to run from a compliance cost perspective relative to traditional advisory services.[113] Others surveyed have argued that, while this model is simpler and more scalable, what is equally driving the change is the fact that this model is also easier for clients to understand and thus more valuable to them.[114]

We anticipate that some dealers would be less impacted by the discontinuation of embedded commissions than others, at least initially. Those dealers, typically deposit-taker and insurer owned mutual fund dealers, that do not receive embedded commissions today but instead receive transfer payments unrelated to an investor's purchase or continued ownership of a mutual fund security from their non-securities registered parent firm, may be less affected by the discontinuation of embedded commissions. It is anticipated that even these firms would be encouraged to make changes over time to their products and services and their pricing in order to compete with new low-cost distribution models.[115]

We focus in the next section on the potential impact to specific stakeholders.

---

account without requiring the client's express consent to a transaction (ref.: definition of "managed account" in National Instrument 31-103 – *Registration Requirements, Exemptions and Ongoing Registrant Obligations*).

[112] See for example: Joint report of Oliver Wyman and J.P. Morgan, "The Future of European Wealth Management: Imperatives for Success", November 2014; BlackRock, "Wealth Management Industry Survey 2015"; David Boyle, "A strong DFM market", *Defaqto*, March 26, 2016; "DFMs open up a greater choice for clients", *FT Adviser*, October 24, 2016.

[113] Joint report of Oliver Wyman and J.P. Morgan, "The Future of European Wealth Management: Imperatives for Success", November 2014, page 15.

[114] BlackRock, "Wealth Management Industry Survey 2015".

[115] It is worth noting that some firms have anticipated these changes and have already begun to simplify their purchase options, lower product costs, and introduce direct pay arrangements within their branch network (see note 80).

3. ***Impact of the discontinuation of embedded commissions on specific stakeholders***

a. Investors

We set out below the potential impact of the discontinuation of embedded commissions on different investor segments. The impact we have outlined for one segment of investors could also apply to a certain degree to another segment of investors.

i. Investors with investable assets below $100k (mass-market)

As explained above, we anticipate that, like all fund investors, this group of investors would likely see the cost of active management and fund management generally decline. New players entering the market would likely service these investors and their usage of low-cost, passively managed funds would likely increase. In order to service these investors, dealers will likely be encouraged to increase or introduce the use of simplified online advice options. An implication of this development, coupled with the discussion earlier about the number of households in this group that do not own investment funds today, is that the size of this group has the potential to grow over time. Fund ownership has the potential to move beyond 37% of all Canadian households today.

Considering the shift in product recommendations discussed previously, we anticipate that representatives, particularly at independent mutual fund dealers which offer an open product shelf, would focus more on lowering product costs and choosing better performing products over time. The discontinuation of embedded commissions would also eliminate the incentive for representatives to potentially engage in unsuitable leverage strategies. A potential negative impact of the discontinuation of embedded commissions for mass-market households is that some independent fund dealers may choose not to continue to service these households.[116]

Some investors, when presented with the cost of advice may not see value in it and choose to move to another dealer, to an online/discount broker or to an online adviser. We do question though the extent to which this change will occur given that the implementation of the new CRM2 annual report on charges and other compensation will have been completed. It is possible that investors that do not see value from advice, in reaction to the CRM2 disclosures, may have already moved their assets to another dealer, to an online/discount broker or to an online adviser. Where we may see movement is for those investors who want to use mutual funds but do not want to use advice. For investors that move their assets to an online/discount broker, they will no longer bear the cost of full trailing commissions if they make the switch.

It is fair to say that this group of investors is the group most at risk of falling into the "advice gap" – the group of investors who cannot obtain the amount of advice they desire at the price they are willing to pay – today.[117] As was outlined earlier, this is also the group of fund investors

---

[116] We note that based on the Ipsos data, an estimated 14% of mass-market households work with an independent/other integrated fund dealer today. About 38% of these households also have a relationship with a deposit-taker or insurer owned dealer.

[117] In the FCA and HM Treasury's *Financial Advice Market Review: Final Report (*March 2016), "advice gap" is similarly defined as situations in which consumers are unable to get advice and guidance on a need they have at a

that are least likely to be receiving advice today and when they do receive advice, the range of services[118] provided tends to be less than for those with higher levels of wealth.[119] Households with little to invest are considered to be the most difficult for the industry to service today given the costs and scalability of existing advice models versus the potential revenue gained. Admittedly, in terms of the number (though not in terms of the share of total wealth) this group makes up the largest share of households.

For a number of reasons alluded to earlier in this section, despite the potential risks, we do not anticipate a significant advice gap in the event that we move forward with our proposals.

First, with respect to the risk of increasing the "advice gap", we note that the majority of mass-market households do not own investment funds and that for the mass-market households that do own investment funds, the majority have tended to purchase them through a deposit-taker or insurer owned dealer. We anticipate that deposit-taker and insurer owned dealers will continue to serve mass-market households if we transition away from embedded commissions. As noted earlier, by virtue of being both vertically and horizontally integrated, many deposit-taker and insurer owned dealers (particularly in the mutual fund dealer channel where we have shown the majority of these households are serviced) have already moved away from traditional grid based compensation that relies on embedded commissions.[120] Their high level of horizontal integration has led these firms to focus less on any one business line (e.g. mutual funds, GICs, mortgages, credit cards etc.) and focus more on gathering assets across all business lines and on directing clients to the appropriate business line.[121]

The discontinuation of embedded commissions by itself will likely have little direct impact on these integrated business models. They will continue to provide a wide array of financial products and services (including mutual funds) to households with little to invest. We have already outlined trends with respect to automation that may actually increase access to advice for

---

price they are willing to pay. Based on the experience in other jurisdictions, we note that an advice gap is not a phenomenon that occurs only because of a ban on embedded commissions, but rather it is a function of a number of factors (changes to existing business models, changes to consumer preferences, technological changes etc.) that occur normally in any competitive market for financial services.

[118] Financial services and advice can, but need not always, encompass a broad range of services such as investment recommendations, asset allocation, the setup of systematic savings plans and/or registered plans, the preparation of a written financial plan, tax planning, estate planning, debt management, budgeting cash flows, etc.

[119] As noted earlier when looking at the Ipsos household survey data, the usage and, likely, the breadth of advice tend to increase with household wealth.

[120] For example, see the discussion in MFDA Bulletin #0689-P, supra note 24, regarding the cost disclosure requirements for dealers that do not receive commissions but instead receive transfer payments from affiliates based upon a management agreement with the corporate parent. Also see previous research completed by CSA staff into advisor compensation practices.

[121] For example, to their related branch direct, branch advice, financial advisor, full-service dealer or private wealth management arm.

this group[122] and we have noted the much higher levels of advice coverage and advisor availability in Canada versus other jurisdictions such as the U.K.

With respect to the developments in the advice market in the U.K. post-RDR, it is important to take note of the other factors that have led to the advice gap that are not present in the Canadian context.

In the recent financial advice market review conducted by the Financial Conduct Authority (**FCA**) and HM Treasury in the U.K.[123], they identify that the standards and professionalism in the industry have increased. As well, the move to a direct pay model for advice on retail investment products has improved transparency and significantly reduced certain conflicts of interest. However, they also identified a number of obstacles post-RDR implementation that are limiting accessibility and affordability of advice, including:

- a need for clarity as to when general forms of advice become or are considered "regulated advice" [124];
- a need for clarity on responsibilities when providing guidance that is not "regulated advice" (e.g. online calculators and tools, providing general behavioural nudges to clients);
- a need for clarity on how to tailor suitability assessments when providing narrow forms of advice;
- extending the time new employees can work under supervision while obtaining qualifications in order to provide more flexibility to train a new generation of advisers;
- clarifying the length of time a firm can cross-subsidize the cost of new advice delivery models while still ensuring that over the long-term the charges for their advice service cover the costs of providing that service **(the cross-subsidization rule);** and
- assistance in introducing new technologies to automate advice and to streamline and codify the fact finding process used in traditional advice in order to reduce the cost of suitability assessments.

None of these obstacles limiting access and affordability were found to be related to the removal of embedded commissions but rather they tended to be tied to the particular way in which the FCA chose to raise the standard of care.

The new standard for advisors implemented in the U.K. with RDR has much wider scope, in terms of the types of advice covered and the limitations on business conduct, than is

---

[122] See also Accenture, "2016 North American Consumer Digital Banking Survey, Banking on Value: Rewards, Robo-Advice and Relevance," 2016.

[123] Financial Conduct Authority, HM Treasury, *Financial Advice Market Review: Final report*, March 2016.

[124] Advice relating to a particular investment given to a person in their capacity as an investor or potential investor (or their agent) and relates to the merits of them buying, selling, subscribing for, or underwriting (or exercising rights to acquire, dispose of, or underwrite) the investment. See Financial Conduct Authority, *Finalised Guidance FG15/1: Retail investment advice: Clarifying the boundaries and exploring the barriers to market development*, January 2015 (http://www.fca.org.uk/static/documents/finalised-guidance/fg15-01.pdf).

contemplated in CSA CP 33-404. For example, the CSA has not contemplated an equivalent to the FCA's cross-subsidization rule which seems to have played a role in limiting the introduction of new advice delivery models in the U.K. Therefore, we do not anticipate the same obstacles to the development of new lower-cost distribution models in Canada after the discontinuation of embedded commissions.

In addition, as discussed later in Part 5, if the CSA were to discontinue embedded commissions, the CSA would aim for a transition period sufficient to allow market participants time to adjust their business models with the objective of mitigating any investor harm. Finally, as has been the case with the introduction of CRM2 and POS, we anticipate that the industry will find it in its interest to educate and prepare their clients for such a change in order to minimize disruption to its business.[125]

It is possible, however, that the cost of *traditional* advice may rise for this group. 'Bricks and mortar' advice is also likely to decline for this group (although this change may occur anyway for this group over the next few years as account minimums to access advice may continue to increase).

As mentioned in Part 5, the transition to direct pay arrangements and the implementation of other regulatory reforms may lead to an increase in the cost of dealers' operations and compliance, which may lead to an increase in the cost of advice. Some investors may be pushed into online advice relationships, other more simplified forms of advice, or the online/discount brokerage channel even though these services may not meet all their needs and even though they may prefer, but can no longer afford, face-to-face advice.[126]

We do not anticipate that there would be a significant change in the fund products recommended through integrated mutual fund dealer firms although, as we have noted, the cost and performance of those products may change in reaction to new market entrants. There is also the possibility that some representatives may have less of an incentive to service clients after the initial sale were we to move to more widespread use of fee-based arrangements. This may lead to reverse churning.[127]

---

[125] James Langton, "MFDA, IFIC help inform investors about pre-sale disclosure", *Investment Executive*, February 25, 2016; Rosemary McCracken, "Talk with your clients about compensation before CRM2 comes into effect", *Insurance & Investment Journal*, November 20, 2015.

[126] We note however that recently released data on the cost of fee-based – percentage of asset fee – charges in the U.K. post-RDR suggest the fees are not too different from the fees charged today in Canada. Initial fees of 1% to 3% with annual ongoing fees of 0.5% to 1% of assets (see Financial Conduct Authority, *Data Bulletin Issue 7,* October 2016, page 11).

[127] Churning typically occurs when a dealer engages in excessive buying and selling of securities in a customer's account chiefly to generate commissions that benefit the dealer. In contrast, "reverse churning" occurs when a dealer places a customer's assets in a fee-based account (or receives some form of asset based compensation) chiefly to collect the fee then subsequently does little for the client, in terms of actual advice, trading or account activity, in exchange for that fee.

As the investor may not be equipped to negotiate the fees or may not fully appreciate that there is a cost to distribution, moving to a fee-for-service model could have the consequence of discouraging some investors from seeking financial advice, particularly where they are indirectly paying for but are not receiving advice (outside of the required suitability assessment) today, as they may be unwilling to pay a fee for such advice.[128] Finally, where representatives choose to offer their services to clients under a transaction-based commission arrangement, they may be incented to churn the account.[129]

ii. Investors with investable assets between $100k and $500k (mid-market)

Similar to investors with modest levels of accumulated wealth, we would expect this group to benefit from lower fund management costs, whether funds are actively or passively managed. We also expect that new players entering the market would tend to target this group and their usage of passively managed funds would likely increase. A transition away from embedded commissions will likely drive a shift in products recommended by representatives and made available on the dealer product shelf toward lower-cost and passively managed funds, which could improve investor outcomes. We expect client engagement with this segment of investors to increase with respect to the services and advice options offered (e.g. full, partial, à la carte options). These different types of service and advice options are likely to give investors more control and more clarity over the advisor/client relationship. This group is also likely to be offered more discretionary advice over time.

Similar to the push toward online advisory services for investors with less than $100,000 to invest, it is possible that some "buy-and-hold" investors may be moved into fee-based accounts when transaction-based fees may be better for their circumstances (we note that this shift is already occurring today). We anticipate that the concept proposals outlined in CSA CP 33-404, if implemented, would limit this potential impact. As outlined above, there is also the potential for reverse churning in these arrangements.

iii. Investors with investable assets above $500k (affluent)

We anticipate that this group of investors will be the least impacted by the discontinuation of embedded commissions as they are the most likely to be using non-embedded forms of dealer compensation today. They would, however, likely benefit from the fund management cost declines outlined above. As with the other two investor groups, representatives at private wealth management firms and representatives at IIROC dealers would likely focus more on recommending lower-cost and passively managed funds to their affluent clients where it is appropriate to do so. Usage of discretionary advice is likely to go up substantially for this group. We anticipate similar potential negative impacts as those anticipated for the other two investor groups. Given that the affluent group of investors is the most sought after by advisors today, we

[128] A recent article questions how much advice is provided to the typical advised client given the number of clients typically serviced by the average advisor (see Dan Hallett, "Advice gap exists now," Investment Executive, Mid-November 2016.

[129] Although churning is something that can typically be detected easily and that self-regulating organizations (**SRO**) and compliance officers routinely check for.

anticipate that they will continue to be provided the most flexibility in terms of payment arrangements and the most number and scope of advice delivery and service offerings.

iv. Do it yourself investors

For DIY investors, the discontinuation of trailing commissions would significantly lower costs as we would expect them to benefit from the decline in fund management costs and the removal of the full trailing commission costs they often pay today. The supply of DIY fund series options may also increase from 493 today to 4,901 options (based on a comparison of the D series and F series available today). These investors will, however, be required to pay transaction-based or asset-based fees directly, to offset the revenue lost from trailing commissions. We do not expect these payments to be any higher than the trailing commissions paid on DIY fund series today – typically 0.25% - which would represent a 75 bps decline from what they would typically pay today.

b. Dealers and investment fund managers

Based on the facts outlined in the previous sections of Part 4, we anticipate that, if we were to discontinue embedded commissions, all industry stakeholders would take the necessary steps to adapt to direct pay arrangements by innovating, segmenting their products and services, and using new technologies, to the extent possible within firm specific resource constraints.

i. Independent investment fund managers

As outlined previously, we expect fund management costs to decline and the share of lower-cost funds and passively managed funds sold in Canada to increase over time. Given that total mutual fund assets have been growing at an average 7.2% per year over the last ten years, we anticipate that a potential increase in the sale of passively managed funds would not necessarily involve a decline in the sale of actively managed funds in Canada nor a decline in the total dollars invested in actively managed funds.

We also estimate that, based on current five year fund alphas, there would be some proportion of actively managed fund assets likely at risk of experiencing redemption pressure. For relatively higher cost active investment fund managers with a large proportion of negative alpha funds and no access to affiliated dealer distribution today, there would likely be more challenges in the event that there is a discontinuation of embedded commissions. These investment fund managers could potentially have fewer options to cross-subsidize across business lines relative to their integrated investment fund manager peers.

We do anticipate, however, that the remaining active investment fund managers are more likely to be high alpha producing firms. For those active investment fund managers that do not pay trailing commissions or pay relatively lower trailing commissions today, it is reasonable to assume that they will have better access to the discount brokerage channel than they do today.[130] The discontinuation of embedded commissions could also provide high alpha generating independent investment fund managers with a better opportunity to access the IIROC channel

[130] Gail Bebee, "Choosing a discount broker", *Morningstar Canada*, April 15, 2014

and the independent MFDA channel than is the case today as we anticipate that fund performance would become a more important driver of fund flows resulting in a shift in market share towards these managers.

While we anticipate increased access to lower-cost fund products in the IIROC and independent MFDA platforms, we also anticipate that independent investment fund managers will still be at a disadvantage as they may not be able to gain access to those firms with closed, proprietary only, product shelves (predominantly deposit-taker and insurer owned MFDA firms). As an alternative, these investment fund managers may be required to set up a direct to client channel and obtain a dealer registration in order to compete in this space or alternatively, access these investors via a third party online advisory service.

ii. Independent mutual fund dealers

We anticipate that independent mutual fund dealers, similar to the situation for investment fund managers, would be required to compete more on their overall level of services and advice in a market that is likely to be transformed significantly by automated solutions and technological change generally over the next few years. Despite the increase in competition, there may be opportunities that arise for these firms as well.

The introduction of more low-cost fund products is likely to allow independent dealers, at least initially, to put pressure on their integrated fund dealer competitors. Representatives at independent firms will be further encouraged to study the product market on behalf of their clients with price and performance in mind which may result in better recommendations and better outcomes for their clients over time. Representatives are also likely to have access to more tools that will allow them to service a wider range of clients than is the case today.[131] It is possible that, similar to the case for independent investment fund managers, these firms could have fewer cross-subsidization options relative to their integrated fund dealer peers.

We anticipate that some independent dealers, if they cannot explain their value proposition, may have trouble maintaining their assets under administration. However, this may already become a trend to a certain degree with the introduction of the annual report on charges and other compensation (CRM2), whether or not embedded commissions are discontinued. Client engagement for the remaining firms will increase as will the service options that can be offered to clients.

There is also a risk that some dealers and representatives that can recommend non-securities products may prioritize their compensation interests over the interests of their clients by

[131] Some established online advisory firms are now offering advisor access to their platforms to help financial advisors better serve small retail investors and reduce the administrative burden related to the administration of smaller accounts. See for example, Tessi Sanci, “Wealthsimple for Advisors readies for launch”, *Investment Executive*, May 11, 2016 (http://www.investmentexecutive.com/-/wealthsimple-for-advisors-readies-for-launch) and Wealthsimple website (https://www.wealthsimple.com/advisors).

inappropriately shifting their clients' assets to non-securities investment products with embedded fees.[132]

All things being equal, following the discontinuation of embedded commissions, it is expected that dealers will compensate for the loss of revenue from embedded commissions with revenue from direct pay arrangements. It is possible that the discontinuation of embedded commissions may disadvantage small-to-medium sized independent mutual fund dealers relative to full-service IIROC dealers because they rely more heavily on embedded commissions than do IIROC dealers.

As at September 2014, trailing commissions represented approximately 27% of the fee revenue and mutual fund commissions represented 16% of annual commission revenue for full-service IIROC dealers.[133] We recognize that this change will represent an important shift in the business model of independent MFDA dealers and, were we to move forward, the method by which we would transition would be key to its success (as outlined in Part 5 of this Consultation Paper).

iii. Integrated financial service providers

We set out below the potential impacts specific to a dealer or an investment fund manager that is part of an integrated financial service provider. The impacts outlined above may also apply to them to a certain degree.

For the asset management arms of integrated financial service providers, we anticipate that new entrants to the market would put pressure on asset management pricing. Integrated investment fund managers would likely need to lower their asset management pricing to compete. They would also likely need to reassess their product pricing and would be encouraged to distribute their low-cost, passively managed fund options. It is important to note however that, given their access to their closed shelf related mutual fund dealer channel, these firms would likely not feel the same pricing and redemption pressure as their independent investment fund manager peers, at least initially.

For integrated dealers that choose to be open shelf, due to the potential introduction of the enhancement to KYP obligations as currently outlined in CSA CP 33-404, representatives may be required to study the market, including the use of non-proprietary funds, on behalf of their

[132] Such recommendations would however have to be in compliance with the requirements of the regime applicable to non-securities products. If an important shift to non-securities products were to happen, we would assume that the SROs and regulators of non-securities products (including some CSA members) would remain vigilant and take any necessary action in the case of non-compliance. Non-securities regulators are increasingly considering regulatory initiatives in order to ensure a harmonized approach with securities regulators on similar products. See Part 3. Also, with the introduction of POS and CRM2, we continue to monitor the potential for regulatory arbitrage. We note the data in Figure 5 above showing assets and growth rates of mutual funds versus other investment funds does not suggest that regulatory arbitrage is occurring today. This is also borne out when we look at net sales and sales rates for these products and advisor dual licensing.

[133] Investor Economics, *Retail Brokerage and Distribution Advisory Service*, Fall 2015 edition.

clients with price and performance in mind which could result in better recommendations and better outcomes over time.

For integrated dealers that choose to offer a closed shelf, as mentioned above, they would not feel the same level of pressure and would, at least initially, still be able to operate mostly as they do today, although as previously mentioned, the cost of the proprietary funds offered may fall. Furthermore, we would anticipate that both the discontinuation of embedded commissions and the potential KYP reforms proposed in CSA CP 33-404 would be unlikely to reverse, and may even increase, the trend toward retaining mid-market and affluent households within the branch network[134] (rather than referring them to their related party open shelf platforms or private wealth management arms). Integrated firms as a whole would have more options, at least initially, to cross subsidize across both securities and non-securities business lines to maintain market share.

Over time however, it is reasonable to assume that even these firms would feel pricing pressure in their closed shelf distribution channels which may incent these firms to embrace new technologies, adopt new pricing strategies and service offerings and rely less on traditional advice (many are already doing so). Furthermore, the potential entrance of low-cost hybrid online adviser models into Canada would likely put further pressure on the integrated fund distribution model.

Now that we have looked at the potential overall and specific market impacts of the discontinuation of embedded commissions, we discuss how this policy change may address our identified concerns.

4. ***How does the discontinuation of embedded commissions potentially address some of the CSA's concerns?***

Eliminating important inherent conflicts of interest

The discontinuation of embedded commissions would eliminate an important inherent conflict of interest that research has shown misaligns the interests of investment fund managers, dealers and representatives with those of investors. Our analysis leads us to believe that discontinuing embedded commissions would increase investment fund managers' focus on fund performance and discourage biased recommendations that may prioritize the maximization of compensation over the interest of the investor. The discontinuation of embedded commissions would also eliminate the incentive for representatives to potentially engage in unsuitable leverage strategies (as explained in Appendix A). The discontinuation of embedded commissions is the clearest and most direct way to address these conflicts of interest. In addition, when combined with certain concepts in CSA CP 33-404, if implemented, the representative-client compensation discussion is more likely to result in a compensation arrangement that is more appropriate for the client's situation.

[134] On the increase in the client wealth "ceiling" within the branch network see, Investor Economics, *Retail Brokerage Report*, Fall 2012, page 10.

The discontinuation of embedded commissions also complements the proposals outlined in CSA CP 33-404. Generally, jurisdictions that have enhanced the advisor's standards and obligations have eliminated embedded commissions at the same time (as outlined in Appendix C) because they have recognized that these payments are one of the main obstacles preventing the advisor from working in the interest of their clients. Research suggests that these payments are a conflict that is very difficult to manage or mitigate, except through avoidance. [135]

Addressing dealer affiliation biases

To a lesser extent, discontinuing embedded commissions may address some dealer affiliation biases directly through the IIROC channel where representatives are paid trailing commissions and indirectly through the mutual fund dealer channel where, despite the focus on proprietary products, asset management fees would need to fall in-line with the rest of the market in order to be competitive on total costs. We recognize that discontinuing embedded commissions does not address all dealer affiliation issues. However the proposals outlined in CSA CP 33-404, if implemented, in conjunction with this proposal may address some conflict issues with respect to internal compensation arrangements at the dealer.[136]

Reducing the number of mutual fund series and the fee complexity that these series create

The fund fee structure has grown increasingly complex due to the growing number of fund series on offer, with each series charging different fees (largely due to differences in dealer compensation). We anticipate that the discontinuation of embedded commissions would significantly simplify the fund fee structure in Canada, facilitate easier product cost and performance comparisons, and incrementally reduce information asymmetry for all market participants (in particular, for retail investors).[137]

Increasing the transparency of dealer compensation costs

We anticipate that eliminating embedded commissions would address fund fee and dealer compensation awareness concerns. Unlike disclosure, which only requires delivery and not understanding, the discontinuation of embedded commissions requires the representative to engage in an in-depth discussion with the client and obtain the client's agreement upfront in order to get paid.[138] More general compensation disclosure such as when a new product is being introduced to the portfolio (fund facts) or more specific compensation disclosure 12 months after engaging the representative (CRM2) serves many purposes and is important, but research

[135] Note that Part 6 of this Consultation paper also explores these issues in the context of why existing reforms may not go far enough.

[136] See CSA CP 33-404, Appendix A.

[137] See for example, Dan Hallett, "Be wary of unmentioned fees in ads for F-Series funds", *Globe and Mail*, May 30, 2016.

[138] The outset of the relationship is arguably when the investor has the highest level of bargaining power as a opposed to 12 months after the engagement of the advisor when they receive their cost disclosure statements and the investor may incur switch costs to make a change.

suggests that this may not be as effective as an upfront discussion and agreement regarding compensation.

Better alignment between the costs paid by investors for financial advice and the services provided to clients by dealers and representatives

The discontinuation of embedded commissions, replaced by an upfront discussion and agreement regarding compensation, also addresses the questions regarding what fees are being paid and more importantly, what they are being paid for. As we have seen already with high net worth client relationships, moving to a direct pay model may allow services and pricing to be more easily tailored to the client's needs.[139]

The discontinuation of embedded commissions would incent investment fund managers, dealers and representatives to be clear about, and to better demonstrate, their respective value propositions. It also allows DIY fund investors to forgo advice and the cost of advice.

In addition, after the discontinuation of embedded commissions, the representative-client compensation discussion is more likely to result in a compensation arrangement that is most appropriate for the client's situation. Transition to direct pay arrangements may also help to increase investors' control over dealer compensation costs and the services provided.

Encouraging new lower-cost fund providers to enter the market

The discontinuation of embedded commissions may encourage new low-cost fund providers to enter the market with a range of passive and actively managed funds. These new entrants will likely service retail investors in all wealth segments as they do today in other jurisdictions in which they compete.

Increasing price competition and decreasing fund management costs

It has been well-documented that one of the things new lower-cost entrants bring to the markets that they enter is significant competitive pressure on incumbents to decrease fund management costs over time.[140] We anticipate that their entrance will encourage the manufacturing and distribution of lower-cost funds. We would expect to see a shift in product recommendations to lower-cost and passively managed products, and a shift in the allocation of capital across active investment fund managers that will ultimately benefit investor outcomes.

---

[139] Advisors making the switch to fee-based and other direct pay arrangements today are routinely counselled to make sure that they understand and can communicate their value proposition to their clients before making the change. See for example, Ahmad Hathout, "Transition to fees requires support", *Investment Executive*, June 2016.

[140] See for example, "Index we trust", *The Economist*, June 11, 2016.

Questions

Where possible, we strongly encourage commenters to provide data to support responses.

Addressing the issues

12. Based on a consideration of the data and evidence provided in this Part, would a proposal to discontinue embedded commissions address the three key investor protection and market efficiency issues discussed in Part 2?

13. Are there other ways in which the CSA could address these issues that could be introduced in conjunction with, or separate from, the discontinuation of embedded commissions?

14. Are there other conflicts of interest that could emerge following a transition to direct pay arrangements that would not be addressed in the current securities regulation framework?

Change in investor experience and outcomes

15. What effect do you think the removal of embedded commissions will have on investor experience and outcomes? In particular:

    - Will investors receive advice and financial services that are more aligned with the fees they pay?
    - What effect will the proposal have on the growth of automated advice? Is this likely to be beneficial to investors?
    - Is discretionary advice likely to increase in Canada as we have seen in the other markets that have transitioned away from embedded commissions and, if so, would this shift be positive or negative for investors?
    - What effect will the proposal have on the growth of the online/discount brokerage channel and cost of fund products offered in this channel? Is this likely to be beneficial to investors?
    - What effect will the proposal have on the cost and scope of advice provided to specific investor segments?

16. What types of payment arrangements are likely to result if this proposal is adopted? In particular:

    - Would the payment arrangements offered by dealers to investors differ based on investor segment? If so, how and why?

17. Do you think this proposal will lead to an advice gap? In particular:

    - Which segments of the market are likely to be affected? Please consider segmentation by wealth, geography (size and location of community e.g. remote, small, medium, large), age, technological sophistication, the level of fund ownership across households, etc.

- Do you agree with our definition of an advice gap?
- Should we differentiate between an advice gap for face-to-face advice and an advice gap generally?
- What types of advice or services currently provided today would be most affected by the proposal?
- Are there any potential interactions between this proposal, existing reforms such as CRM2 and other potential reforms such as CSA CP 33-404 that may affect the size of any potential advice gap?
- How could a potential advice gap, face-to-face advice gap or financial service gap be mitigated?
- Do you think that online advice could mitigate an advice gap? If so, how?
- Do you think that the significant market share of deposit-taker owned and insurer-owned dealers in fund distribution in Canada will affect the size or likelihood of an advice gap to develop?

Industry change independent of regulatory response to discontinue embedded commissions

18. Given some of the changes we have seen in the industry over the past few years (fee reductions, introduction of DIY series, streamlining of fund series, automatic fee reductions increasing access to fee-based options etc.), what is the likelihood that the fund industry will transition away from embedded commissions without regulatory action? In particular:

    - Will the industry continue to transition away from embedded commissions if the CSA does not move forward with the proposal?

19. How accurate is Figure 8 regarding the purchase options available to fund investors by channel, account size and firm type? In particular:

    - Do you see payment options and business models evolving at present?
    - How are they likely to change over time if the CSA were to choose not to move forward with the proposal?

20. We note that the distribution of fee-based series is still relatively limited in Canada versus other markets. Are there obstacles (structural, operational, regulatory, investor demand, etc.) specific to Canada limiting the use of fee-based series by dealers?

Potential impact on competition and market structure

21. Please describe how discontinuing embedded commissions will affect competition and market structure and whether you agree with the analysis set out in Part 4? In particular:

    - Do you think the proposal will have an impact on the level of industry consolidation or integration? What about with respect to the concentration of mass-market investor assets held in investment products managed by deposit-taker owned firms?
    - What are the likely impacts on investor outcomes and market efficiency of any

potential consolidation?
- What opportunities and what challenges do you think the proposal would introduce for specific industry stakeholder groups?
  - Independent dealers?
  - Independent fund manufacturers?
  - Integrated financial service providers?
  - Mutual fund dealers?
  - IIROC dealers?
  - Online/discount brokers?
- What is the likelihood and magnitude of regulatory arbitrage across similar financial products such as segregated funds and deposit-taker products?
- What would be the impact on dually-licensed mutual fund dealers and insurance agents?
- Will the proposal lead new, lower-cost entrants to the market? Why and how?
- Does the interaction between this proposal and the proposals set out in CSA CP 33-404 change your responses to the questions above and, if so, how?
- Will a transition away from embedded commissions reduce fund series and fee complexity, as we have contemplated?
- Do integrated financial service providers have an advantage in terms of their ability to cross-sell and cross-subsidize across business lines? If so, how?
- What are the potential effects on competition of the rise in online advice? Are these effects likely to be large and positive?

22. What impact will the proposal have on back office service processes at the investment fund manager or at the fund dealer? In particular:

    - Is there any specific operational or technological impact that we should take into consideration?

23. The payment of embedded commissions requires the dealer and the investment fund manager to implement controls and oversight (with associated compliance costs) in order to mitigate the inherent conflicts of interest today.

    - Would the transition to direct pay arrangements alleviate the need for some of these controls and oversight?
    - To what extent, if any, does the use of direct pay arrangements by representatives today (e.g. when a representative provides services under a fee-based arrangement) alleviate the need for some of these controls and oversight?

24. Embedded commissions, especially trailing commissions, provide a steady source of revenue for dealers and their representatives. If embedded commissions were discontinued, would dealers be able to compensate for the loss of this revenue with direct pay arrangements?

25. Aside from commission grids and salaries, what other approaches to representative compensation might dealers use if we were to discontinue embedded commissions? How are these approaches likely to change over time?

26. What impact will the proposal have on representatives in the industry? In particular, what impact will the proposal have on the:
    - career path;
    - attractiveness of the job;
    - typical profile of individuals attracted to the career;
    - recruitment; and
    - relative attractiveness of careers in competing financial service business lines?

PART 5 – MITIGATION MEASURES

The CSA appreciate that a transition to direct pay arrangements would be a significant policy change that would take considerable time to implement and that may have unintended consequences for both investors and fund industry participants. Therefore, to the extent we may decide to move forward with a rule proposal discontinuing embedded commissions, our goal is to proactively identify and incorporate into our rule proposal various mitigation measures as well as transition options that could help alleviate any negative impacts and facilitate a successful transition to direct pay arrangements.

1. Measures to mitigate potential unintended consequences

In response to our Original Consultation Paper, several fund industry stakeholders submitted that the discontinuation of embedded commissions could have unintended consequences for retail investors and the fund industry,[141]including:

- a reduction in access to advice for lower-wealth investors due to:
    - o substantial changes to dealer business models, and
    - o reticence of investors to pay directly for advisory services;

- the elimination of choice in how investors may pay for financial advice; and

- an uneven playing field among competing products and opportunities for regulatory arbitrage.

a. Access to advice:

The data we consider in Part 4 on Canadian fund investors and the institutions that currently serve them suggests that the discontinuation of embedded commissions is not likely to lead to a significant advice gap for lower-wealth investors in Canada. Nevertheless, we recognize that such a change may (i) impact dealer business models in a way that may reduce the range and affordability of advice and (ii) affect the behavior of certain investors in a way that may reduce their use of advice.

---

[141] See CSA Staff Notice 81-323 *Status Report on Consultation under CSA Discussion Paper and Request for Comment 81-407 Mutual Fund Fees*, published on December 17, 2013, which provides a summary of the key comments received on the Original Consultation Paper.

i. Impact to dealer business models

We recognize that a transition to direct pay arrangements would involve substantial changes in current dealer business models. The transition could have the following potential impacts on dealers, among others:

- dealers may incur potentially costly changes in information technology systems, as well as changes in operational and compliance processes, that may increase the cost to provide advisory services[142];

- the transition would require dealers and their representatives to communicate with their clients to inform them of, and obtain their agreement to, the direct pay arrangement;

- going forward, dealers would need to collect their compensation directly from their clients on an individual basis, rather than be compensated on a wholesale basis through trailing commissions; this change would impose new administrative processes which may reduce efficiencies and increase costs; and

- overall revenues may be reduced due to the loss of a form of cross-subsidy from high net worth fund investors to lower-wealth fund investors; this change may increase the cost of servicing lower-wealth investors.[143]

We acknowledge that these potential impacts could be magnified for smaller independent dealers. Some dealers may not be able to adequately compensate with direct pay arrangements their loss of revenue stemming from the discontinuation of embedded commissions and the costs associated with the transition. Some dealers and their representatives may decide to refocus their business on high net worth fund investors and/or charge a fee for advisory services that some investors may not be able to afford, thus increasing the potential for certain investors to lose access to advisory services.

We anticipate that some of these impacts could be alleviated to some extent by innovations in technology, including various forms of online advice, which could be used by dealers and their representatives to automate part of the advice process.[144] The integration of such technology into the business models of dealers and their representatives could potentially add new capabilities

[142] We note these costs would be in addition to those already incurred in connection with the implementation of POS and CRM2 and the costs associated with the potential implementation of any of the CSA CP 33-404 proposals.

[143] Industry stakeholders have submitted that lower-wealth investors in a fund benefit financially from the current embedded commission structure because the cost of providing advice and services to lower-wealth investors is subsidized by the higher-wealth investors in the fund who pay more on account of their larger assets under management. It is reasonable to assume that the mandated use of direct pay arrangements would eliminate this pooling of fees from both higher-wealth and lower-wealth investors and cause the price of servicing lower-wealth investors to increase.

[144] Some Canadian firms are now offering online advice services designed for use by advisors. See note 131.

and deliver efficiencies that could make the provision of advisory services to smaller accounts more viable.

We think they could also be alleviated to a certain extent by our proposal, as discussed in Part 3, to allow investment fund managers to facilitate investors' payment of dealer compensation by collecting payments from the investor's fund investment (for e.g. deductions from purchase amounts or periodic withdrawals or redemptions from the investor's account) and remitting them to the dealer on the investor's behalf.[145]

ii. Impact to investor use of advice

We recognize there are a number of factors, including behavioral factors, which may influence the decision of investors to use financial advice.[146] For example, the requirement for investors to directly pay for advisory services provided by their representative under direct pay arrangements may affect the behavior of certain investors in a way that may reduce their use of advice. Specifically, some investors may consider direct payments less convenient relative to the current embedded commission model, which may accordingly deter them from seeking advisory services.

We also understand that retail investors' varying levels of financial literacy and lack of frame of reference as to what is a reasonable fee for advisory services may reduce their ability to assess the value of such services or to negotiate a fair fee under direct pay arrangements.

In order to address the risk that some investors may be deterred from using financial advice due to the requirement to pay upfront for their representative's services, we would propose, as discussed in Part 3, to allow investors to pay for their representative's compensation through deductions from their purchase amounts or redemptions from their investment fund holdings that would be effected by the investment fund manager and remitted to the dealer on the investor's behalf.[147]

---

[145] We recognize that not all investment fund managers may have the capability to offer this service to dealers. Some investment fund managers may need to implement new systems and processes and may therefore incur additional costs to offer this option.

[146] In their *Financial Advice Market Review: Call for input* (October 2015), https://www.fca.org.uk/publication/call-for-input/famr-cfi.pdf, the Financial Conduct Authority and HM Treasury identified eight factors preventing people from seeking financial advice. These factors include: 1) the price of advice; 2) the lack of trust investors have toward financial advisory firms; 3) investors' lack of knowledge of their need for financial advice and how to obtain it; 4) investor overconfidence – believing they do not require help in making financial decisions; 5) investors' access to face-to-face advice; 6) the lack of engagement, where investors who are disengaged with financial services are unlikely to seek financial advice; 7) the lack of skills to use new channels such as the internet if available, and 8) the lack of need for financial advice.

[147] We recognize that periodic redemptions may trigger tax consequences (i.e. capital gains or losses) for some investors. Investors would need to understand the potential tax consequences of this method of payment before agreeing to it.

A factor which may further mitigate the risk that investors may not want to pay upfront for advice is the extent to which the front-end purchase option – where investors may pay both a direct commission at the time of purchase and an ongoing embedded trailing commission – is currently used by investors in Canada. As discussed in Part 4, assets held under the front end purchase option made up 24% of the market ($298 billion) at the end of 2015, growing 93% over the previous five years. Investors who make their fund investments under the front-end purchase option may be more sensitized to upfront fees for advice and may accordingly be less affected by a transition to direct pay arrangements.

As for the issue of low financial literacy potentially hindering investors' ability to assess the value of advisory services or to negotiate fair fees for such services, the CSA anticipate continuing to work on investor literacy initiatives to increase investors' awareness of investing costs and empower them to confidently engage in the negotiation of fees with their representative. We also expect that our recent POS and CRM2 reforms (further discussed in Part 6) will improve investors' awareness and understanding of fund and dealer compensation costs in the lead up to any potential rule proposal discontinuing embedded commissions. This improved awareness and understanding in turn should give investors an initial point of reference from which to gauge the appropriateness of advisory fees under direct pay arrangements.

However, industry participants have submitted that a transition to direct pay arrangements would decrease the transparency of dealer compensation costs as investors would not have any benchmark to help them assess the reasonableness of the fees they are paying for advice. As discussed in Appendix B, the CSA considered the option of making certain enhancements to cost disclosure, including providing certain benchmarking information on product and advice costs. However, we identified certain drawbacks to that option which led us to decide not to further pursue it at this time. If we decide to proceed with the discontinuation of embedded commissions, we anticipate further exploring the potential issue of reduced cost transparency.

b. Choice for investors

Several fund industry stakeholders submit that the discontinuation of embedded commissions will eliminate the ability of investors to choose[148] the payment arrangement they prefer and that is most convenient to them, and force all investors to enter into fee-based arrangements under which they would have to pay a fee that is based on a percentage of their assets under administration.

We recognize that fee-based arrangements may not be suitable for all investors in all circumstances. Accordingly, as discussed in Part 3, we expect that further to the discontinuation of embedded commissions, dealers and representatives would offer their clients a compensation arrangement that suits their particular investment needs and objectives and reflects the level of

[148] Many fund industry stakeholders submit that investors currently have the option of choosing fee-based arrangements by investing in a fee-based series of a fund (for e.g. Series F). In Parts 2 and 4 and Appendix A of this Consultation Paper, we suggest that the fee-based series may not be a true option for all investor segments due to the fact that dealers offering fee-based arrangements typically require a minimum investment amount of $250,000 or more prior to establishing an account.

service desired. Such compensation arrangements could include commissions on trades, hourly fees, a flat fee, a fee-based arrangement, or other suitable arrangement. We would expect representatives to fully inform their clients of the types of accounts available, and the differences between those accounts, both in terms of service and cost. Our expectation is that investors would have more choice in how they may pay for advisory services further to the discontinuation of embedded commissions, not less.

c. Uneven playing field and regulatory arbitrage

Several fund industry stakeholders submit that to require mutual funds to move away from embedded commissions would create an uneven playing field between mutual funds and competing financial products with embedded commissions, including banking and insurance investment products. As discussed in Part 3, we anticipate that any rule proposal we might undertake would discontinue embedded commissions for all types of investment funds and similar products that are governed by securities regulation. The rule proposal would capture not only conventional mutual funds, but also ETFs, non-redeemable investment funds, and structured notes, whether sold under a prospectus or in the exempt market. Accordingly, this would assure a level playing field amongst investment fund and fund-like products that the CSA regulates.

We recognize the potential for regulatory arbitrage in banking and insurance products, and as discussed in Part 3, the CCIR does as well. It is examining potential gaps in the regulatory framework for segregated funds and assessing the risk of regulatory arbitrage by dually-licensed insurance agents and has indicated an intention to act proactively to amend regulation where appropriate to address this risk. The CSA plans to continue to liaise with other regulators to discuss the risk of dealers and representatives prioritizing their compensation interests over the interests of their clients by inappropriately shifting their clients' assets to other investment products with embedded fees.

<u>Questions</u>

27. How practicable are the mitigation measures discussed and how effective would these measures be at assuring:
    - access to advice for investors,
    - choice of payment arrangements for all investor segments, and
    - a level playing field amongst competing investment products?

28. What other measures should the CSA consider to mitigate the above unintended consequences?

29. Other than the potential impacts we have identified in Part 4, what other potential unintended consequences, including operational impacts and tax consequences, may arise for fund industry stakeholders and investors further to the discontinuation of embedded commissions? In particular:

    a. Would there be a negative tax impact to investors associated with their payment of dealer compensation under direct pay arrangements? In particular, would the investor's payment of dealer compensation through periodic fund redemptions facilitated by the investment fund manager attract tax consequences? Please explain.

b. To the extent a transition to direct pay arrangements results in the rationalization of fund series, could this rationalization attract negative tax consequences for investors?

c. What, if any, measures, regulatory or otherwise, could assist in mitigating potential operational and tax impacts?

30. With respect to the loss of a form of cross-subsidy from high net worth investors to lower-wealth investors in a fund further to a transition to direct pay arrangements,

a. to what extent (please quantify where possible) would the loss of this cross-subsidy increase the cost of providing advice and services to lower-wealth fund investors under direct pay arrangements?;

b. does the existence of this form of cross-subsidy suggest that high net worth fund investors may be indirectly paying fees that are not aligned with the services they are receiving (i.e. do the fees they pay exceed the actual cost of the services and advice they receive?); and

c. what measures may mitigate the potential effects on dealers, representatives and investors from the loss of the cross-subsidy?

31. What measures could fund industry participants proactively take to mitigate the unintended consequences that may stem from the discontinuation of embedded commissions?

2. Transition options

We recognize that a transition to direct pay arrangements would require fund industry participants to adopt new business models that would likely entail the use of new systems and the adoption of new processes that would take a significant amount of time to set up and implement. We also recognize that this change would have important implications for investors, and that it would be essential for fund industry participants, including investment fund managers, dealers and representatives, to successfully manage their clients' experience during a transition.

Therefore, to the extent we may decide to move forward with a rule proposal discontinuing embedded commissions, we wish to identify potential transition options that could mitigate possible negative business and client impacts that may result throughout a transition.

With the foregoing in mind, we are currently considering a number of alternative measures that could be used to assist in promoting a successful transition while minimizing any resulting negative impacts. However, before we decide to implement any particular transition option, we want to ensure we have a full understanding of, and carefully consider, each option's potential impacts and consequences.

The following provides a brief discussion of some potential transition options we could consider. We seek your feedback on these options and any other possible options.

Option 1: *Transition to direct pay arrangements within a defined transition period*

One potential option could be to discontinue all embedded commission payments within a certain time period (the **Transition Date**) after the effective date of any final rule implementing such a transition (the **Effective Date**). For greater certainty, such payments would include trailing commissions and other ongoing service fees paid to dealers by an investment fund, investment fund manager or structured note issuer, and internal transfer payments from affiliates to dealers within integrated financial service providers which are directly tied to an investor's purchase or continued ownership of an investment fund security or structured note. The sale of investment funds by means of DSC purchase options would also cease upon the Transition Date.

Under this option, existing redemption schedules set by DSC purchase options (including those entered into before the Effective Date) could either be maintained after the Transition Date until the redemption schedule is completed (i.e. redemption fees could continue to be charged until the schedule expires in its normal course), or discontinued contemporaneously with all other payments at the Transition Date.

In our view, to successfully achieve a transition to direct pay arrangements, dealers would need sufficient time to design and implement direct pay arrangements, and representatives would need to meet with their clients to explain the upcoming changes and their associated impact.

Likewise, investment fund managers and structured note issuers would need sufficient time to modify affected areas of their business. For instance, we anticipate that issuers will likely rationalize the number of purchase options or series options offered for their investment fund products as a result of a transition to direct pay arrangements. Disclosure documentation will also need to be revised to account for changes that may result from the transition (for example, to account for the specific fees that may apply following the transition periods, or to account for any change in the number of purchase and series options).

Investment fund managers, structured note issuers, dealers and representatives would also need time to make necessary system, compliance, procedural and process changes needed to implement the potential transition. Issuers and dealers will also need time to coordinate and cooperate to successfully manage the associated client impact resulting from the transition (for example, to move clients from one series of a fund to another to the extent certain series are no longer offered).

Given what we understand will need to be completed by investment fund managers, structured note issuers, dealers and representatives, we recognize that it will be imperative to provide sufficient time to all affected parties to ensure a successful transition. In this regard, we suggest that a Transition Date of 36 months after the Effective Date could provide sufficient time to complete all required transition steps. We are open to other transition periods and encourage stakeholders to specifically comment on this point.

Option 2: *Transition to direct pay arrangements by account*

An alternate option could be to transition to direct pay arrangements in phases, by phasing in a dealers' account base over multiple periods. This approach would require dealers to transition a certain percentage of accounts by a certain date, a further percentage by a later date, and so on until all accounts have fully transitioned.

Similar to option 1, existing redemption schedules set by DSC and low-load purchase options (including those entered into before the transition) could either be maintained until the redemption schedule is completed (i.e. redemption fees could continue to be charged until the schedule expires in its normal course), or discontinued contemporaneously with all other payments at the Transition Date. Consistent with option 1, we anticipate that if the Transition Date were 36 months after the Effective Date, it could provide sufficient time to transition to the final percentage of accounts, but are open to other transition periods and encourage stakeholders to specifically comment on this point.

We recognize that there may be some logistical and practical constraints in transitioning to direct pay arrangements via a phased-in approach. For example, it may be difficult to coordinate tailored disclosure for investment products with the various time points, and it may also be difficult for issuers to rationalize their series and purchase options. We are therefore interested in your feedback on these potential approaches.

Questions

32. For each transition option, please tell us how your business (investment fund manager or dealer) would have to operationally change or restructure in terms of systems and processes and the related cost implications. Where possible, please provide data on the estimated costs.
    - Are there unique costs or challenges to specific businesses?
    - What transition period would be appropriate?
    - Should existing redemption schedules for DSC and low-load purchase options be maintained until the redemption schedule is completed, or discontinued at the Transition Date?

33. Which transition option would you prefer? Why? Are there alternative transition options that we should consider?

34. As discussed in Appendix B, the CSA did not retain the option of capping embedded commissions, either as a stand-alone solution to the key issues discussed in Part 2 or as an interim step toward an eventual discontinuation of embedded commissions. Should the CSA further consider using a fee cap as a transition measure? Why?

PART 6 – RELATED REGULATORY INITIATIVES AND EXISTING TOOLS

In this part, we consider the extent to which related CSA initiatives and existing regulatory tools may help address the market efficiency and investor protection issues we identified in Part 2. The initiatives and tools discussed below include:

1. The POS and the Client Relationship Model (**CRM**) disclosure requirements and enhancements;
2. Compliance review initiatives; and
3. The proposals under CSA CP 33-404.

1. Discussion of Point of Sale & CRM

Overview of POS and CRM reforms

Over the last several years, the CSA have through the POS and CRM reforms, enhanced the disclosure of fund fees and dealer compensation provided to investors at the point of sale, at account opening, and in the account performance reporting process. The POS and CRM reforms aim to improve investors' awareness and understanding of the initial and ongoing costs associated with their investment, including their dealer's compensation, in order to enable them to:

- make a more informed investment decision at the time of the initial sale; and

- assess the cost of the services their dealer and representative provides over the course of the registrant-client relationship.

The fee disclosure enhancements under the POS and CRM reforms are briefly summarized below.

i. Point of Sale

The POS reforms introduced the four page fund facts disclosure document that, as at June 13, 2014, has replaced the lengthier simplified prospectus as the document that dealers are required to send or deliver to investors in connection with a trade in a conventional mutual fund. As at May 30, 2016, the fund facts is required to be delivered to the investor 'pre-trade'; that is, before the dealer accepts an instruction from the purchaser for the purchase of the security.

The fund facts aims to improve fee transparency by disclosing, in summary form, the costs of buying, owning, and selling conventional mutual fund securities. The costs disclosed include:

- the sales charges that an investor may pay at the time of purchase and any deferred sales charges that an investor may pay if the securities are redeemed within a specified period after purchase, each expressed in percentages and in dollars based on a $1,000 investment;

- the commission, expressed on a percentage basis, that the investment fund manager pays to the dealer for purchases made under the DSC option;

- the range of the trailing commissions paid by the investment fund manager to the dealer for each purchase option, expressed both in percentages and in dollars based on a $1,000 investment; and

- the management expense ratio, trading expense ratio, and fund expenses, expressed in percentages. The fund expenses are also expressed in dollars based on a $1,000 investment.

To alert investors to the conflict of interest created by embedded compensation such as trailing commissions, the foregoing cost disclosure is required to be prefaced by a statement that “higher commissions can influence representatives to recommend one investment over another”. The disclosure also includes a general description of what trailing commissions pay for.

While the fund facts document currently only applies to conventional mutual fund securities, the CSA will, at the time of publication of this Consultation paper, have published final rules introducing a similar summary disclosure document for exchange traded funds, called “ETF Facts”.

ii. <u>CRM</u>

The CRM reforms, which have been implemented in phases over the last several years, introduced new requirements in a number of areas related to a client’s relationship with a registrant. The first phase of CRM introduced relationship disclosure information delivered to clients at account opening (by explaining, for example, the types of products and services provided by the registrant), and comprehensive conflicts of interest requirements. CRM2 introduced new disclosure requirements relating to investment performance at the account level and the commissions and other amounts paid to dealers. A particular objective of this second phase was to increase mutual fund investor’s awareness of trailing commissions paid to dealers. CRM2 was not intended to address product costs. Generally, the CRM reforms apply broadly to all types of securities held by a client.

As a result of the CRM reforms, at account opening, clients are now provided with more fulsome information on charges, including transaction charges, which they may expect to pay in connection with their investment. Where the investment is in mutual funds, for example, the information should include:

- the management fee paid by the fund;

- the initial sales charge and DSC options available to the client (along with an explanation of how such charges work); and

- any trailing commissions or other embedded fees paid in connection with the investment.

Following a transaction, clients are provided with a trade confirmation that includes disclosure of each transaction charge, deferred sales charge or other charge applying to a transaction, and the total amount of all charges. Thereafter, on an annual basis, the report on charges and other compensation now provides a summary of all charges incurred by the client and all compensation received by the dealer that relates to each account the client holds with the dealer, including:

- the total dollar amount of each type of transaction charge related to the purchase or sale of securities paid by the client during the period covered by the report, and the total amount of those charges;
- the total dollar amount of each type of payment, other than a trailing commission, that is made to the dealer or any of its representatives by a securities issuer or another registrant (e.g. an investment fund manager) in relation to registerable services to the client – this amount captures upfront commissions that investment fund managers pay to dealers for sales made under DSC arrangements; and
- the total dollar amount of trailing commission received by the dealer in connection with securities held in the client's account, accompanied by a statement advising the client that the trailing commission is paid by investment fund managers, that its amount varies depending on the purchase option selected, and that these fees affect the client because they reduce the amount of the fund's returns.

The client's annual investment performance report for each account held with the dealer also includes the following information to better enable the client to evaluate how their investments have performed:

- a detailed breakdown of all deposits into and withdrawals out of the account;
- the change in market value of the account (in dollars); and
- the annualized total percentage return of the account for the previous year, as well as the previous three, five, and ten years.

How POS and CRM may address the identified issues

The CSA will monitor the impact of the POS and CRM.[149] While we expect it will be a number of years before these impacts may be fully evaluated, generally, we expect the reforms to appreciably improve investors' awareness and understanding of mutual fund costs and performance, and make them more informed consumers of investment fund products and advice services. We anticipate that these improvements will partially address the key issues we have identified.

[149] The CSA recently began a multi-year research project to measure the impacts of CRM2 and POS on investors and the industry. The research will measure outcomes related to investor knowledge, attitude and behavior, registrant practices, and fund fees and product offerings. It will cover activity from 2016 through 2019 and is expected to be completed in 2021.

The following discussion provides further analysis for each of the key issues:

- Issue 1 – Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors

We anticipate that the enhanced disclosure required at the time of sale (by the POS reforms), at account opening and annually thereafter (by the CRM reforms) will lead to increased transparency of fund costs and dealer compensation. The increased transparency should better enable investors to compare the costs of investing in one mutual fund over another, which should equip investors with better tools to manage the impact of fund costs on their returns.

The introduction of account performance reporting coupled with the heightened transparency of fund costs and dealer compensation (and in particular trailing commissions) may also cause investors to question the services that their representatives provide and allow investors to better assess the true costs and value of the services they receive. This awareness in turn may, over time, lead to changes in the consistency and level of services provided by dealers and representatives to investors, and the selection of lower-cost funds and, possibly, better performing funds. To the extent this occurs, we anticipate that investment fund managers may respond to dealers' different product demands by producing lower-cost funds and focusing more on performance, thus potentially increasing competition and market efficiency. The investment fund manager response may be further shaped by the extent to which the POS and CRM reforms may cause clients to also question the cost of the investment fund manager.

Overall, these potential positive effects of enhanced disclosure on the registrant-client relationship and investment fund manager behavior may combat some of the harms resulting from Issue 1. However, we believe disclosure alone may fall short of fully addressing the inherent conflicts of interest under Issue 1 for the reasons below:

i. The research we have reviewed (see Part 2 and Appendix A) suggests that, as long as product embedded commissions continue to be permitted,

    a. the compensation bias in such commissions may continue to incent dealers and their representatives to recommend to investors products that give priority to maximizing revenue over the interests of clients – potentially impairing investor outcomes and market efficiency; and

    b. investment fund managers will continue to be incented to compete for sales on the basis of the compensation they pay dealers, reducing the likelihood that they will compete on the basis of performance and skill – potentially disadvantaging skilled fund managers who do not pay higher than standard trailing commissions or who do not pay any trailing commissions. As discussed in Part 2, this incentive can drive up fund costs overall and limit the availability of low-cost and passively managed funds, thus impairing competition and market efficiency;

ii. Research has shown that disclosure alone may not be an effective remedy at addressing conflicts of interest in an advisor-client relationship. Specifically, research suggests that advisors provide more biased advice when a conflict of interest is disclosed than when it is not, and that advisees may not sufficiently discount the advice to counteract the increased bias.[150] Further research also suggests that disclosure of a conflict of interest can have unintended, perverse effects such as advisees being more likely to follow conflicted advice.[151] To the extent such effects occur in the advisor-client relationship as a result of the disclosure, advice and decision making may be suboptimal leading to poor investor outcomes and decreased market efficiency; and

iii. Investors' high level of trust and reliance on their advisors for investment decisions may cause them to not thoroughly review disclosure documents and reports, and thus limit the benefits to be derived from disclosure. For example, a recent study conducted by the British Columbia Securities Commission (**BCSC**) found that, among other things, 89% of respondents described their existing level of trust in their investment representative as strong or very strong. This trust led some clients to place less importance on reading their account statements because they were confident that their representative was taking care of their investments.[152] Similarly, a recent survey conducted by the CSA shows that investors' primary source of investment information is their advisors, with 43% of investors classified as exclusively relying on their advisor.[153] To the extent that clients do not rely on disclosure for their investment decisions, the resulting benefits of the disclosure may be limited as they may not be fully informed with respect to all account fees and performance, and may not fully or effectively question or assess the services provided.

- Issue 2 – Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

As discussed in connection with Issue 1 above, the enhanced and more prominent disclosure of fund fees, including embedded dealer compensation, should increase an investor's awareness and understanding of such costs and better equip them to manage the impact of those costs on their investment returns.

However, to the extent dealer compensation continues to be paid out of fund management fees, we think the POS and CRM reforms may only partially address Issue 2 for the reasons below:

i. The fund fee structure will remain relatively complex which, as discussed in Part 2, may continue to impede investors' understanding of dealer compensation costs and fund fees;

[150] Daylain M. Cain, George Loewenstein and Don A. Moore, "The Dirt on Coming Clean: Perverse Effects of Disclosing Conflicts of Interest", *The Journal of Legal Studies*, Vol. 34, No. 1 (January 2005), pp. 1-25, http://www.arts.uwaterloo.ca/~dkoehler/ACC784/CainLoewensteinMoore2006.pdf.

[151] Sunita Sah, "The Paradox of Disclosure", *The New York* Times, July 8, 2016, http://nytimes.com/2016/07/10/opinion/sunday/the-paradox-of-disclosure.html?_r=0.

[152] BC Securities Commission, National Smarter Investor Study, Public Opinion Research (November 2015), https://investright.org/wp-content/uploads/2016/09/Smarter-Investor-Study-FULL-REPORT-1.pdf.

[153] The CSA Investor Education Study 2016, https://www.osc.gov.on.ca/documents/en/About/csa_investor-education-study.pdf.

ii. Investment fund managers will continue to determine the compensation paid to the dealer without any direct involvement of the client. This current arrangement limits a client's engagement in the dealer compensation process and consequently limits their awareness and control over that compensation.

Discontinuing embedded commissions would remove the investment fund manager from the dealer compensation process and enable the direct involvement of the client with their representative over the compensation paid. This involvement in turn may lead to greater fee awareness, as well as create opportunities for a client to negotiate, and have greater control over, the ultimate compensation paid.

- Issue 3 – Embedded commissions paid generally do not align with the services provided to investors

As noted in Issue 1 above, the increased performance reporting coupled with the increased saliency of fund costs and dealer compensation should cause investors to question the services provided by their representative. To the extent that investors respond to fund fee disclosure under CRM2 by either questioning the overall level of services and advice they are receiving from their representative or switching to lower-cost alternatives, we would expect the representative to respond by demonstrating their value proposition and reviewing the level of services provided. To the extent this change occurs, these disclosure reforms may improve the alignment between the embedded dealer compensation paid and the services provided to investors and therefore assist in addressing Issue 3. Nevertheless, embedded commissions will remain a "one-size-fits-all" fee that may not align well with the services and advice actually provided to individual investors in accordance with their specific needs, expectations and preferences. This misalignment in turn may cause some investors to pay more fees than necessary relative to the services received, thus impeding investment returns.

2. Discussion of Compliance Review Initiatives

Overview of the compliance review initiatives

Some CSA members are completing various compliance review initiatives on sales incentives that may give rise to conflicts of interest when distributing investment funds. In certain cases, the compliance initiatives are also being coordinated with the MFDA and IIROC.

While some reviews are completed and others are ongoing, the reviews include an examination of, among other things, practices that are designed to influence the selection of investment funds for distribution by a representative to clients. For example, in early 2016, the Ontario Securities Commission (**OSC**) completed a focused review of mutual fund sponsored conferences organized and presented by investment fund managers to assess compliance with NI 81-105. The OSC and the Autorité des marchés financiers (**AMF**) have also issued a survey requesting information from a sample of investment fund managers relating to management fee discounts that are based on total assets held by a dealer.

How the compliance review initiatives may address the identified issues

The CSA will monitor the results of the compliance reviews to determine the full extent to which the review addresses each of the market efficiency and investor protection issues identified. While the full effect of the reviews remains to be determined, the CSA do not at this time anticipate that the initiatives will, on their own, materially address the identified key issues.

The following discussion provides further analysis for each of the key issues:

- Issue 1 – Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors

The CSA expect that the reviews may reduce the incidence of inappropriate practices designed to drive sales. To the extent inappropriate practices designed to drive sales are reduced, the CSA anticipate a reduced incentive for products to be recommended on the basis of inducements received by the representative – potentially leading to a shift in recommendations from funds that were inappropriately favored to those that may be more suitable for an investor. If these funds are better performing funds, the shift in recommendations may reward better performing investment fund managers with an increase in market share, which should in turn lead to greater competition in the marketplace and efficiency in general (as investment fund managers would face increasing pressure to compete on the basis of performance, and not on incentives they offer to dealers).

Given the foregoing, the CSA expect that the review may partially assist in addressing Issue 1. However, we do not anticipate that the review will fully address Issue 1 primarily because the payment of trailing commissions and other forms of embedded compensation will continue to be permitted. As a result, the conflicts of interest facing dealers and representatives will continue to be present, which may continue to encourage investment recommendations that may impair investor outcomes. Additionally, the continued presence of embedded commissions will not address the conflicts that exist at the investment fund manager level, maintaining the potential for underperformance and higher-costs overall.

- Issue 2 – Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

The CSA do not expect the outcomes of the review to address Issue 2. As this initiative will be focused on incentives provided to dealers and representatives and is not disclosure or client focused, it is not expected to increase investors' overall awareness, understanding and control of dealer compensation costs and fund fees. Additionally, we do not anticipate the review having any impact on reducing the complexity of the mutual fund fee structure or on the industry generally.

- Issue 3 – Embedded commissions paid generally do not align with the services provided to investors

The CSA also do not expect the outcomes of the review to address Issue 3. Similar to Issue 2, as this initiative will be focused on incentives provided to dealers and representatives and is not disclosure or client focused, there are no aspects of this review that are expected to directly increase the alignment between embedded commissions and services provided to fund investors.

3. Discussion of the proposals to enhance the obligations of advisers, dealers and representatives toward their clients outlined in CSA Consultation Paper 33-404

Overview of CSA Consultation Paper 33-404

On April 28, 2016, the CSA published CSA CP 33-404 seeking comment on proposed regulatory action aimed at enhancing the obligations and duties of advisers, dealers, and representatives toward their clients. The proposals, which are in response to issues the CSA identified in the client-registrant relationship, include measures to:

- better align the interests of registrants to the interests of their clients;
- clarify the nature of the client-registrant relationship; and
- improve outcomes for clients.

The concept proposals outlined in CSA CP 33-404 introduce a number of targeted reforms to National Instrument 31-103 *Registration Requirements, Exemptions and Ongoing Registrant Obligations* that include, among others, proposals to strengthen the regulation of conflicts of interest, the know-your-client (**KYC**) and KYP requirements, the suitability obligation, proficiency of representatives, and the use of titles.

For example, with respect to the regulation of conflicts of interest, dealers and representatives would be required to respond to each identified material conflict of interest in a manner that prioritizes the interests of the client ahead of their own. Moreover, any disclosure given to a client about a conflict of interest would need to be prominent, specific, and clear. Importantly, the disclosure should be meaningful to the client to allow the client to fully understand the conflict, including the implications and consequences of the conflict for the client. CSA CP 33-404 states that disclosure alone is a generally inadequate mitigation mechanism because of its limited impact on a client's decision-making process.[154] That consultation paper also provides guidance on specific conflict of interest situations related to compensation practices.

The KYC process would also be improved to ensure it results in a thorough understanding of the client, and as a result would require a representative to gather more client-centered information relating to the client's investment needs and objectives, financial circumstances, and risk profile.

Amendments to the KYP process would explicitly require representatives to have sufficient knowledge of a product, together with the KYC analysis, to support a proper suitability analysis. Ultimately, this process would require representatives to thoroughly consider, among other things, the product strategies, features, costs and risks of each security on the firm's product list. Moreover, representatives would be required to understand and consider how a product being

[154] See CSA CP 33-404, Appendix A.

recommended compares to other products and how the recommendation would fit within the client's account and overall strategy.

Dealers would be required to identify whether they have a proprietary or mixed/non-proprietary product shelf. Dealers with a mixed shelf would be required to undertake a fair and unbiased market investigation of a reasonable universe of products to satisfy themselves they have a range of products that are most likely to meet the investment needs and objectives of its clients based on its client profiles.

The suitability analysis would also be reinforced to ensure that recommendations satisfy the following three broad elements: basic financial suitability, investment strategy suitability, and product selection suitability. Of note, the product selection suitability determination would need to take into account the impact on the performance of the product of any compensation paid to the registrant by the client or a third party in relation to the product.

The proposals would also introduce new requirements aimed at increased proficiency for representatives, including increased proficiency of how product costs and investment strategies (such as active and passive) can impact investment outcomes for clients.

In addition to the targeted reforms discussed above, all of the CSA jurisdictions other than the BCSC are consulting on a regulatory best interest standard, accompanied by guidance, that would form both an over-arching standard and governing principle against which all other client-related obligations would be interpreted. Generally, a regulatory best interest standard would require that a registered dealer and its representatives deal fairly, honestly, and in good faith with its clients and act in its clients' best interests. Several CSA members have expressed strong reservations relating to the adoption of a regulatory best interest standard.

If the potential reforms outlined in CSA CP 33-404 are implemented, they would cover a broad spectrum of obligations for registrants and apply to all advisers, dealers and representatives, including those who are members of IIROC and the MFDA. Ultimately, these potential reforms are intended to work together to improve the overall client-registrant relationship.

How the CSA CP 33-404 proposals may address the identified issues

It is important to note that the concept proposals discussed in CSA CP 33-404 are not specifically designed to address the key investor protection and market efficiency issues identified in this Consultation Paper. The CSA will however monitor the development of those proposals over the consultation process and continue to evaluate the extent to which they may address our key issues. We consider that the potential reforms discussed in CSA CP 33-404 may, to the extent they are adopted in their current form, better align the interests of registrants with the interests of their clients, clarify the nature of the client-registrant relationship and improve outcomes for investors overall. The CSA expect that these potential reforms may assist in addressing, to a partial extent, the investor protection and market efficiency issues we have identified in this Consultation Paper.

The following discussion provides further analysis for each of the key issues:

- <u>Issue 1 – Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors</u>

The CSA anticipate that the potential reforms discussed in CSA CP 33-404 would, if implemented, lead to better conflict of interest management that may, in turn, assist in mitigating the conflict of interest that embedded commissions raise for dealers and representatives. We are of this view for several reasons, including because representatives would be required to respond to conflicts of interest in a manner that prioritizes the interests of the client ahead of their own. With respect to dealer compensation, for example, dealers would need to assess whether any remuneration could reasonably be expected to inappropriately influence how representatives interact with their clients. To the extent that the compensation gives rise to a conflict, firms would need to ensure that there are adequate controls and oversight in place to mitigate the conflict. Importantly, if the conflict cannot be managed, it must be avoided.

We are also of the view that the CSA CP 33-404 proposals would lead to better conflict of interest management because dealers and representatives would specifically be required to consider the impact of their compensation on performance as part of the suitability analysis. To the extent a product is recommended because it benefits the dealer or representative, but there is another equally suitable product on the dealer's product list that would be less costly for the client, such recommendation would not comply with the suitability obligation or the dealer's general duties to their client.

As a result of the foregoing, the CSA anticipate that tied forms of compensation may play less of a role in product recommendations. Combined with the enhancements to KYC, KYP, suitability, and proficiency, the CSA anticipate that representatives' recommendations may shift to more suitable products that may be lower-cost and, possibly, better performing products. To the extent that the CSA CP 33-404 proposals result in shifts in product recommendations toward lower-cost and better performing products, we anticipate that those proposals may also have an indirect effect over time on investment fund managers as they may respond to these shifts by producing lower-cost funds and placing a greater emphasis on performance. This shift would potentially reward better performing investment fund managers with increased market share, thereby improving competition and market efficiency.

Given the apparent benefits of the foregoing, the CSA expect that the concept proposals outlined in CSA CP 33-404 (if adopted in its current form), in combination with the POS and CRM reforms as well as the compliance review initiatives, may address Issue 1. For the following reasons, we are nevertheless considering whether discontinuing embedded commissions may also be necessary.

Firstly, the proposals were not developed to address the conflict that embedded commissions raise at the investment fund manager level. As a result, the anticipated positive effects of the proposals on investment fund manager behavior (i.e. production of lower-cost funds and increased focus on performance), as well as the consequential positive effects on competition and market efficiency, are dependent on the effect the proposals have on representatives' recommendations. While the extent to which representatives' recommendations would shift remains to be determined, there are certain aspects of the proposals that may lessen its ultimate impact on investment fund manager behavior, competition and market efficiency generally.

Until such time as dealer recommendations shift to the degree necessary to trigger change at the investment fund manager level (if at all), investment fund managers may continue to be incented to rely more on the payment of embedded commissions rather than on skill to sell their products and gain market share. As discussed in Part 2 above, the payment of embedded commissions can reduce a manager's focus on performance and lead to underperformance.

Secondly, the payment of embedded commissions is not addressed under CSA CP 33-404. Embedded commissions may continue to create a barrier to entry that may reduce the likelihood of lower-cost providers entering the market. As discussed in Part 4, the entrance of lower-cost providers may place competitive pressure on fund costs and encourage the manufacturing and distribution of lower-cost funds. Embedded commissions may also dampen the extent to which independent investment fund managers are able to access the IIROC and independent mutual fund dealer distribution channels. Taken together, these effects may limit price competition and market efficiency.

Finally, in our view, a potential discontinuation of embedded commissions may complement the concepts outlined in CSA CP 33-404. We are of this view because a discontinuation may remove the conflict of interest that embedded commissions raise for dealers, representatives and investment fund managers and may better align their interests with those of investors.

- Issue 2 – Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

CSA CP 33-404 was not designed to address Issue 2. While transparency of fees may increase to the extent embedded dealer compensation arrangements are disclosed as part of the conflict of interest mitigation process, investment fund managers would still continue to determine the compensation paid to dealers without any direct involvement of the client. The lack of direct client involvement in the dealer compensation process may limit fee awareness, as well as the level of control a client has over the compensation ultimately paid to their dealer and their representative for the services provided. Moreover, the presence of embedded compensation may continue to make the fee structure more complex, which may continue to inhibit investors' understanding of such costs.

- Issue 3 – Embedded commissions paid generally do not align with the services provided to investors

CSA CP 33-404 was also not designed to address Issue 3. The CSA expect that the enhancements to KYC, KYP, suitability, and proficiency requirements, along with improved conflict of interest mitigation, may encourage the provision of advice and services to investors that better meet their needs and objectives. However, embedded commissions will still remain a "one-size-fits-all" fee that may not align well with the services and advice actually provided to individual investors in accordance with their specific needs, expectations and preferences. This misalignment may cause some investors to pay more fees than necessary relative to the services received, thus impeding investment returns.

Questions

35. Please explain whether you think each of the initiatives discussed above will, either alone or in combination:

    - address the three investor protection and market efficiency issues and their sub-issues identified in Part 2; and

    - address or not address any additional harms or issues that you have identified.

36. Are there alternative options or measures, whether regulatory or market-led, that could successfully address the three investor protection and market efficiency issues and their sub-issues identified in Part 2. If so, please explain.

PART 7 – COMMENT PROCESS AND NEXT STEPS

The issues addressed in this Consultation Paper are important ones which affect all participants in the Canadian capital markets. Due to the broad impact of the policy option discussed in this Consultation Paper, the contribution of stakeholders is important. We invite all interested parties to make written submissions.

Some CSA jurisdictions will hold in-person consultations in 2017 to facilitate additional feedback and further our consideration of the issues discussed in this Consultation Paper. The details of any in-person consultations will be announced.

Once we have considered the feedback received through the written comment process and any in-person consultations, we will decide on the appropriate policy response, if any, communicate our policy direction and propose any necessary rule changes to implement the policy. Any rule proposal would be published for comment in accordance with the regular rule-making process.

Please submit your comments in writing on or before **June 9, 2017**. You may provide written comments in hard copy or electronic form. If you are not sending your comments by email, please send a CD containing the submissions (in Microsoft Word format).

Certain CSA regulators require publication of the written comments received during the comment period. We will publish all responses received on the websites of the Autorité des marchés financiers (www.lautorite.qc.ca), the Ontario Securities Commission (www.osc.gov.on.ca), and the Alberta Securities Commission (www.albertasecurities.com). Therefore, you should not include personal information directly in comments to be published. It is important that you state on whose behalf you are making the submission.

Please address your submission to all of the CSA as follows:

British Columbia Securities Commission
Alberta Securities Commission
Financial and Consumer Affairs Authority of Saskatchewan
Manitoba Securities Commission
Ontario Securities Commission
Autorité des marchés financiers
Financial and Consumer Services Commission, New Brunswick
Superintendent of Securities, Department of Justice and Public Safety, Prince Edward Island
Nova Scotia Securities Commission
Securities Commission of Newfoundland and Labrador
Superintendent of Securities, Northwest Territories
Superintendent of Securities, Yukon
Superintendent of Securities, Nunavut

Deliver your comments **only** to the addresses below. Your comments will be distributed to the other participating CSA regulators.

APPENDIX A
EVIDENCE OF HARM TO INVESTOR PROTECTION AND MARKET EFFICIENCY FROM EMBEDDED COMMISSIONS

Issue 1: Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors

i. Embedded commissions can reduce the investment fund manager's focus on fund performance, which can lead to underperformance

Trailing commissions and DSC arrangements may influence fund flows and negatively impact fund performance:

Research by Douglas Cumming et al[155], examining whether sales and trailing commissions influence fund sales and using fund level data provided by Canadian investment fund managers, finds that trailing commissions insulate the investment fund manager by reducing flow sensitivity to past performance, evidencing the misalignment of interests associated with embedded commissions. Key findings from the research included:

- All flows, with the exception of flows originating from affiliated dealers of the investment fund manager, are sensitive[156] to past performance. Funds that outperform receive more sales, while funds that underperform receive less sales;

- The sensitivity of fund sales to past performance is considerably reduced when:

  a. investment fund managers pay embedded commissions to dealers/representatives – the greater the payment, the greater the level of net flows that is indifferent to past portfolio manager skill (i.e. alpha). At a 1% trailing commission – the amount typically paid by front end equity/balanced funds and funds-of-funds in Canada today – the investment fund manager could expect inflows to increase by 0.3% of assets per month or 3.7% per year, regardless of past performance. Similarly, a 1.5% trailing commission was found to increase the average monthly flows by 0.45% of assets under management each month or 5.4% per year regardless of past performance. On the converse, the research found that fund flows for mutual fund series that do not pay embedded commissions (fee-based series) are more sensitive to past performance; and

[155] Douglas Cumming et al., supra, note 3.

[156] 'Sensitivity' is referring to the relationship between past risk-adjusted outperformance and future fund flows after controlling for all other product specific factors (e.g. fund type, risk classification, series type, etc.) that may provide a reason for investors and their dealers/representatives to select the product.

b. investors are invested under the DSC option. Investments under that option show the lowest sensitivity to past performance out of all purchase options, which reflects the impact of the redemption fee on investor behavior; it may deter investors from redeeming even in the face of consistently poor performance.

- The payment of trailing commissions impacts the relationship between performance and fund sales such that, for any increase (decrease) in performance, inflows (outflows) are 15% less than what they would be in the absence of trailing commissions.

- Reduced sensitivity to past performance also impacts future fund performance and this result applies to funds that pay embedded commissions, funds sold under DSC arrangements and funds that receive affiliated dealer flows. For example, an increase in trailing commissions and sales commissions under the DSC by 1% is indirectly associated with a reduction in future outperformance before fees by 1.4% and 0.6% respectively, relative to the average monthly performance. This finding potentially suggests that investment fund managers who pay trailing commissions to dealers, understanding that outperformance may not be rewarded with additional inflows, may have a tendency to cease trying to outperform.

Consistent with the Cumming et al. research, a *study by Susan Christoffersen et al*[157] which examined fund flows between 1993 and 2009 among U.S. mutual funds with loads or revenue-sharing found that higher payments to fund brokers lead to higher inflows and that net returns are approximately 50 basis points lower for every 100 basis points of loads.

In contrast to the above research, a *study by Investor Economics for the Investment Funds Institute of Canada*[158] argues that no single factor can satisfactorily explain the volume of mutual fund sales and redemptions into a specific fund at a given point in time. Rather, their study asserts that the flow activity in and out of Canadian mutual funds reflects the interplay of more than 40 factors, of which they argue the following three to be the most relevant:

i. macro-economic and demographic factors;

ii. individual fund investment return characteristics; and

iii. preferred access to distribution, via either direct affiliation or strategic alliance.

Funds that pay commission tend to underperform those that do not:

The *Mutual Fund Fees Research by the Brondesbury Group*[159], evaluating the extent to which the use of fee-based versus commission-based compensation changes the nature of advice and impacts investment outcomes, while not finding evidence that fee-based arrangements produce better outcomes for investors, finds conclusive evidence that commission-based compensation creates problems that must be addressed. They find, among other things, that funds that pay a commission (sales loads and trailing commissions) underperform those that do not, whether looking at raw, risk-adjusted or after-fee returns.

A *study by Jonathan Reuter*[160] similarly finds evidence that the payment of dealer compensation impairs fund performance. Specifically, this study finds over a 10-year period that when actively managed non-specialized U.S. equity mutual funds are sold through brokers, they underperform similar actively managed funds sold directly to investors (i.e. sold without the intermediation of a dealer) by an average of 0.65% on a risk-adjusted basis. When performing the comparison without 12b-1 fees (i.e. the U.S. form of trailing commissions), the average 10-year return for direct-sold funds held a 0.42% point advantage over broker-sold funds, using a value-weighted comparison.

Embedded commissions may increase flow volatility and decrease gross returns:

A *study by the Office of Economic Analysis of the U.S. Securities and Exchange Commission* (**SEC**)[161] that empirically tests the benefits to fund shareholders of 12b-1 fees (i.e. the U.S. equivalent of trailing commissions) finds no apparent benefits accruing from such payments to fund unitholders. Overall, while funds with 12b-1 fees attract higher flows and accordingly grow faster than funds without them[162], they appear to increase flow volatility[163] and decrease gross returns. The SEC notes that the results of the research

[161] Lori Walsh, SEC Office of Economic Analysis, *The Costs and Benefits to Fund Shareholders of 12b-1 Plans: An Examination of Fund Flows, Expenses and Returns*, April 26, 2004, https://www.sec.gov/rules/proposed/s70904/lwalsh042604.pdf.

[162] Ibid, at page 10, the SEC Office of Economic Analysis states: “[F]unds with 12b-1 plans obtain significantly higher annual net flows than do funds without 12b-1 plans. Fund portfolios with a weighted-average 12b-1 fee of 0.34% had 4% higher flows than similar non-12b-1 funds. This is significant considering that the average net flow is 8% annually. Funds with 12b-1 fees thus have grown more quickly than funds with no 12b-1 fund fees.”

[163] ‘Flow volatility’ means the volatility of fund purchase and redemption flows which may increase liquidity costs.

highlight the conflict of interest that 12b-1 plans create – investment fund managers use fund unitholder money to pay for asset growth from which the investment fund manager is the primary beneficiary through the collection of higher fees and the unitholders are not obtaining the benefits they should from the payments of 12b-1 fees.

ii. Embedded commissions can encourage dealers and representatives to make biased investment recommendations which may negatively affect investor outcomes

Commissions encourage biased representative recommendations:

The *research by Douglas Cumming et al*[164] referenced above showed that a rise in trailing commissions reduces the sensitivity of fund flows to past risk adjusted performance (i.e. portfolio manager skill), suggesting that these payments bias dealers/representatives toward funds that pay higher trailing commissions, and away from funds that do not pay industry standard trailing commission rates, regardless of their performance;

The *study by Susan Christoffersen et al*[165] referenced above found that higher payments to U.S. fund brokers led to higher inflows, suggesting that brokers' recommendations are biased by the payments they receive;

A *study by Daniel Bergstresser et al.*[166] examining broker-sold and direct-sold funds in the U.S. from 1996 to 2004 found "that flows in broker-sold funds are positively related to distribution fees, suggesting that sales in the broker sector might reflect broker compensation incentives.";

The *Mutual Fund Fees Research by the Brondesbury Group*[167], referenced above found that:

- higher embedded commissions drive mutual fund sales;
- financial advisor recommendations are sometimes biased in favour of higher commission generating products; and
- commissions affect the effort made by financial advisors to overcome investor behavioral biases, including biases that may lead to sub-optimal returns;

[164] Douglas Cumming et al. supra, note 3.

[165] Susan Kerr Christoffersen et al, supra, note 157.

[167] The Brondesbury Group, supra, note 3.

A *study by John Chalmers and Jonathan Reuter*[168] studying the impact of financial advisors on the retirement portfolios of a large sample of U.S. public college and university employees finds empirical evidence that commissions, rather than the suitability of financial products, drive sales. Chalmers and Reuter conclude in their analysis that "funds paying higher broker fees receive economically and statistically significantly higher retirement contributions from broker clients. Our evidence that broker incentives influence broker recommendations highlights the agency conflict that can arise when financially unsophisticated investors seek advice from intermediaries."[169]

A *study by Sendhil Mullainathan et al*[170]**,** using an audit methodology where trained auditors met with U.S. retail commission-based financial advisors and presented different types of portfolios, examined whether advisors reinforce investor biases that help further the advisor's own economic interests. The study found that financial advisors fail to de-bias their clients and often reinforce biases that are in the advisor's interests. Financial advisors encourage returns-chasing behavior and push for actively managed funds that have higher fees, even if the client starts with a well-diversified low-fee portfolio. The researchers state that "[t]he evidence suggests that most of the interaction is driven by the need to generate fees rather than to respond to the client's rebalancing needs."[171]

Embedded commissions incent unsuitable use of DSC arrangements:

In addition to embedded trailing commissions, there is evidence that embedded commissions paid by investment fund managers to dealers/representatives on sales made under the DSC option can similarly incent unsuitable recommendations. A recent *MFDA compliance review* completed in December 2015[172] uncovered instances of the inappropriate use of the DSC option. The MFDA examined the use of that option, particularly with senior clients, and dealers' supervision, suitability assessment, and disclosure practices in this area. The review covered 12 firms of various sizes with assets totalling $140 billion (30% of all mutual fund dealers) and employing 24,650 approved persons (30% of all approved persons).

The review uncovered several problematic practices, including:

- clients over age 70 that were sold funds under DSC arrangements;

[171] Ibid p. 16.

[172] MFDA Bulletin #0670-C, *2015 DSC Sweep Report*, December 18, 2015.

- clients who were sold funds with DSC redemption schedules that are longer than their investment time horizon; and

- evidence of poor disclosure of the redemption fees at certain firms and poor suitability assessment and supervision of sales under the DSC option.

In a recent *MFDA Review of Compensation, Incentives and Conflicts of Interests*, the MFDA identified compensation and incentive practices that increased the risk of mis-selling funds under the DSC option.[173]

Further analysis of *MFDA enforcement files* show that the DSC option can attract dealers/representatives promoting unsuitable leverage strategies on their clients or churning the client accounts.[174] Recommendations that clients borrow to invest in funds on a DSC basis enable the dealer and their representative to increase the total compensation they can earn from the investment. Specifically, they may receive a referral fee from the financial institution in connection with their client's loan in addition to the 5% upfront commission (plus the ongoing trailing commission) they may receive from the investment fund manager on the purchase transaction.

The *Inspections Branch of the AMF* also issued a compliance notice in July 2015 that reported that the AMF found some important risks of non-compliance with the KYC rules among mutual fund dealers in Québec. In particular, certain dealers' compliance systems permitted the sale of funds with DSC redemption schedules to investors with short investment horizons.

These findings suggest that the DSC option remains an attractive option for dealers and their representatives because it offers a guaranteed initial commission of up to 5% of the purchase amount (paid by the investment fund manager rather than the investor), plus the ongoing trailing commission.

The DSC option may have a significant impact for the investor, being the redemption fee payable on investments that are redeemed within a certain number of years of purchase (typically up to 6 years from the date of purchase) where an investor wishes to redeem its investment from the firm. This penalty, which aims to discourage redemptions in order to preserve assets under management, has progressively reduced the popularity of the DSC option with investors.

Recent market data suggests that the use of the DSC option in Canada remains in stark contrast to its very limited use in other jurisdictions. As at the end of 2015, 19% of the Canadian fund assets totalling $234 billion were held in DSC options.[175]The latest data from

[173] MFDA Bulletin #0705-C, *Review of Compensation, Incentives and Conflicts of Interest*, December 15, 2016.

[175] Investor Economics, *Insight Monthly Update*, May 2016. The 19% figure includes DSC (14.4%) and low load (5.1%).

the U.S. and Europe shows that less than 1% of assets in each jurisdiction are invested under the DSC option (0.71% for the U.S. and 0.49% for Europe).[176]

We note that an important Canadian group of mutual funds has announced that it will discontinue the DSC purchase option effective January 1, 2017.[177]

Conflicted advice may negatively affect investor outcomes:

A *study by the Executive Office of the President of the United States*[178] examined the evidence on the cost of conflicted investment advice and its effects on Americans' retirement savings. It found that conflicted advice leads to lower investment returns. Savers receiving conflicted advice earn returns roughly 1 percentage point lower each year (for example, conflicted advice reduces what would be a 6 percent return to a 5 percent return).

A similar *study by John Chalmers et al*[179] examined whether conflicted advice yielded better investment outcomes than no advice. Researchers examined account-level data for participants in a defined contribution plan over time, allowing them to compare the portfolios of advised and non-advised clients with similar attributes over time and to compare advisor recommendations against a simple default option – a target date fund[180]. They found that:

- investors that used the services of a broker earned annual after-fee returns that were 2.98% lower than they would have earned investing in a target date fund - offering similar levels of risk;
- brokers are significantly more likely to place their clients in funds that pay them higher fees.

[179] John Chalmers and Jonathan Reuter, "Is Conflicted Advice Better than No Advice?", NBER Working Paper 18158, (2012), http://www.nber.org/papers/w18158.

[180] A "target date fund", also known as a "lifecycle fund", is designed to provide a simple pre-packaged investment solution through a portfolio whose asset allocation mix becomes more conservative as the target date (usually retirement) approaches. These funds relieve the dealer and their representative from performing any asset allocation and rebalancing for the investor as this occurs automatically within the fund's portfolio as time progresses and the investor nears the target date.

In Canada, a *study by Stephen Foerster et al*[181] analyzing the value of advice by tracking account level data from three mutual fund dealers covering 581,044 investors and 5,920 representatives over a 14 year period reached similar results. Researchers found that:

- representatives encourage increased risk taking among their clients, allocating as much as 30% more to higher risk mutual funds (with higher fees/dealer compensation) than non-advised clients. The higher expected return (i.e. the equity risk premium) that should be generated as a result of greater risk taking is completely nullified by the higher costs borne by clients in high fee mutual funds. For the average investor, it is the representative and mutual funds who capture all of the additional returns from the increased risk taking;

- variation in client attributes tended not to result in a variation in client portfolios. Client portfolios tend to resemble the representative's own portfolio over time, independent of their clients' risk preferences and stage in the life cycle. Investor characteristics including risk tolerance and point in the lifecycle explain only 13% of the variation in risky share across clients; and

- the costs of advice are economically significant given the lack of customization. The average advisor generated a yearly negative alpha of -3.34%, reflecting the average fees borne by the clients each year (nearly 2.7% on average) and the underperformance of the advised portfolio on a before-fees basis, compared to using low-cost passive index funds. Investors' net underperformance therefore equals (or exceeds) the fees that they pay.

Foerster et al. concludes that for the average investor, "investment advice alone does not justify the fees paid to advisors".[182]

Finally, a *study by Daniel Bergstresser et al.*[183] sought to measure the benefits that advised investors enjoy in exchange for the distribution costs they pay. Their research, which studied "broker-sold" and "direct-sold" funds from 1996 to 2004 in the U.S. market, failed to find that brokers deliver substantial tangible benefits. In comparison to investors in direct-sold funds, they found that clients of brokers, on average, purchase funds that deliver lower risk-adjusted returns (on a pre-distribution fee basis) and pay substantial distribution charges, and that the broker channel displays no obvious asset allocation skills that help their investors time the market.

[181] Stephen Foerster, Juhani Linnainmaa, Brian Melzer and Alessandro Previtero, "Retail Financial Advice: Does One Size Fit All?", NBER Working Paper 20712, (2014), http://www.nber.org/papers/w20712.

[182] Ibid, at page.27.

[183] Daniel Bergstresser et. al., supra, note 166.

iii. Embedded commissions encourage high fund costs and inhibit competition by creating a barrier to entry

Certain research finds that price formation in retail financial markets runs counter to classic microeconomic theory telling us that more competition leads to lower prices. This research suggests that the prevalence in Canada of mutual funds with higher fees is largely due to financial product providers relying on intermediaries to distribute their product and paying them incentives to promote their collective profit maximization aims. The pursuit of these mutual goals serves to entrench higher fee arrangements and to curb the growth of less costly alternatives.

Commissions tend to drive up retail prices for financial service products:

A *paper by Mark Armstrong* on the economics of consumer protection states that commissions drive up retail prices for financial service products. The increase in price is "due to competition between firms to offer high sales commissions to have their product promoted, which artificially inflates the marginal cost of selling a product".[184]

Intermediaries are incented to promote high fee arrangements:

Research by Kathryn Judge examining the influence of intermediaries in financial markets finds that the continued prevalence of higher-cost institutional arrangements despite the presence of more efficient alternatives is due to the influence of intermediaries that use positional and informational advantages to promote self-serving high-fee arrangements in order to maximize their revenue. She also finds that intermediary influence has a distorting effect on the allocation of capital as it may cause certain firms to receive more capital than may be warranted. Her research also shows that the intermediary's influence helps to

[184] Mark Armstrong, "Economic Models of Consumer Protection Policies", MPRA/Paper No.34773 (16 November 2011), p.14, https://mpra.ub.uni-muenchen.de/34773/1/MPRA_paper_34773.pdf. At pages 15 and 16, Armstrong goes on to state:

> "This section has described a model where firms attempt to influence a salesman's marketing efforts by means of per-sale commission payments. The salesman gives prominence to the product which pays the highest commission, and in equilibrium this entails steering uninformed consumers toward the more expensive products. Competition between sellers to set the highest commission means that the marginal cost of supply is inflated and equilibrium retail prices are high. Therefore, the outcome for consumers, both informed and uninformed, is poor: worse than the situation without commission payments where the uninformed shop randomly, and far worse than the situation in which consumers pay directly for advice. This model therefore gives some support to consumer policies which restrict the use of commission payments as a marketing tactic."

explain an array of observable trends such as the growth and increasing complexity of the financial sector.[185]

Pricing complexity and incentive contracts tend to maintain high prices in retail financial markets, even as more firms enter:

Research by Bruce Ian Carlin examining pricing in retail financial markets finds that, despite the large number of firms in the market, prices remain above marginal cost and may even rise as more firms enter. He finds that these anomalies arise when product providers (i) add complexity to their price structures which affects consumer literacy about prices, thereby preserving market power and corporate profits, and (ii) align themselves with the advice channel and sign incentive contracts that are mutually profitable. These incentive contracts make it more profitable for the advice channel to hold back information from consumers and preserve industry profits.[186]

The findings from the above research may offer an explanation for why the embedded dealer compensation model remains predominant in Canada, despite the availability of alternatives, and why high fund fees continue to persist in Canada.

Mutual fund fees in Canada are consistently among the highest in the world:

The persistence of high fund fees in Canada has been observed by a number of research studies published over the last 13 years which, when comparing mutual fund ownership costs globally, consistently conclude that Canadian mutual fund fees are among the highest in the world.[187]

---

[185] Kathryn Judge, "Intermediary Influence", *University of Chicago Law Review*, Vol. 82, Issue 2, Article 1, (2015), pp. 573-642, http://chicagounbound.uchicago.edu/cgi/viewcontent.cgi?article=5853&context=uclrev. At page 629, Judge states:

> "Intermediary influence may also distort the allocation of capital in systematic ways. When intermediaries earn greater fees from particular types of transactions, they tend to use their influence to favor that transaction type. The greater the influence an intermediary enjoys, the greater the resultant distortion in the mix of transactions actually consummated, that is, the greater the fee effects. Thus, when intermediary influence results in institutional arrangements that make parties more reliant on a particular type of intermediary, greater fee effects generally result. And, when certain firm types or sectors of the economy receive capital through pathways that are particularly profitable for financial intermediaries, greater fee effects result in greater capital being allocated to those firms and sectors than is socially optimal. At the extreme, asset bubbles can result. A closely related effect is that when firms or sectors are funded in ways that are less profitable for intermediaries, those firms or sectors may receive less capital than is socially optimal."

[187] Examples of such studies include: B.N. Alpert et al., "Morningstar Global Fund Investor Experience Study (June 2015); B.N. Alpert et al., "Morningstar Global Fund Investor Experience", 2013 Report; B.N. Alpert et al., "Morningstar Global Fund Investor Experience 2011" (March 2011); J. Rekenthaler et. al., "Morningstar Global

In response to these studies, a *study by Investor Economics and Strategic Insight for The Investment Fund Institute of Canada*[188] proposed an analytical framework[189] to enable comparisons of the total cost of mutual fund ownership by mutual fund investors in the United States and Canada as well as other countries. The framework identifies and highlights the impact of structural differences between the U.S. and Canadian mutual fund industries, including differences in taxation of management fees, economies of scale in mutual fund distribution and investment management, and the manner in which advisory fees are charged, as being among the factors that combine to explain the differences in the level of the cost of ownership of funds in the two countries and make it difficult to make detailed comparisons between the two jurisdictions. Beyond these differences, the study suggests that the cost of ownership of funds in advised relationships in Canada – both commissions and fee-based – is at a comparable level to the average cost of ownership incurred by a typical fee-based investor in the U.S. On a tax-adjusted basis, through the elimination of the impact of Canadian taxes on management fees, the asset-weighted cost of ownership in Canadian advice channels is estimated to be 2.02% of invested assets compared to the level of approximately 2% in the U.S.

According to recent *Investor Economics* data, the average asset-weighted fund industry MER for long term funds has fallen from 2.01% in 2004 down to 1.95% in 2015.[190] Management fee reductions by several investment fund managers are responsible for the bulk of the six basis point MER decline during this period.

Fund Investor Experience 2009 (May 2009); A. Khorana et al., "Mutual Fund Fees Around the World" (July 23, 2007); and K. Ruckman, "Expense Ratios of North American Mutual Funds", *Canadian Journal of Economics* (February 2003) p. 192-223.

[188] Investor Economics and Strategic Insight, "Monitoring Trends in Mutual Fund Cost of Ownership and Expense Ratios, A Canada – U.S. Perspective", November 2012, a study for The Investment Funds Institute of Canada. This study was subsequently updated in: Investor Economics and Strategic Insight, "Monitoring Trends in Mutual Fund Cost of Ownership and Expense Ratios: A Canada – U.S. Perspective, 2015 Update", May 2015 Update to the 2012 study by Investor Economics and Strategic Insight For The Investment Funds Institute of Canada.

[189] These findings are based on the assumption that investment choices (i.e. the usage of actively managed mutual funds) remain the same whether the advisor uses a fee-based or commission-based arrangement and reflect the fact that large low-cost fund providers in the U.S. were not included in the cost comparisons. The total cost of ownership in the U.S. would otherwise be lower if this assumption was relaxed and if the sample were changed. In addition, as highlighted by Investor Economics at page 17 of their separate report on the Canadian fund market (Investor Economics, *Mutual Fund MERs and Cost to Customer in Canada: Measurement, Trends and Changing Perspectives*, September 2012), the total cost of ownership in Canada would be lower if the switch to fee-based compensation led to higher usage of ETFs and index funds.

[190] Investor Economics, *Investor Economics Insight*, July 2016. Investor Economics looks at the average asset-weighted fund industry MER for long term funds which excludes money market funds, funds with performance fees, funds with management fees charged at the account level and labor-sponsored funds.

Low availability of low-cost passively-managed index funds in Canada:

Passively-managed index mutual funds in Canada typically:

- bear a substantially *lower management fee* – usually no more than 0.50% compared to the more typical 1.5 to 2% charged on actively managed equity funds; and
- pay a substantially *lower trailing commission* to dealers – usually between 0.10% and 0.25%, compared to the more typical 1% trailing commission paid on actively managed equity funds.

The lower cost of passively managed index mutual funds suggests that these funds are substantially less profitable for both investment fund managers and dealers, which in turn reduces the incentive to manufacture and distribute these lower-cost products.[191]

At June 2015, low-cost passively-managed mutual funds (excluding ETFs) in Canada made up only 1.5% of mutual fund total assets under management - a level that has remained essentially unchanged over the last 10 years - while the remaining 98.5% of mutual fund assets is actively managed. By comparison, passively-managed mutual funds comprise 15.3% of the U.S. market and 11.2% of the U.K. market.[192]

The low availability of low-cost passively managed mutual funds persists in Canada despite the volume of research finding that most actively-managed funds generally tend to not perform sufficiently well to justify their higher fees[193] and tend to underperform their passive counterparts on a net of fees basis.[194]

---

They find "that few active funds produce benchmark adjusted expected returns that cover their costs," indicating that "if many managers have sufficient skill to cover costs, they are hidden by the mass of managers with insufficient skill."); Mark Carhart, "On Persistence in Mutual Fund Performance", *Journal of Finance*, Vol. 52, (1997) pp. 57-82 (at p.80 finding that "[a]lthough the top decile mutual funds earn back their investment costs, most funds underperform by about the magnitude of their investment expenses. The bottom-decile funds, however, underperform by about twice their reported investment costs."); Martin J. Gruber, "Another puzzle: The growth of actively managed mutual funds", *Journal of Finance*, Vol. 51, (1996), pp. 783-810 (at page 789 finding that actively managed "mutual funds underperform an appropriately weighted average of the indices by about 65 basis points per year" because even though "active management adds value, . . . mutual funds charge the investors more than the value added"). We note however certain research finding that some actively managed mutual funds perform sufficiently well to justify the associated fees, but such funds are the minority and they do not perform sufficiently well to justify the average actively managed fund. For example, Malcolm Baker et al., "Can Mutual Fund Managers Pick Stocks? Evidence from Their Trades Prior to Earnings Announcements", *Journal of Financial and Quantitative Analysis*, Vol. 45, (2010) pp. 1111-1131, (at p. 1119 finding that "the average mutual fund . . . does not appear to possess stock picking ability," but that some funds do outperform the market); Robert

A similar trend may generally be observed with ETFs. Most Canadian ETFs are passively managed (86.2%) and typically do not pay embedded commissions.[195] Most ETFs bear lower management fees – 88.3% of Canadian ETFs pay management fees of less than 0.75%. However, ETF assets under management have increased significantly over the last few years. As at June 2016, ETFs made up 7.3% of investment fund total assets under management. By comparison, ETFs represented a total of 11.6% of the U.S. investment company total assets.[196]

Countries with low levels of index funds may experience poor price competition:

A recent *study by Martijn Cremers et al*[197] suggests that countries with low levels of explicitly indexed funds (i.e. passive index tracking investment funds that are advertised as

Kosowski et al., "Can Mutual Fund "Stars" Really Pick Stocks? New Evidence from the Bootstrap Analysis", *Journal of Finance*, Vol. 61, (2006), pp. 2551-2595 (at p. 2553 finding that "while most funds cannot compensate for their expenses and trade costs, a subgroup of funds exhibit stock-picking skills that more than compensate for such costs").

[194] Morningstar Canada Research, "Have Active Canadian Equity Fund Managers Earned Their Keep?", May 7, 2015 (finding that fund fees gobble up most of Canadian equity funds' excess returns: Just 18% of funds in the category outperformed the passive alternative on a net-of-fees basis over the 10-year period); Morningstar Manager Research, "Morningstar's Active/Passive Barometer: A new yardstick for an old debate", June 2015 (finding that U.S. actively managed funds have generally underperformed their passive counterparts, especially over longer time horizons and experienced mortality rates (i.e. many merged or closed). In addition, the report finds that failure tended to be positively correlated with fees (i.e. higher cost funds were more likely to underperform or be shuttered or merged away and lower-cost funds were likelier to survive and enjoyed greater odds of success) and that fees matter as they are one of the only reliable predictors of success.); Vanguard Research by Christopher B. Philips et al., "The Case for Index-Fund investing for Canadian Investors", April 2015 (finding that low-cost index funds have displayed a greater probability of outperforming higher-cost actively managed funds, even though index funds generally underperform their targeted benchmarks); Richard A. Ferri and Alex C. Benke, "A Case for Index Fund Portfolios: Investors holding only index funds have a better chance for success", June 2013 (finding that diversified portfolios of index funds consistently outperform portfolios of actively managed funds – specifically, when comparing a ten-fund index fund portfolio to a portfolio consisting of ten randomly selected actively managed funds using identical asset class categories and weightings, the ten-fund index fund portfolio beat actively managed portfolios 90% of the time over a 10 year period running from 2003 to 2012).

[195] There are currently 93 ETFs that offer advisor class shares for which the investment fund manager will pay an ongoing commission (usually called "service fee") to the dealers. These ETFs represent less than 1% of Canadian ETF assets under management.

[196] Based on data from Investor Economics and the 2016 Investment Company Fact Book, 56th edition, Investment Company Institute, https://www.ici.org/pdf/2016_factbook.pdf.

[197] Martijn Cremers, Miguel A. Ferreira, Pedro P. Matos and Laura T. Starks, "Indexing and Active Fund Management: International Evidence", *Journal of Financial Economics, Forthcoming*; Darden Business School Working Paper No. 2558724, (February 1, 2015). Available on SSRN: http://papers.ssrn.com/sol3/papers.cfm?abstract_id=2558724.

such) experience poor price competition and thus higher fees. The study examined the relation between indexing and active management in the mutual fund industry worldwide. They found that actively managed funds are more active and charge lower fees when they face competitive pressure from low-cost explicitly indexed funds. Moreover, the average alpha generated by active management is higher in countries with more explicit indexing and lower in countries with more closet indexing.[198] Overall, the evidence from the study suggests that explicit indexing improves competition in the mutual fund industry. Canada was found to have low levels of explicit indexing with explicit indexing ETFs and mutual funds collectively making up only 7% of the market.

'Direct-to-client' funds may have difficulty competing on an equal basis in Canada:

Lower-cost mutual funds that are sold under the 'direct-to-client' model[199] (i.e. without the intermediation of a third party dealer) and that do not pay any dealer compensation make up only 2.8% of assets under management in Canada. Assets in the 'direct-to-client' channel have remained flat, with no increase in market share over the last several years.[200] The investment fund managers of these funds must rely strictly on the performance and attributes of their product to attract sales rather than the payment of compensation to dealers.

New low-cost providers may have difficulty entering the Canadian market:

The slow growth of the 'direct-to-client' model in Canada may have discouraged new low-cost providers from entering the market in Canada. Specifically, when Vanguard, one of the largest U.S. 'direct-to-client' mutual fund and ETF manufacturers, entered the Canadian fund market in 2011, it did so with its ETFs only, and not with its 'no trailing commission' mutual funds that are widely distributed in the U.S. Vanguard Investments Canada stated that the barrier to entry in Canada was the requirement to pay for distribution.[201] This

[198] "closet indexing" refers to an investment fund that purports to be actively managed but actually follows more or less a benchmark index.

[199] There exist only a handful of Canadian fund companies that sell directly to the public. In those cases, the investment fund manager or a related party is registered as a mutual fund dealer and sells its funds directly to the public.

[201] See transcript of OSC Roundtable Re Discussion Paper and Request for Comment 81-407 Mutual Fund Fees (June 7, 2013) , supra, note 2, at p.98 - Question from Commissioner Deborah Leckman to Atul Tiwari, Managing Director/Head of Canada for Vanguard Investments:

> "COMMISSIONER LECKMAN: So I have a final question for Atul, and then maybe there will be some more questions from either the panelists or from the audience. You came into Canada and chose only to use ETFs. What was the business reason you chose not to offer your conventional mutual funds that don't pay trailers in Canada?
>
> MR. TIWARI: Good question. Well, Vanguard actually looked at coming into Canada for well over 20 years; I'm told this was the seventh business plan that had been put together. We are a pretty prudent and

statement suggests that the payment of trailing commissions may essentially be the 'price of admission' to the Canadian market and that low-cost investment fund providers that do not pay any or low trailing commissions may not be able to access major fund distribution channels. This barrier to entry inhibits effective price competition in our market.

Issue 2: Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

i. The lack of saliency of embedded commissions reduces investors' awareness of dealer compensation costs

Investors tend to understand 'visible' fees the most:

A *report by the Brondesbury Group on performance reporting and cost disclosure*[202] found that:

- The fees that investors understand the most appear to be those that are most visible, such as transaction-based commissions and account fees, which were understood by two-thirds of investors who participated in the study;
- only 4 out of 10 respondents indicated they understood DSCs;
- only one-third of respondents indicated they understood trailing commissions; and
- only half of respondents reported that they discussed costs with their advisor.

Investors are generally more apt to attempt to control salient fees:

A *study by Brad Barber et al.*[203] found that investors are less apt to control the impact of fees paid from fund assets. It found that mutual fund investors are more sensitive to salient, upfront fees, like front-end loads and direct commissions, than a fund's operating expenses. This study analyzes U.S. mutual fund flows over a period of 30 years and, when assessing how investors respond to expenses while investing in mutual funds, finds that investors treat

deliberate organization, to say the least. The original barriers all had to do with paying for distribution. Again, Vanguard doesn't pay for distribution. So when you look at the structure of the market in Canada, it would be a tough slog to kind of come in and have a business proposition that's based around trying to sell mutual funds without a trailer."

[202] The Brondesbury Group, "Report: Performance Reporting and Cost Disclosure", prepared for: Canadian Securities Administrators (September 17, 2010), at p.15-16, http://www.osc.gov.on.ca/documents/en/Securities-Category3/rpt_20110622_31-103_perfomance-rpt-cost-disclosure.pdf.

[203] Brad M. Barber et al., "Out of Sight, Out of Mind: The Effects of Expenses on Mutual Fund Flows", *The Journal of Business*, Vol. 78, no 6 (2005), pp. 2095-2120, http://faculty.haas.berkeley.edu/odean/papers%20current%20versions/Out%20of%20Signt.pdf

front-end loads and fund expenses differently. It finds a negative relation between flows and front-end loads, but finds no relation between operating expenses and flows. This research suggests that investors are more apt to attempt to control visible fees which they must pay directly, but remain passive about ongoing fund fees paid out of fund assets.

Canadian investors are generally not aware of what they pay for financial advice or that they pay for financial advice at all:

The fund industry's latest *Pollara opinion survey*[204] found that only:

- 27% of investors could say they "definitely" believe that part of the fees charged within mutual funds are used to compensate their financial advisor, while 45% replied "I think so". Another 21% do not believe they pay for financial advice through embedded fees, while the remaining 10% indicated they "don't know";

- 56% of investors recalled that their advisor discussed his/her compensation when they last purchased a mutual fund;

- 62% of investors recalled that their advisor discussed mutual fund fees such as front-end sales charges and DSCs; and

- 57% of investors recalled that their advisor discussed MERs;

A *BCSC National Smarter Investor Study*[205] finds that 23% of Canadians do not know how their advisor is paid. Over half (53%) do not know how much they paid to their advisor in the last 12 months;

The *OSC Mystery Shop report*[206] found that while 56% of the investors were told about fees for products, just 25% were told about how the advisor would be compensated;

A *study by PMG Intelligence*[207] found that:

- investors are confused about fees (whether they are disclosed or not, whether they pay them or not, whether they are discussed or not); and

- most investors aren't sure how much they pay for advice and what fees they pay for

[204] POLLARA Inc., "Canadian Investors' Perceptions of Mutual Funds and the Mutual Fund Industry" (2016), Report Prepared For: The Investment Funds Institute of Canada, https://www.ific.ca/wp-content/uploads/2016/09/IFIC-Pollara-Investor-Survey-September-2016.pdf/15057/.

but acknowledge some form of disclosure;

A recent *survey by Tangerine Investments*[208] found that:

- although the majority of investors surveyed (89%) describe themselves as either "very knowledgeable" or "somewhat knowledgeable" when it comes to their investments, many were unaware of the associated fees – 36% of those surveyed claimed they do not pay any fees, and another 11% were unsure if they pay fees at all;

- when the survey narrowed in on the 67% of investors who use a financial advisor, 24% of those surveyed said they do not pay fees or commissions for their advisor's services, and another 13% were unsure; and

- of those who were aware of fees for their advisor's services, when asked how well they understood the fee structure, nearly 40% said "not very well" or "not at all".

A *report by the Brondesbury Group on advisor relationships and investor decision-making*[209] found that investors have minimal knowledge of mutual fund fees and what affects them, including how their advisors can get paid. Specifically, they found that:

- unless investors are told what affects the amount of fees they pay, they are unlikely to reach an accurate conclusion on their own. Even when the full range of fees and what affects them are identified, it is difficult for investors to assess the implications of what they have learned;

- only one third of investors were able to recognize several common compensation arrangements and one-third indicated they were aware of trailing commissions; and

- out of the one-third who indicated they were aware of trailing commissions, about 4 out of 10 respondents agreed that the amounts of these commissions may vary depending on the type of mutual fund and the mutual fund manufacturer that offers the fund.

This same study assessed respondents' knowledge about how advisors were paid by presenting them with five statements to agree or disagree with. The percentage agreement

[208] Tangerine Investments conducted an online survey from June 29 to July 4, 2016 among 1,003 randomly selected Canadian adults. The results are discussed here: http://www.newswire.ca/news-releases/many-canadian-investors-unaware-of-fees-theyre-paying-to-invest-586603691.html.

[209] The Brondesbury Group, "Investor behavior and beliefs: Advisor relationships and investor decision-making study", a report prepared for the Investor Education Fund, 2012, http://getsmarteraboutmoney.ca/en/research/Our-research/Documents/2012%20IEF%20Adviser%20relationships%20and%20investor%20decision-making%20study%20FINAL.pdf.

was so similar across all five statements that the authors concluded that "the results demonstrate that investors have little or no idea about how advisors can get paid."[210]

Costs do not figure significantly into investor-decision making:

According to the same *report by the Brondesbury Group on advisor relationships and investor decision-making*[211], costs do not figure significantly into investor decision-making due largely to investors' lack of awareness and/or understanding of fund fees, as highlighted above. The cost of buying is a factor for only 2 out of 10 investors, but almost never a decisive factor. Management fees are treated similarly. Costs may deter 1 out of 6 of buying.

This study also found that most investors do not consider information in fund disclosure documents to make their investment decision, preferring instead to rely on their advisor for their investment decision. For 8 out of 10 investors, the advisor's opinion dominates all other sources as a factor in buying decisions. Investors trust their advisor to provide advice that benefits the client first.

ii. Embedded commissions add complexity to fund fees which inhibit investor understanding of such costs

Embedded dealer compensation results in numerous fund series that adds complexity to fund fees:

The fund fee structure has grown increasingly complex over the last several years due to the growing number of fund series on offer, with each series having different fees. The numerous fund series available today on most funds has effectively resulted in an '*alphabet soup*' of fund series[212] that can be confusing to investors and overwhelm their ability to understand the fees that apply to their investment.

Mutual funds typically offer various series of their securities which may be designed for:

ii. specific types of dealer business models and the investors they serve (for example, retail, higher-net-worth, institutional, fee-based, DIY/discount brokerage), or

iii. a specific purpose (for example, hedged series or 'tax-advantaged' series paying fixed distributions that include a portion of return of capital).

---

[210] Ibid. page 25.

[211] Ibid.

[212] The following news articles acknowledge the complexity of the Canadian mutual fund series "alphabet soup". See John Heinzl, "What do all those letters mean after mutual fund names?", *Globe and Mail*, August 16, 2013, http://www.theglobeandmail.com/globe-investor/funds-and-etfs/funds/what-the-f-the-abcs-of-mutual-funds/article13816786/; Bryan Borzykowski, "Decoding the mutual fund alphabet soup", *Money Sense*, August 16, 2012, http://www.moneysense.ca/save/investing/mutual-funds/decoding-the-mutual-fund-alphabet-soup/.

Some Canadian investment fund managers may offer in excess of 30 different series of their funds. Each series is denoted with a different letter, but there is no official standard governing how investment fund managers use letter designations for their fund series. Each series may:

- have different eligibility requirements (e.g. specified investment thresholds);
- have different management fees (typically, the higher the investment threshold, the lower the management fee);
- be sold under various sales charge options (front-end load, low-load, DSC, fee-based, no-load); and
- pay different compensation (trailing commissions and other embedded sales commissions) to the dealer.

As at the end of June 2016, taking into account underlying purchase options, there were 39,848 unique mutual fund series/purchase option combinations available in Canada[213] in which were invested a total of $1.3 trillion[214].

Further adding complexity is the fact that trailing commissions payable on various fund series may vary based on:

- the investment fund manager – they may differ between similar funds and fund series managed by different investment fund managers, i.e. some investment fund managers may pay more/less than others;
- the asset class of the fund - they are typically highest on equity funds, lower on fixed income funds and lowest on money market funds;
- the main investment strategy – they are typically higher for actively managed funds and lower for passively managed funds;
- the purchase option selected - they are typically higher on fund investments made under the front-end load and low-load options and lower on fund investments made under the DSC option; and

[213] Source: FundSERV – mutual fund and wrap products. By contrast, there were 32,555 unique mutual fund series/purchase option combinations available in the United States (source: Morningstar Direct) at the end of June 2016 in which were invested a total of $15.9 trillion USD (source: Investment Company Institute).

[214] Source: Investor Economics.

- the length of time the investment is held - for example, they may:
  - in some cases increase in steps with each year the investor continues to hold the investment, reaching a specified maximum after a certain number of years; or
  - where the investment has been made under the DSC option, double at the expiration of the redemption schedule (6 years on average).

The wrong choice of fund series may subject an investor to excess fund fees:

The complexity of fund fees created by the plethora of series on offer requires dealers to maintain robust systems of controls and supervision to ensure that investors are being invested in the fund series that is right for them. The failure to have such systems can result in investors holding the wrong fund series securities and paying excess fees as a result. In *recent no-contest settlements*[215], OSC staff alleged that certain dealers had inadequacies in their systems of controls and supervision which formed part of their compliance systems which caused clients to not be invested or switched into a lower-fee series of a fund for which they were eligible (further to having met the minimum investment threshold for investment in the series). OSC staff further alleged that these inadequacies resulted in clients paying excess fund management fees. These settlements were concluded after the dealers self-reported to the OSC. As part of the settlement agreements, the dealers undertook to pay compensation to affected clients and former clients.

Disclosure generally does not help investors identify the best fund series based on compensation:

The *Brondesbury Group Mutual Fund Fees Research*[216] finds that:

- most investors are unable to understand and assess different forms of compensation. They cannot make the economic assessment due to the complexity of calculations and the difficulty of choosing the right underlying assumptions, nor can they assess the implications of compensation arrangements for creating potential conflicts of interest in the advice that advisors give them; and
- in a commission-based environment, disclosure does not help investors identify either the best advisor or the best fund series based on compensation. The end result

[215] See the no-contest settlements in the matters of *TD Waterhouse Private Investment Counsel Inc.* (http://www.osc.gov.on.ca/documents/en/Proceedings-SET/set_20141113_td-waterhouse-private-investment.pdf), *Quadrus Investment Services Ltd.* (http://www.osc.gov.on.ca/documents/en/Proceedings-SET/set_20151106_quadrus.pdf), *Scotia Capital Inc.* (http://www.osc.gov.on.ca/documents/en/Proceedings-SET/set_20160725_scotia-capital.pdf), *CIBC World Markets Inc.* (http://www.osc.gov.on.ca/documents/en/Proceedings-SET/set_20161024_cibc.pdf) and *BMO Nesbitt Burns Inc.* (http://www.osc.gov.on.ca/documents/en/Proceedings-SET/set_20161209_bmo.pdf).

[216] The Brondesbury Group, supra, note 3, at pages 46 to 48.

is that the advisor will propose the fund series and it will be advantageous to them.

The complexity of fund fees may discourage investors from asking about dealer compensation – investors trust the compensation is fair and reasonable:

The *BCSC National Smarter Investor Study*[217] finds that:

- the complexity of fund fees is intimidating to investors and discourages investors from asking about their dealer/representative's compensation. Specifically, the study finds that 23% of Canadians have never asked their advisor what fees they pay. Of these individuals, 37% agreed that they would ask about compensation more often if they had a better understanding of how fees and commissions for advisors worked;

- for Canadians who invest with an advisor but say they do not always ask about compensation, trust was the key reason they do not ask more often – 72% indicated that they trust that their advisor's compensation is fair and reasonable.

Complexity in fund pricing can increase investors' reliance on dealer/representative's advice:

Research by Kathryn Judge suggests that complexity in financial products is deliberate to ensure investors' reliance on intermediaries for investment decisions and assure intermediaries' long-term returns. She states that: "[G]reater complexity can make an investor more reliant on an intermediary's guidance and other services. This increases the probability that the investor will continue to use that intermediary's services in the future, increasing the intermediary's long-term expected returns. Complexity can also make it more difficult for any of the parties involved to see the full range of fees an intermediary is earning on a transaction. To the extent that salience affects a party's inclination to push for a lower fee, intermediaries may prefer less transparent, and hence more complex, transactions and market structures." [218]

Retail financial product providers may strategically use price complexity to limit awareness of fees:

Research by Bruce Ian Carlin[219] suggests that product providers in retail financial markets strategically add price complexity to their product to maintain consumer ignorance about prices, which in turn preserves the provider's ability to gain market power and earn corporate profits. This complexity ultimately leads to failure of competition, despite the large number of firms in retail financial markets. He finds that: "increased competition always leads to higher industry complexity. When more firms compete for market share,

[217] BC Securities Commission, supra, note 152.

[218] Kathryn Judge, supra note 185 at page 627.

[219] Bruce Ian Carlin, supra note 186 at page 4.

the probability that they receive demand from the informed consumers decreases. To maximize expected profits, the firms tend to increase complexity in order to optimize the revenues they receive from uninformed consumers. Increased complexity and higher cognitive load makes it harder for consumers to become informed. If a larger fraction of consumers remain uninformed when more firms are present, then prices rise."

iii. The product embedded nature of dealer compensation restricts investors' ability to directly control that cost and its effect on investment outcomes

Dealer compensation charged at the fund level may cause cross-subsidization:

Embedding dealer compensation costs into fund management fees charged to a mutual fund rather than charging and collecting such compensation at the account level can cause some investors to subsidize the cost of certain commissions or other services that are not attributable to their specific investment in the fund. This cross-subsidization of dealer compensation costs can result in some investors indirectly paying excessive fees beyond their control.

One example of such cross-subsidization is the subsidization by front-end load investors of the specific distribution costs attributable to DSC investors. Specifically, investment fund managers may use part of the management fees they earn on a fund to fund the payment of upfront sales commissions to dealers on sales made under the DSC option.[220] The cost of these embedded sales commissions is allocated to the fund as a whole, and therefore to all investors in the fund, irrespective of the purchase option under which they made their fund investment. As a result, even though these costs are unique to the DSC option, investors who purchase under the front-end load option (under which the investor may have already paid a sales charge directly to their dealer or representative at the time of purchase) bear the same 'higher' management fee as, and therefore subsidize, those investors who purchase under the DSC option.

Less than a handful of Canadian investment fund managers have addressed this type of cross-subsidization by offering a different series or class of their funds for each of the various purchase options, with each bearing a different management fee reflecting the different costs associated with the different purchase options. In these cases, the management fee of the front-end load series is typically 15 basis points lower than the management fee of the DSC series.

We note that in the U.S., mutual funds offer separate classes of securities for each purchase option. The A share class is the front-end load purchase option and the B share class is the DSC purchase option. The B share class expenses are typically 0.60 to 0.75 percent higher each year than on class A shares.[221]

[220] See note 6 for a description of the DSC option.

[221] The difference in expenses is observable by reviewing fee disclosure in U.S. mutual fund prospectuses. See also FINRA Investor Alert: "Class B Mutual Fund Shares: Do They Make the Grade?", http://www.finra.org/investors/alerts/class-b-mutual-fund-shares-do-they-make-grade.

Discount/DIY series not widely available:

Some investment fund managers offer a discount series (e.g. series D) of their funds for DIY investors whose lower management fees reflect a reduced embedded trailing commission of typically no more than 0.25%. However, those investment fund managers that do offer a discount series typically offer it on only a portion of their fund lineup rather than all their funds[222]and their accessibility is limited. Discount series are typically available only online through certain discount dealers. Industry data shows that:

- only 1% of Canadian mutual fund assets is held in a discount/DIY series;[223]and
- the bulk (roughly 84%)[224] of mutual fund assets held in the online/discount brokerage channel remain invested in the regular retail fund series paying full unreduced trailing commissions to the discount broker.

Fee-based option not a true choice for everyone:

Many investment fund managers offer a fee-based series (e.g. series F) for investors in fee-based arrangements with their dealer/representative whose reduced management fees reflect the absence of embedded trailing commissions. Instead, the investor pays the dealer directly for advisory services rendered in connection with their account.

While most investment fund managers offer a fee-based series of their funds which have relatively low investment minimums, not every investor can access this series because:

- dealers often impose significant account size requirements ($250,000+) that must be met in order for investors to be eligible to participate in a fee-based program; and

- not all dealers/representatives work under a fee-based model. Many dealers/representatives (particularly in the MFDA channel) operate on a commission-only basis which means that they do not offer the fee-based series to their clients. Only the fund series with embedded compensation is placed on their product shelf.

[222] At February 2016, there were 17 investment fund managers offering at least one discount/DIY fund series on a total of 439 funds. Source: Morningstar Direct, SEDAR at February 2016.

[223] As at September 2015, assets in discount/DIY mutual fund series totaled $12.053 billion, up from $11 billion in December 2011, although not all of this was held in the online/discount brokerage channel. The $12 billion figure includes an estimated $4.6 billion in series D mutual fund assets held in the online/discount brokerage channel, as well as other similar discount/DIY series sold directly by the investment fund manager. Source: Investor Economics.

[224]As at September 2015, a total of $29.585 billion in mutual fund assets was held in the online/discount brokerage channel. Investor Economics estimated that only $4.6 billion in discount/DIY fund series assets was actually held in the online/discount brokerage channel. This suggests that $25 billion of the total $29.585 billion of mutual fund assets in the online/discount brokerage channel remains invested in the regular retail fund series paying full trailing commissions. Source: Investor Economics.

Fee-based fund series made up only $40 billion or 4% of fund industry assets at the end of 2013. While fee-based assets increased significantly over the five years ending 2015, increasing by 248% over that period, fee-based options still only made up $69 billion or 6% of fund industry assets at the end of 2015.[225]

Direct-to-client funds not widely available:

As explained above, only a few investment fund managers in Canada offer lower-cost mutual funds under the 'direct-to-client' model. These mutual funds charge lower management fees reflecting the absence of embedded trailing commissions. These mutual funds typically have minimum investment thresholds of $10,000 of more, which means that they may not be within reach of many retail investors. Mutual funds sold under the 'direct-to-client' model make up only 2.8% of assets under management in Canada.[226]

The lack of availability and/or accessibility of the above options for many Canadian investors allows embedded commissions to prevail and ultimately limits investors' ability to control the impact of these fees on their investment outcomes.

Issue 3: Embedded commissions paid do not align with the services provided to investors

i. Investors do not receive ongoing advice commensurate with the ongoing trailing commissions paid

No rules requiring specified ongoing services:

The fund facts document for mutual funds typically states that trailing commissions are for the services and advice the dealer and its representative provide to the investor.

However, there is currently no securities regulation that prescribes, or guidance that articulates, the specific services that an advisor is expected to provide in exchange for ongoing trailing commissions. Under NI 31-103 – *Registration Requirements, Exemptions and Ongoing Registrant Obligations* (**NI 31-103**), dealers/representatives are required to provide certain services at the time of the trade (e.g. suitability, know-your-client), but no requirement to provide ongoing advice focused on the client's portfolio.

Trailing commission payments are largely used to support dealer operations and sales activity:

The various comment letters submitted by fund industry participants in response to the Original Consultation Paper indicate that trailing commissions are largely used to support dealer operations and to compensate the advisor for work done at the time of the original

[226] See notes 199 and 200 above and related discussion under Issue #1.

investment, rather than for ongoing advice provided over the term of the investment.

IFIC's response letter dated April 12, 2013, states that the bulk of trailing commission payments are used to support dealer operations. At page 3 of their letter, IFIC states:

> *"The first misconception is found in the Discussion Paper's underlying theme that trailing commissions are used exclusively for the compensation of advisors. The reality is that trailing commissions are paid to the dealer firm to cover a whole host of regulatory and supervisory functions and services in addition to advisor compensation. The dealer may retain one half or more of the trailing commission to pay for, for example: tier 1 and tier 2 supervision and the systems that support it, regulatory costs including fees to fund the SROs, OBSI, and securities commissions, client complaint handling processes, advisor investigation and enforcement requirements, general compliance obligations of the SROs, OBSI, and securities commissions, client reporting, due diligence on products, etc."*

The letter dated April 12, 2013 from the *Investment Industry Association of Canada* (**IIAC**) similarly indicates that trailing commissions are used to cover the cost of a host of services other than the provision of investment advice, many of which may be provided equally by execution only and full-service dealers. At page 5 of their letter, IIAC states:

> *"The following is a list of some services supported by trailing commissions that are provided by investment dealers on an ongoing basis (many apply equally to execution only and full-service dealers):*
>
> - *Printing and mailing of disclosure documents (prospectuses, Fund Facts, other shareholder communications, including proxy material);*
> - *Processing of corporate events and distributions (Since mutual funds held by investment dealers are typically registered in nominee name, the dealer takes on responsibility for updating client account records for things such as mutual fund reorganizations and client payments of interest, dividends, etc.);*
> - *Preparation and distribution of tax reporting information such as annual trading summaries, and, in some cases, T3 and T5013 tax slips;*
> - *Provide the widest selection of mutual funds from multiple fund families (This requires efforts by the dealer/advisor to conduct extensive product due diligence and legal documentation before making these funds available to clients.);*
> - *Custody services;*
> - *Portfolio monitoring of margin requirements;*
> - *Clearing and settlement of purchase and sales through FundSERV and/or CDS.*
>
> *The services above should be taken into consideration with respect to the importance of trailers to advisors and their firms."*

The letter dated April 12, 2013 from *Investors Group* states that trailing commissions pay for distribution and a variety of dealer costs, and not just the provision of ongoing services by dealers and their representatives. At page 4 of their letter, Investors Group states:

> *"This proposal [to tie trailing commissions to the provision of specific services by advisors] arises from a misunderstanding that 100% of trailing commissions are paid for ongoing services provided by advisors. In fact, the compensation is paid to the dealer in connection with the distribution of the financial products and is generally the only source of revenue for mutual fund dealers. This revenue pays for a variety of dealer costs, including supervision, back office functions, client statement production, insurance and similar expenses – many of which, we note, have increased as a result of recent regulatory requirements – in addition to the cost of compensating advisors. The dealer, not the manufacturer, determines the level of service its advisors are to provide.*
>
> *Of the industry average of two-thirds of the trailing commission actually paid to advisors by the dealer, there are two facets involved. First, they represent deferred compensation to advisors for the initial work done by them in providing advice to clients at the time of the original investment. Second, these payments are to compensate for the ongoing service provided by the advisor to the client. Because of this, the services provided by advisors to investors will vary depending on a number of factors, including the size of the portfolio and specific needs of the particular client including desired frequency of contact and updates."*

An *IFIC paper*[227] notes that, on average, 0.78% of the assets invested in a long-term fund are paid annually by the fund to the dealer, of which approximately two-thirds may go to the representative for advisory services and the rest kept by the dealer to pay for administrative, compliance and regulatory oversight functions.

Varying trailing commissions between different investment fund managers, fund types and purchase options:

As explained above, trailing commissions may vary between different investment fund managers and will generally further vary based on the asset class of the fund and the purchase option selected.[228] There is no evidence of different services despite the differences in fees. For example, trailing commissions are typically higher on equity funds and lower on fixed income funds. In such case, there is no evidence that an investor purchasing an equity fund would be provided with more services and advice than if the investor were to invest in a fixed income fund.

[227] The Investment Fund Institute of Canada, "Paying for Advice: Why Options are Important" (August 2014), at p.7.

[228] Trailing commissions are higher on equity funds and balanced funds (typically 1%) than on fixed income funds (typically 0.50%) and on money market funds (typically 0.25%). Trailing commissions are also higher on investments made under the front-end load option (typically 1%) than under the DSC option (typically 0.50%).

Higher trailing commissions for pre-packaged advice:

Most investment fund managers offer 'funds-of-funds', which are mutual funds that invest in other funds - most typically a portfolio of proprietary funds. They are pre-packaged mutual fund investment portfolios which relieve the dealer and their representative from having to do the fund selection and asset allocation they may otherwise be expected to do on their own for a client. Notwithstanding the efficiencies that funds-of-funds may provide for advisors, investors do not ultimately benefit from these efficiencies as the trailing commissions payable on funds-of-funds are the same or higher than on stand-alone equity mutual funds.[229] Accordingly, advisors who sell funds-of-funds receive greater compensation for seemingly less service and advice. The favourable dealer compensation paid on funds-of-funds may explain why this product makes up the bulk of net sales. According to data from IFIC, for the six years ending December 2015, funds-of-funds net sales totaled $191 billion versus $32 billion for traditional stand-alone funds. They have become the dominant product in the Canadian fund industry.

DIY investors in the discount channel may pay full trailing commissions:

As discussed above in connection with Issue 2, not all investment fund managers offer a discount/DIY series (e.g. Series D with reduced trailing commission of 0.25% or less) on their funds, nor do all discount brokers opt to put these series on their shelf when available. These series are available for purchase through certain discount brokerages only. Those investment fund managers that do not offer a discount/DIY series typically make their regular retail series available for purchase through the discount channel. These series pay full unreduced trailing commissions of 1% to the discount brokerage for execution-only services.

ii. The cost of advice provided through embedded commissions may exceed its benefit to investors

Investors may not derive offsetting financial benefits from the payment of trailing commissions:

Several studies show that investors derive almost no offsetting financial benefit from the payment of distribution fees, including trailing commissions. We refer to the studies by the *Executive Office of the President of the United States*[230], *John Chalmers et. al.*[231], *Stephen Foerster et. al.*[232] and *Daniel Bergstresser et al.*[233] discussed above in connection with

[229] See data on funds-of-funds provided in the Original Consultation Paper, Figure 10. Funds-of-funds are very popular products that account for almost half of all long-term mutual fund assets under management.

[230] See research by the Executive Office of the President of the United States, supra note 178.

[231] John Chalmers et al., supra note 179.

[232] Stephen Foerster et al., supra note 181.

[233] Daniel Bergstresser et al., supra note 183.

Issue 1 – *ii. Embedded commissions can encourage biased investment recommendations by dealers which negatively affect investor outcomes*. These studies overall show that:

- investors receiving conflicted advice through the payment of embedded commissions tend to perform worse than non-advised investors or passive benchmarks; and

- dealers/representatives collect more fees and commissions than any monetary value their investment advice may add to the account.

The following research however offers contrasting views on the value of advice:

- An econometric study by the *Centre interuniversitaire de recherche en analyse des organisations (CIRANO)*[234] finds that, on average, advised investors accumulate significantly more financial assets than do non-advised investors with similar socio-economic characteristics. This benefit of financial advice grows with the length of time households have received advice: after four to six years, the advised households have accumulated 1.58 times the amount accumulated by non-advised households; after 15 years, the difference has increased to 2.73 times. This difference in financial assets is explained most significantly by higher household savings rates and greater allocation into non-cash investments, not by better returns due to advisor skill;

- A *paper by the School of Public Policy at the University of Calgary*[235] asserts that embedded commissions facilitate affordable and broadly accessible financial advice which leads to greater individual wealth accumulation, which in turn makes a positive contribution to the retirement readiness of Canadian households and, ultimately, the economy. Based on a review of academic, government, regulatory and industry research, including the CIRANO study above, the author of the paper argues that eliminating embedded commissions would hurt less affluent investors who may not be willing or able to pay for advice upfront, thus creating an advice

[234] Claude Montmarquette et al., "Econometric Models on the Value of Advice of a Financial Advisor", CIRANO Institute, July 2012, http://www.cirano.qc.ca/pdf/publication/2012RP-17.pdf. Claude Montmarquette, one of the authors of that study, later admitted that a survivorship bias exists in the study and that he would like to see a more formal longitudinal study intimately tracking the performance of advised versus non-advised groups over a long period of time. See "*Financial Industry overselling value of financial advice*", Globe and Mail, November 15, 2012, http://www.theglobeandmail.com/globe-investor/personal-finance/household-finances/financial-industry-overselling-value-of-financial-advice/article5360796/. The study does not establish a causal relationship between the payment of trailing commissions and wealth accumulation as it does not identify whether its participants received advice through trailing commissions or other compensation arrangements. The study also does not factor into its findings any liabilities that its participants may have incurred through financial advice, which may offset the total wealth accumulation.

[235] Pierre Lortie, "A Major Setback for Retirement Savings: Changing How Financial Advisers Are Compensated Could Hurt Less-Than-Wealthy Investors Most", *University of Calgary School of Public Policy Research Papers*, Vol. 9, Issue 13, (April 2016), https://www.policyschool.ca/wp-content/uploads/2016/05/financial-advice-lortie.pdf.

gap which would be a major setback for Canada-wide retirement savings and Canadians' quality of life in retirement;

- The fund industry's latest *Pollara opinion survey*[236] finds that investors perceive the advice they receive from their advisor to be beneficial. Specifically, 95% of respondents indicated they can rely on their advisor to provide sound advice and 88% agreed they get better returns as a result of the advice they receive. Eighty-two percent attributed better savings and investment habits to their advisor, while 91% said they get value for the money they pay to their advisor;

- Research by *Vanguard Investments Canada Inc.*[237] finds that working with an advisor can theoretically add about 3% in net returns when following the Vanguard Advisor's Alpha framework for wealth management which involves the application of the following five wealth management principles:

    - Being an effective behavioral coach by helping clients maintain a long-term perspective and a disciplined approach (potential value add: 1.50%);

    - Applying an asset location strategy, i.e. allocating assets between taxable and tax-advantaged accounts (potential value add: from 0% to 0.42%);

    - Employing cost-effective investments, i.e. passively managed funds (potential value add: 1.31%);

    - Maintaining the proper allocation through rebalancing (potential value add: 0.47%); and

    - Implementing a spending strategy to help clients make important decisions about how to spend from their portfolios (potential value add: 0% to 0.41%).

Vanguard's research emphasizes that the potential 3% in net returns for clients should not be viewed as an annual value-add, but is likely to be intermittent, as some of the most significant opportunities to add value occur during periods of market duress or euphoria when clients are tempted to abandon their well-thought-out investment plans. The research also stresses that the applicability of the management principles, and the resulting value added, will vary by client circumstances (based on each client's time horizon, risk tolerance, financial goals, portfolio composition, and marginal tax bracket, to name a few) as well as implementation on the part of the advisor.

[237] Vanguard research, "Putting a value on your value: Quantifying Vanguard Advisor's Alpha", (September 2016), https://www.vanguard.com/pdf/ISGQVAA.pdf.

The beliefs of representatives may affect their advice:

A *study by Juhani Linnainmaa et al.*[238], using the same data as that used in the Foerster et al study[239], suggests that the quality of representatives' advice may be affected not only by conflicts of interest which can incent self-interested behavior, but also by personal beliefs and preferences regarding investment strategies (for e.g. the belief that active management – even after commissions – dominates passive management). They find that representatives manage their personal portfolios just like they manage their clients' portfolios. They trade frequently, chase returns, and prefer expensive, actively managed funds over low-cost index funds for both their clients and for themselves. Differences in representatives' beliefs affect not only their own investment choices, but also cause substantial variation in the quality and cost of advice they give to clients, raising costs for some investors.

The benefits of representatives' advice may largely be intangible:

Certain research suggests that, to the extent investors derive benefits from dealings with representatives, such benefits may be largely behavioral and thus intangible in nature, such as the development of good savings discipline, overcoming inertia, the reduction of investor anxiety, and the creation of trust. Such research includes:

- the *CIRANO Research* which finds that advised households in Canada accumulate greater financial assets over time, but that this finding is mainly due to their improved savings discipline due to the advisor.[240] Another CIRANO study finds that the discipline imposed by a financial advisor on the financial behavior of households and the increased savings of advised households are key to improving asset values of households relative to comparable households with no advisor.[241]

- the *paper by the School of Public Policy at the University of Calgary* which reviews a body of research showing that pervasive behavioral biases in decision-making limit an individual's ability to make sound financial decisions on their own. Such biases include the tendency to prefer short-term gratification (consumption) over longer-term returns (saving), inertia and status quo bias and a propensity to push to a later date actions that require self-control. The author asserts that financial advisors can help individuals overcome these behavioral weaknesses which can lead them to make sub-optimal investment decisions when left to their own devices.[242]

[242] Pierre Lortie, supra note 235, at pages 6 and 7.

- *research by Foerster et al.*, which posits on the possible reasons why fund investors prefer to use the services of dealers/representative despite the research's finding that the investment advice provided through commissions does not justify the fees paid. He states: "Given householders' strong preference for using financial advisors, it is likely that they receive other benefits beyond investment advice. Our results, however, impose constraints on the set of plausible benefits. The benefits cannot be of one-time nature because investors pay the fee continually as they remain advised. Such benefits may come in the form of financial planning, including advice on saving for college and retirement, tax planning and estate planning. It is also possible that financial advisors add value by mitigating psychological costs rather than providing financial benefit; that is, reducing anxiety (Gennaioli, Shleifer, and Vishny 2014) or eliciting feelings of trust (Guiso, Sapienza, and Zingales 2008) rather than improving investment performance.";[243]

- *research by Bergstresser et al.* which, further to their failure to find that brokers deliver substantial tangible benefits to investors in broker-sold funds, speculates that brokers may deliver substantial intangible benefits that we do not observe. The researchers state that "[b]rokers may help their clients save more than they would otherwise save, they may help clients more efficiently use their scarce time, they may help customize portfolios to investors' risk tolerances, and they may increase overall investor comfort with their investment decisions;" [244]and

- *research by Gino et al.* which finds a robust relationship between anxiety and advice seeking and between anxiety and advice taking. Specifically, this research finds that anxious individuals are found to be more likely to seek and rely on advice than are those in a neutral emotional state. The relationships between anxiety and advice seeking and anxiety and advice taking are mediated by self-confidence. Although anxiety also impairs information processing, impaired information processing does not mediate the relationship between anxiety and advice taking. Anxiety motivates individuals to seek advice from others and to be less discriminating between good and bad advice and between advice from advisors with and without a conflict of interest.[245]

APPENDIX B

OTHER OPTIONS CONSIDERED

In determining how best to address the investor protection and market efficiency issues identified, the CSA considered the merits of a number of other policy options in addition to discontinuing embedded commissions and those discussed in Part 6 of this Consultation Paper. Some of these options were proposed in the Original Consultation Paper, while some options were identified following the consultation. Each option was thoroughly and thoughtfully evaluated.

Generally, where we determined that an option would potentially address one issue to some degree, but at the same time fail to address or even exacerbate another issue, we opted not to pursue the option. Other options were not retained because they were found to be inconsistent or redundant with options proposed in CSA CP 33-404.[246]

Like the options discussed in Part 6 of this Consultation Paper, for each of the options discussed below, we analyzed the anticipated positive and negative impacts/effects on each of the following stakeholders:

- advised investors (specifically those with investable assets below $100K, between $100K and $500K, and above $500K);
- DIY investors;
- independent investment fund managers;
- independent fund dealers; and
- integrated financial service providers.

The following discussion provides a brief overview of the primary alternative options considered by the CSA and why we have decided not to pursue such options further.

1. Enhancements to Disclosure

The CSA considered making a number of disclosure-based enhancements to the current account statements[247] and fund fact documents required by the CRM2 and POS reforms respectively. The primary focus of these enhancements would be to increase investor awareness of the costs associated with their investments and the impact that such costs play on investor returns. The particular enhancements considered are discussed below.

i. CRM2 account statement enhancements

The CSA considered enhancing the disclosure on dealers' websites and/or in the account statement currently provided by dealers to provide the median percentage return and total cost in

[246] For example, the option of defining and disclosing advisor service levels in exchange for trailing commissions as set out in the Original Consultation Paper wasn't retained due to the proposals noted in CSA CP 33-404.

[247] Report on charges and other compensation and content of investment performance report.

dollars for a range of account sizes and risk types. The following diagram illustrates an example of the disclosure contemplated:

Median Client Account Returns in 2015

Account Size	Client Risk Tolerance: Low	Medium	High
0 - $100,000	2.5%	5.0%	3.0%
$100,000 - $500,000	2.5%	7.0%	3.0%
$500,000 and over	4.0%	10.0%	5.0%

Median Client Account Costs 2015

Account Size	Client Risk Tolerance: Low	Medium	High
0 - $100,000	750.25	801.38	1,002.30
$100,000 - $500,000	7,538.20	8,951.02	15,892.30
$500,000 and over	38,582.89	52,891.40	74,120.00

The foregoing information would be based on data aggregated at the firm level in respect of all accounts for which dealers are required to produce a report on charges and other compensation and investment performance.

If implemented, the CSA would anticipate this benchmarking exercise to have the following benefits:

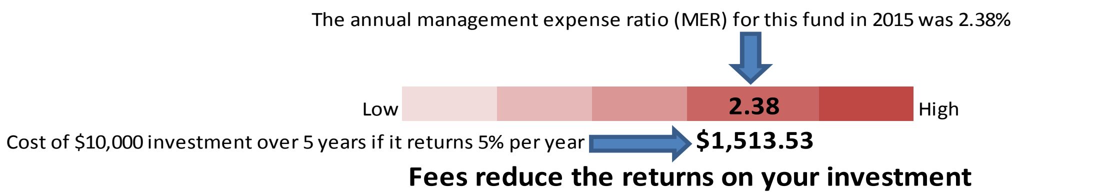
- it may better allow investors to assess their performance and costs relative to others, which in turn may allow investors to better assess the quality of the services they receive from their advisor; and
- it may over time create competition among advisors and incent advisors to enhance their level of service, which could also lead to potential cost reductions in the services provided.

The drawbacks of this option would be that:

- it would be difficult to control for variability in services provided, as well as investor objectives and time horizon, making comparisons misleading and/or ineffective;
- investors may require a certain level of investment knowledge to fully understand and interpret the additional information to benefit from the added disclosure (especially when considered in the context of all of the other information provided in the account statement); and
- some dealers who distribute proprietary products and are part of larger, integrated financial service providers, do not receive commission revenue such as trailing commissions and instead receive internal transfer payments from affiliates based on agreements with their corporate group. In these instances the true costs of the services provided may be difficult to compare across different dealers.

ii. POS fund facts enhancements

One potential way we considered to enhance the disclosure in the fund facts document was to provide more prominent fee disclosure, and greater context about the fees charged and their impact on performance. For example, as shown in the following diagram, the CSA considered requiring an illustration of where a fund's MER falls on a spectrum from "low" to "high" based on industry averages:



In conjunction with the foregoing, the CSA also considered requiring disclosure of the actual dollar amount of fees paid and returns foregone (each demonstrated over certain investment periods assuming specified returns). This disclosure could also have been supplemented with educational statements to alert a potential investor of the impact that fees play on their investments, such as "fees reduce the returns on your investment".

As an alternative to the foregoing, the CSA also considered amending the fund facts to provide enhanced disclosure regarding fund MERs and what they pay for. For example, the CSA considered breaking down the individual components of the MER to give an investor a more complete picture of the fund's expenses. Such information expressed in dollars would include, for example, the portion of management fees paid by the fund that directly compensates the investment fund manager for its services, the portion paid for operating expenses of the fund, and the portion that is used for distribution (such as all compensation paid to a dealer, including trailing commissions and sales commission, and marketing and promotional material). In addition, the CSA considered changing the term "trailing commissions", which is used in the fund facts and other reports provided to investors, to a more descriptive term such as "fees for advice and dealer services".

If implemented, the CSA expect that the disclosure enhancements could have the following benefits:

- investors may have greater fee awareness at the time of sale, which may also cause investors to consider the impact of the fees on their investment and/or the value of their advisor's advice before making an investment decision;
- investors may be prompted to ask more questions about the costs of the investment fund products being recommended and potentially ask for lower-cost alternatives; and
- to the extent that such disclosure leads advisors to recommend less expensive alternatives, competition among investment fund managers may be increased over time as managers may be pressured to lower costs to compete for market share.

Some drawbacks with this approach, however, would be that:

- investors may require a certain level of investment knowledge to fully understand and interpret the additional information to benefit from the added disclosure (especially when considered in the context of all of the other information provided in the fund facts document);
- the costs associated with the amendments may be burdensome and would be borne by investment fund managers (and ultimately, by fund securityholders);
- it may be difficult to compare information between different fund types (for example, between fixed income and equity funds); and
- it may suggest that fund types that typically have lower fees are better than fund types that typically have higher fees.

Why the CSA is not pursuing enhancements to disclosure

Provided that the disclosure is simple and easy to understand, the CSA anticipate that the enhancements discussed above may lead to greater fee awareness among investors, as investors would be provided with more prominent fee disclosure that would include additional information to help an investor assess the costs and performance of their investment (both at the time of sale and ongoing).

Notwithstanding the enhanced disclosure, the CSA chose not to proceed with this option as it does not anticipate that it will have any measurable effect in addressing any of the other investor protection and market efficiency issues identified by the CSA, particularly the conflicts of interest stemming from embedded commissions. In our view, and as discussed in more detail in Part 6, we think that disclosure alone may not be an effective remedy for conflicts of interest in an advisor-client relationship.

Moreover, the CSA do not believe it is prudent to pursue additional enhancements to disclosure until such time as the effectiveness of the current POS and CRM2 requirements has been tested through a post-implementation review.[248]

2. Investment Fund Manager Focused Initiatives

The CSA also considered implementing a number of targeted reforms at the investment fund manager level to help address the investor protection and market efficiency issues identified. The particular initiatives considered are discussed below.

i. Require a separate series or class of funds for each purchase option

One option considered was to require investment funds to maintain a separate series or class of securities for each available purpose option (i.e. front end sales charge, DSC and no load)[249].

[248] The CSA recently began a multi-year research project to measure the impacts of CRM2 and POS on investors and the industry. See note 149.

When an investment fund has multiple purchase options, part of the management fees earned by an investment fund manager are typically used to fund the payment of sales commissions to dealers on sales made under the DSC option. The cost of these commissions is commonly allocated to the fund as a whole and, by consequence, all investors in the fund regardless of the purchase option they chose. As a result, investors who purchase under the front end load option (who generally make an upfront commission payment directly to the dealer at the time of purchase) bear the same management fee as those investors who purchase under the DSC option (who do not make such upfront payments because the dealer's commission is paid directly by the investment fund manager).

To the extent investment funds would be required to maintain a separate series or class of securities for each available purchase option, the CSA would expect the resulting benefits to be that:

- the management fee charged to the particular series or class would reflect the costs attributable to that particular series or class; and
- costs incurred by each series or class would be borne only by investors in that particular series or class, as opposed to all investors equally.

However, if this proposal was implemented, the CSA would expect some of the following drawbacks:

- a proliferation in the number of individual fund series currently offered by investment fund managers, which may negatively impact investors as it will add further complexity to the investment choice, and potentially reduce fee awareness due to the increased number of options;
- a fund facts document would be required for each purchase option as each purchase option would be an individual series. This requirement would lead to increased costs on the investment fund manager (and ultimately, fund securityholders) and require investors to refer to the prospectus to discern all of the other available purchase options, further adding to the complexity of this option; and
- there would be no guarantee that the pricing for the separate series or class would reflect only the costs attributable to that particular series or class.

ii. Require trailing commission and other embedded sales commissions to be charged as an expense of the fund

Another potential approach was to require all trailing commissions and other embedded commissions (such as sales commissions paid on DSC options) to be an expense of the fund. In particular, this option would require separation of the trailing commission from the management fee and require disclosure of any trailing commission paid as an individual, asset-based fee of the fund. This approach would be similar to the current practice in the U.S., where investment

[249] We note that currently there a few mutual funds that separate fund series by each purchase option (i.e. front end, no load, and DSC). In these instances, we note that pricing for the DSC/low-load series is generally greater than other series to reflect the higher distributions costs associated with this series.

companies that pay trailing commissions to advisors bear an asset-based "12b-1 fee"[250], which is separate and apart from the management fee and covers the cost of distribution.

If this approach was implemented, the CSA would expect the requirement to make all embedded costs, which would include the sales commissions paid on DSC options, an expense of the fund to:

- necessitate the separation of purchase options into individual series (leading to the same benefits and drawbacks as the option discussed above);
- provide investors with greater transparency of the actual costs of advice and fund management; and
- allow investors to have greater control over, and awareness of, the costs and advice of distribution (as any increases to the commission, which would be an expense of the fund, would be subject to security holder approval). Similarly, the fund's independent review committee would also be in a position to provide governance and oversight over any potential rate increases.

There would be, however, several drawbacks to this approach that may reduce its effectiveness. For example:

- it could potentially lead to negative tax implications at the fund level;
- the funds offered by vertically integrated fund managers who make transfer payments rather than pay trailing commissions to their affiliated dealers may appear to have lower distribution costs than funds offered by independent fund managers as there may be no trailing commission to disclose; and
- changes to transfer payments would also not be subject to securityholder or IRC approval, which would limit the governance and oversight, as well as investor control, over these types of embedded payments.

iii. Require a standard class for DIY investors with no or reduced trailing commission

A further option considered was to require each investment fund to have a low-cost, "execution only" series or class of securities available for direct purchase by DIY investors and to require discount dealers/brokerages to offer such series or class. This series or class could be made available to investors in a number of ways, including through discount brokerages as well as directly from the investment fund manager. Since DIY investors typically do not seek advice, this series or class would have a lower management fee to reflect that no, or nominal, trailing commissions are paid to advisors. While advice is not provided to investors in these instances, the CSA understand that any nominal trailing commission paid would cover the costs of administrative, compliance, and technological services provided by the dealer or manufacturer.

---

[250] Details regarding "12b-1 fees" may be found at: https://www.sec.gov/answers/mffees.htm.

One potential benefit to this option would be that investors could choose to either: (a) use an advisor for the purchase of a fund and assume the higher costs associated with this choice; or (b) not use an advisor and have access to the same fund at a reduced cost. Accordingly, this option could:

- make the true costs of advice more apparent, which would allow those who use an advisor to better evaluate the value of the advice/services they receive;
- over time, lead investors to have greater awareness of, and control over, the level of fees paid with their investment; and
- improve the alignment between embedded dealer compensation paid and the services provided to DIY investors.

One potential significant drawback to this approach, however, is that it may not be feasible or possible for the CSA to compel investment fund managers to create a new “execution only” series; and/or compel dealers to distribute this type of series.[251]

Why the CSA is not pursuing the investment fund manager focused initiatives

The CSA acknowledges that these options would appear to introduce a beneficial governance mechanism to the fee structure that could help mitigate the conflict of interest that embedded compensation raises for the investment fund manager, and also possibly improve the transparency and fairness of fees for some investors. However, the CSA chose not to proceed with these initiatives as we determined that the costs associated with these reforms would likely outweigh any potential benefit to be received. Moreover, these reforms would fail to directly address some of the important investor protection and market efficiency issues we have identified, in particular the bias that embedded compensation engenders in sales recommendations and its detrimental effect on investor outcomes and market efficiency.

The CSA also determined that to the extent the initiatives would respond to an issue, it would mainly do so for only a small part of the market (in particular DIY investors)[252]. Moreover, these options would very likely add further complexity to our current fund fee structure through an expected significant increase in the number of new fund series, and fail to have a meaningful impact on competition.

[251] As further discussed in Part 4 of this Consultation Paper, we note that since 2012, certain investment fund managers have launched a series of securities for direct purchase for DIY investors (see for example, series D securities). However, the majority of mutual fund assets held in the discount brokerage channel still remain in a series that pay a full trailing commission. As a result, the CSA are of the view that this option could only reach its optimal effectiveness if investment fund managers are required to create, and dealers are required to sell, a discount series.

[252] According to *Investor Economics*, as at December 2015, only $56 billion of investment fund assets were held through the online/discount brokerage channel.

3. Cap commissions

Another option considered by the CSA was the possibility of setting a maximum limit (i.e. cap) on embedded commissions that investment fund managers may pay to dealers/representatives. Under this option, dealer firms and their representatives would be free to directly charge their clients commissions or fees for their services, either as a supplement or a substitute to embedded commissions. The CSA considered that this option could also be a possible interim step toward an eventual discontinuation of embedded commissions.

A potential way to implement this option would be to limit the trailing commission rate payable from the investment fund manager's management fee revenue. This option could also be complemented by additional disclosure in fund offering documents that would plainly describe the fees charged as "ongoing sales commissions". In addition to, or as an alternative to, setting a cap on trailing commissions at the investment fund level, another potential option considered was to impose a cap on the aggregate sales charge (in terms of a total dollar value) that could be paid by an individual investor at the account level over the length of a fund investment. In this way, once the cap is reached, the investor's assets could be switched to a series or class of securities that does not have any ongoing trailing commission or other embedded commission payment, bringing certainty of costs to the investor.

The CSA anticipates the primary benefits of this option to be:

- standardization and reduction in the variability of trailing commissions across funds, which may reduce incentives for (a) dealers and their representatives to sell funds based primarily on the trailing commission, and (b) investment fund managers to rely on the trailing commission to attract and preserve assets under management;
- reduction of the incentive for dealers and their representatives to promote the use of DSC options as the offering of these options is likely to be reduced or possibly eliminated as a result of the cap on embedded commissions; and
- decreased fund costs (as DSC purchase options typically tend to be more costly to administer than front end or no load options, we would expect a modest decline of 15-25 bps based on the pricing practices of investment funds that separate these purchase options into unique series).

The shortcomings with this approach would be:

- as the payment of embedded commissions will continue to be permitted, they may continue to create a barrier to entry that may reduce the likelihood of lower-cost providers entering the market;
- the presence of embedded commissions may continue to make the fee structure more complex, which may continue to inhibit investors' understanding of such costs;
- embedded commissions will still remain a "one-size-fits-all" fee that may not align well with the services and advice actually provided to individual investors in accordance with their specific needs, expectations and preferences; and

- to the extent DSC options are reduced or eliminated, this approach would tend to place firms that rely on these options (e.g. independent investment fund managers and dealers) at a disadvantage relative to those that do not (e.g. integrated investment fund managers and dealers).

Why the CSA is not pursuing a fee cap

Despite the apparent benefits to this approach, it is not being further considered by the CSA at this time, either as a stand-alone option or as an interim step toward discontinuing embedded commissions because, as the shortcomings demonstrate, many of the issues we have identified would likely continue to persist in the presence of a fee cap.

This option would also cause the CSA to take a non-traditional role of setting fee caps for investment products, rather than implementing measures intended to promote market efficiency. Moreover, the CSA is not prepared to cap commissions due to the potential unintended consequences that may result from a cap. For example, research has shown that a price cap can indirectly cause average prices to rise.[253] Accordingly, it would be very challenging to determine and justify the appropriate cap rate in the circumstances.

[253] Mark Armstrong, supra note 184. At page 6, Armstrong states: "Although the direct effect of a price cap is to reduce prices, the indirect effect of reduced search lessens each firm's demand elasticity so much that prices on average go up. This formalizes a claim sometimes made informally, which is that imposing price controls on an oligopoly market could raise equilibrium prices. One intuition for such a claim is that a price cap acts as a focal point for tacit collusion."

APPENDIX C

INTERNATIONAL MUTUAL FUND FEE REFORMS

Regulators of several international jurisdictions have implemented or are considering implementing regulatory reforms with a view to addressing some of the issues we discuss under Part 2 of this Consultation Paper. Below, we give an overview of the relevant reforms that have been implemented or proposed in the U.S., the U.K., Australia, New Zealand, Singapore, the European Union (**EU**), and in some of the EU's member states, namely the Netherlands, Germany and Sweden. We also give an account of their impact to date, as assessed further to initial post-implementation reviews.

1. United States

On April 6, 2016 the United States Department of Labor (**DOL**) issued a final rule to address conflicts of interest situations in the advisor-client relationship concerning the provision of retirement advice (the **Fiduciary Rule**).[254]

i. Scope of the regulation

The Fiduciary Rule significantly broadens the scope of who is considered a "fiduciary" under the *Employee Retirement Income Security Act of 1974* (**ERISA**). Generally, and among other requirements, those who are considered fiduciaries will need to abide by a fiduciary standard in the provision of investment advice to retirement accounts.

ii. Overview of the regulation

Under the Fiduciary Rule, any individual receiving compensation for providing advice that is individualized or specifically directed to a particular plan sponsor (e.g. an employer with a retirement plan), plan participant, or Individual Retirement Account (**IRA**) owner for consideration in making a retirement investment decision is a fiduciary. Such decisions can include, but are not limited to, what assets to purchase or sell and whether to rollover from an employer-based plan to an IRA. The fiduciary can be a broker, registered investment advisor, insurance agent, or other type of advisor. Basic order-taking is not considered a fiduciary activity.

To the extent an advisor is considered a fiduciary under ERISA, the advisor will need to abide by a fiduciary standard. The advisor must also, among other requirements, either avoid payments that create conflicts of interest (including, for example, trailing commissions) or comply with certain exemptions that will mitigate the conflict. Among the available exemptions is the "Best Interest Contract Exemption" (the **BIC Exemption**).

The BIC Exemption allows advisors to continue to receive commission-based compensation provided that they meet certain conditions intended to mitigate the conflict created by such compensation. Generally, advisors must acknowledge fiduciary status, provide advice that is in

[254] The Fiduciary Rule and summary by the DOL may be found at: http://www.dol.gov/ebsa/regs/conflictsofinterest.html

their client's best interest, avoid making misleading statements, and receive no more than reasonable compensation. The firm must also ensure it has policies and procedures aimed at mitigating conflicts of interest, must not provide incentives to its employee advisors to make recommendations that are not in the client's best interest, and must ensure all conflicts of interest are disclosed.

iii. Impacts

As compliance with the Fiduciary Rule will not be required until April of 2017, and there will be a further transition period for many requirements of the BIC exemption to January 1, 2018, the impacts of the Fiduciary Rule have yet to be determined.

2. U.K. – Retail Distribution Review

On December 31, 2012, the predecessor of the Financial Conduct Authority (**FCA**), the Financial Services Authority, introduced new rules under their Retail Distribution Review (**RDR**) reforms that aimed to raise advisor qualifications levels, improve the transparency of advisor charging and services, and realign advisor incentives with those of consumers by removing the commission they received from product providers.

i. Scope of the regulation

The commission ban relates to retail investment products only (including, but not limited to, investment funds and life insurance with investment component). It excludes mortgages and pure protection products such as non-investment life insurance, critical illness and income protection insurance.

The commission ban originally applied in the case of any advisor (whether tied to or independent of a product provider) making a recommendation in respect of a retail investment product to a retail client. It requires advisors to be paid through fees charged directly to clients and not solicit or accept from providers any other commissions, remuneration or benefit of any kind (regardless of whether they intend to refund the payments or pass the benefits on to their retail clients). Ongoing commission payments generated by transactions entered into on or before the RDR entered into effect were not affected.

The commission ban was subsequently extended to retail platform service providers on April 6, 2014, with a sunset clause permitting ongoing commission payments generated by transactions executed on or before April 5, 2014 to continue until April 5, 2016 (when they were required to terminate).

ii. Overview of the regulation

The reforms under RDR introduce the following requirements:

- **Ban on conflicted advisor remuneration**: The rules require advisors to set their own charges for their services in agreement with their clients. Advisors may no longer receive commissions from product providers or commissions otherwise embedded in the cost of the product. Their charging structure must be based on the level of service they provide, rather than the particular provider or product they recommend. Whether the charging structure is based on a fixed fee, an hourly rate or a percentage of funds invested is for the advisor to decide together with the client, provided the advisor always bears in mind its duty to act in the client's best interests.[255] Ongoing fees are permitted only where a client is paying for an ongoing service that has been properly disclosed or where the product is one in which the client makes regular payments, and may be cancelled by the client at any time without penalty.

Consumers can choose to pay an advisor's fee separately from the payments for the product, or have the advisor's fee deducted from their investment/insurance contribution. The FCA allowed for **"provider facilitation" of payments** under which the customer agrees to payments with their intermediary, but it is the provider that delivers the payment to the intermediary, for example from premiums paid. If payment is to be taken from the investment, the product provider must obtain clear instructions from the client about the amount to be deducted.

- **"Independent" vs. "Restricted" advice**: The rules aim to ensure that investors understand the services they receive by requiring advisors to clearly describe their services as either "independent" or "restricted". An "independent" advisor provides personal recommendations that are: (a) based on a comprehensive and fair analysis of the relevant market, and (b) unbiased and unrestricted. Where this test is not satisfied, an advisor offers "restricted" advice (e.g. advice limited to proprietary products or a reduced range of products).

- **Increased proficiency and professionalism**: The rules require that individual advisors meet higher proficiency requirements, subscribe to a code of ethics, carry out at least 35 hours of continuing professional development a year, and hold a statement of professional standing from an accredited body. Advisors that do not meet these standards are no longer able to make personal recommendations to retail customers since December 31, 2012.

The desired outcomes of the RDR were set out in a discussion paper (FSA DP07/01) and included, among others:

- standards of professionalism that inspire consumer confidence and build trust;

- an industry that engages with consumers in a clearer way about products and services; and

- compensation arrangements that allow competitive forces to work in favour of consumers.

[255] In the U.K., the *Financial Conduct Authority Handbook* provides that all registrants must act honestly, fairly and professionally in accordance with the best interest of the client. This best interest standard is qualified, however, since registrants are subject to a spectrum of requirements which vary according to the nature of the advice given to clients ("independent", namely on a broad range of products, and "restricted", namely on mainly proprietary or other specific products).

iii. Impacts

a. FCA – First stage of RDR post implementation review:

On December 16, 2014, the FCA published the findings from the first stage of its post implementation review.[256] While the FCA cautioned that it is too early to obtain a definitive picture of the impact of RDR, the evidence from the first stage of the review showed a positive picture, with encouraging signs that the RDR is on track to deliver its objectives in many areas. The main findings are described below:

- **Reduced product bias**: The removal of commission paid by providers to advisors has reduced product bias from advisor recommendations, reflected in a decline in the sale of products which paid higher commissions pre-RDR and an increase in the sale of those which paid lower or no commission pre-RDR. This reduced bias has led to an increased focus by advisors on the provision of more holistic ongoing advice services and an enhanced quality of advice for at least some consumers.

- **Reduced product cost and improved competition**: Product prices have fallen by at least the amounts paid in commission pre-RDR, and there is evidence some product prices may have fallen even further. This is due in part to the introduction of simpler products and funds with lower fees and advisors and platforms exerting more competitive pressure on providers, with platforms increasingly able to negotiate lower product costs. The removal of commission also means that providers who sold lower or no commission products pre-RDR (e.g. index tracker funds) are now competing on a more equal basis.

- **Higher advice costs for some**: Post-RDR, one-off charges appear in line with pre-RDR initial commissions paid to advisors and ongoing charges have increased relative to ongoing commissions for at least some firms and in some regions of the U.K. There however lacks a comprehensive evidence base (particularly for the pre-RDR period) to tell whether payments to advisors have increased more generally, or whether such changes will be long-term. A longer post-RDR trend in advisor charges will help inform this.

- **Number of firms/advisors not significantly impacted**: While there was some exit from the advisory business in the period leading up to RDR, by the banks and by some financial advisors (largely due to the requirement to meet higher proficiency requirements and also due to a number of market factors), there remains a large number of advisory firms and advisors to serve consumers. Average revenues and profitability of these advisory firms has increased.

---

[256] FCA, *Post-Implementation review of the Retail Distribution Review – Phase 1*, December 2014, https://www.fca.org.uk/publication/research/post-implementation-review-rdr-phase-1.pdf. The FCA commissioned external consultants Europe Economics to undertake the first phase of the review. Their full report is available here: https://www.fca.org.uk/static/documents/research/rdr-post-implementation-review-europe-economics.pdf.

- **Increased focus on higher wealth clients**: The reforms have led many firms to consider the fundamentals of their business models and make key changes, e.g. segmenting their customers, with some focusing on services to those with higher levels of investible assets and more complex (and profitable) investment advice needs.

- **Limited evidence of an "advice gap"**: There was limited evidence of an advice gap emerging for lower-wealth consumers as a result of some firms having moved to target higher net worth clients post RDR and not being able or willing to provide advice to consumers outside this segment. The evidence however suggested that the number of consumers affected by this was generally small and that these consumers were likely to have been picked up by other advisory firms. The FCA determined that there was little evidence that the availability of advice had reduced significantly as a result of the RDR, with the majority of advisors still willing and able to take on more clients. At the same time, there was evidence that consumers were increasingly buying products on a non-advised basis. The FCA also found that the group of consumers who seek advice but were not willing to pay the true cost of such advice on the grounds that it did not represent value for money was likely to have increased under the RDR. The FCA however pointed out that these consumers existed to a degree prior to the RDR and that it was arguable as to whether this group was in fact part of an "advice gap". The FCA further noted that the increase in this group of consumers had been limited by the adoption by the majority of advisory firms of contingent charging structures rather than upfront fees. The FCA also noted the efforts they were making to increase the supply of lower-cost simplified advice to meet consumer demand.

The FCA expects to publish the next phase of its post-implementation review in 2017, which will allow it to draw from at least three years of evidence. A subsequent, third phase of the review will consider the longer-term implications**.**

b. HM Treasury and FCA – Financial Advice Market Review:

In the face of concerns of a potential advice gap for some consumers and a lack of engagement with financial services, the HM Treasury (**HMT**) and the FCA launched the Financial Advice Market Review (**FAMR**) with a consultation paper (**Call for input**) published on October 12, 2015[257], seeking input on how to make financial advice work better for consumers. The aim of the review was to explore ways in which government, industry and regulators can take individual and collective steps to stimulate the development of a market which delivers affordable and accessible financial advice and guidance to everyone, at all stages of their lives.

The review explored the supply and demand sides of the market for financial advice and guidance, the barriers to providing these services and the potential remedies.

---

[257] HM Treasury & FCA, FAMR – Financial Advice Market Review – Call for input, October 2015, http://www.fca.org.uk/static/documents/famr-cfi.pdf.

HMT and the FCA published the final FAMR report on March 14, 2016.[258] Some of the report's key findings include:

- **Access to advice**: Following the RDR, FAMR notes that the U.K. has a high quality financial advice market and that standards and professionalism in the industry have increased. The drive for higher standards and professionalism, along with other factors, has however contributed to a reduction in advisor numbers. The move to fee-based advice on retail investment products has improved transparency and eliminated conflicts of interest caused mainly by a commission-driven model. Nonetheless, advice is expensive and is not always cost-effective for consumers, particularly those seeking help in relation to smaller amounts of money or with simpler needs. It may not be economical for firms to serve consumers with lower amounts to invest or with simple needs. These changes have highlighted concerns that there is an advice gap in the U.K. as not all consumers can currently access the advice they need at a price they are willing or able to pay. FAMR also notes that the low levels of consumer demand for advice are also contributing to the advice gap. Such low demand is driven by several factors, including but not limited to high costs (especially relative to small amounts available to invest), limited confidence in engaging with financial issues, and a lack of trust following past instances of mis-selling.

- **Decline in advisor numbers**: The review notes a decline in advisor numbers over recent years (an approximate 23% decline of registered advisors between 2011 and 2014) for a range of reasons, including the introduction of the RDR. FAMR identifies that the majority of advisors exiting the market during this period were those employed by the banks and building societies. There are a number of reasons for these exits, including declining profitability of branch-based distribution models, a lesser role for branch-based activity, anticipation of the RDR and the consequences of past episodes of mass mis-selling (in terms of redress and reputational damage).

- **Services to mass market customers**: FAMR also identifies that banks, insurers and other large firms have, however, traditionally been more likely to serve mass-market customers with lower levels of wealth. The FCA's recent survey of advisors found that customers with pension wealth of less than £30,000 made up 27% of customers advised by medium or large advisory firms and 19% of customers advised by very small firms (those with only one or two advisors). This is likely to be because firms with high numbers of advisors are able to benefit from economies of scale, which make it possible to serve consumers with lower levels of affluence. Larger, more diversified financial services firms also benefit from having an existing customer base across which they can cross-sell their advisory services.

- **Cost of receiving advice**: FAMR notes that there are many consumers who would be willing to pay for advice but who are discouraged by higher prices. The responses received to the Call for input noted, among other things, that the perception and the reality of clients affect their willingness or their ability to pay fees for advice. FAMR also

[258] https://www.fca.org.uk/publication/corporate/famr-final-report.pdf.

notes that it is currently difficult for the traditional model of advice to serve consumers economically at lower fee levels.

- **Cost of providing advice**: For the cost of providing advice, a 2016 industry survey of advice firms suggested that, over the last two years, the proportion of firms who ask for a minimum portfolio of more than £100,000 has more than doubled, from around 13% in 2013 to 32% in 2015. The FCA's recent survey of advisors also supports this, suggesting that 45% of firms very rarely advise customers on retirement income options, if those customers have small funds (i.e. less than £30,000) to invest. There are several reasons for this. A consistent theme emerging is that there are significant minimum costs per customer associated with supplying face-to-face advice which inevitably affect commercial decisions about whether to offer services to consumers with lower amounts to invest. It will also inevitably affect whether the consumer feels that the service they receive represents good value for money.

  FAMR notes, however, that some larger firms have recently signalled a return to the advice market. In some cases this is being facilitated by effective and creative use of new technologies. A number of firms currently in the advice market are also planning to increase the number of customers they serve. The FCA's recent survey of advisors found that around 30% of firms surveyed expect to grow the number of advisors over the next year.

The FAMR's recommendations for tackling the barriers to consumers accessing advice fall into 3 key areas:

- **Providing affordable advice to consumers –** these recommendations include proposals to make the provision of advice and guidance to the mass market more cost-effective. FAMR makes a number of recommendations intended to allow firms to develop more streamlined services and engage with customers in a more engaging and effective way. These recommendations include a proposal that the FCA should set up a dedicated team to assist firms that are seeking to develop automated advice models to bring those to market more quickly;

- **Increasing the access to advice –** these recommendations are aimed at increasing consumer engagement and confidence in dealing with financial advice. FAMR proposes a number of measures to help consumers engage more effectively with advice. These recommendations include making their own information more easily available to those that advise them; the development of 'rules of thumb' and the use of nudges to encourage customers to seek support at key life stages and recommendations to help employers give more support to their staff in financial matters; and

- **Addressing industry concerns relating to liabilities and consumer redress –** these recommendations aim to address concerns about the boundary between regulated advice and more general forms of guidance. In particular, firms do not feel able to develop more streamlined advice services that meet simple consumer needs in the absence of clarity around the liabilities involved in providing simpler forms of advice or guidance. Firms consider that if streamlined advice services cannot be guaranteed to involve lower liabilities, it may not be commercially worth the risk to provide it. FAMR makes a number of recommendations to increase clarity and transparency about the way in which the Financial Ombudsman Service deals with consumer complaints. The report also includes proposals relating to the funding of the Financial Services Compensation Scheme to assist in managing longer term liabilities.

In June 2016, a Financial Advice Working Group was established to take forward the three recommendations outlined above. Since then, the FCA has set up an Advice Unit to provide regulatory feedback to firms developing automated models that seek to deliver lower-cost advice to consumers.[259]In addition, HMT has issued a consultation looking to narrow the current definition of regulated investment advice.[260]

c. FCA – Retail Mediation Activities Return results:

In October 2016, the FCA issued a Data Bulletin[261] providing insights into the activities, revenue and charges of advice firms post RDR. These insights are based on the FCA's analysis of data from the Retail Mediation Activities Return, which is submitted by approximately 12,000 FCA regulated firms. The FCA's findings are:

- *Overall revenue:* Overall revenue from retail investment business increased by 16% between 2013 and 2015 and the number of firms increased by 6% over the same period;

- *Revenue from commission vs direct fees/charges:* In 2015, commission accounted for 31% of revenue earned and direct fees/charges accounted for 64%, compared to 2013 when commission accounted for 56% and direct fees/charges accounted for just 37%. The reduced but continuing revenue from commissions consists of legacy (pre-RDR) business which advice firms are allowed to continue to receive under RDR subject to certain conditions;

- *Type of advice:* 83% of retail advice firms report that they provide independent advice with only 14% providing restricted advice and 3% both types. However, restricted advice accounted for 62% of revenue from advisor charges (with independent advice at 38%). These numbers reflect that, although fewer in number, the restricted advice population includes some very large firms that account for a significant slice of the total business conducted;

---

[259] Further details about the Advice Unit can be found here: https://www.fca.org.uk/firms/project-innovate-and-innovation-hub/advice-unit.

[260] Further details of this consultation can be found here: https://www.gov.uk/government/consultations/amending-the-definition-of-financial-advice-consultation/amending-the-definition-of-financial-advice-consultation.

[261] FCA Data Bulletin, October 2016, Issue 7, https://www.fca.org.uk/publication/data/data-bulletin-issue-7.pdf

- *Method of advisor payment:* Payments facilitated by product providers are the main form of advisor payment accounting for 81% of initial charges and 74% of ongoing charges, with 19% and 26% respectively being paid direct to the advisor by the client;

- *Charging method:* The main advisor charging methods include charging by the hour, as a percentage of investment value, fixed fee, or a combined charging structure, with the most typical charging method used being charging as a percentage of investment value. Some firms may use more than one method of charging;

- *Fee rates:* Where charging as a percentage of investment value, the average charges for initial advice are 1% (minimum) and 3% (maximum). For ongoing charges, the average rates are 0.5% (minimum) and 1% (maximum). Where charging an hourly fee, the most common hourly rate nationally is £150 per hour. National average minimum and maximum rates vary between £150 and £195 per hour, with regional variations in charges.

As for insights into the activities of product providers post-RDR, a sales activity report from the Investment Management Association[262] shows that from 2012 to 2015, gross retail sales of investment funds in the U.K. increased from £105.4 billion to £160.2 billion, a 52% increase.

3. Australia – Future of Financial Advice

The Future of Financial Advice Reforms (**FOFA**) came into effect in Australia on July 1, 2012. Its primary objective was to improve the quality of financial advice, and access to this advice for Australian consumers. Compliance with the new rules was voluntary in the first year of operation, and became compulsory from July 1, 2013.

i. Scope of the regulation

The regulation under FOFA applies to all advice given to retail clients on any retail financial product except non-life insurance products and basic banking products.

ii. Overview of the regulation

Key changes introduced under FOFA include those listed below:

- **Prospective ban on conflicted remuneration**: Any monetary or non-monetary benefits that could reasonably be expected to influence the distribution of, and advice to clients about, retail financial products are considered to be conflicted remuneration. There is a prospective ban on upfront and trailing commissions as well as a ban on any form of

[262] The Investment Association, "Summary of UK Domiciled Unit Trust / OEIC Sales 2006-2016", http://www.theinvestmentassociation.org/assets/files/press/2016/stats/stats0116-02.pdf

volume-based payments in relation to distribution and advice given on retail investment products. Commissions paid by product providers to advisors in relation to investments in place prior to the coming into force of the FOFA reforms are not banned and can continue to be paid. The key aim of this change is to ensure the interests of advisors and retail clients are more closely aligned, improving the quality of advice provided, as well as removing the potential for providers to influence the advisor's recommendation.

- **Advisor charging regime**: Advisors are expected to agree on their fees directly with their clients, and disclose those fees in a clear manner. If an advisor is providing an ongoing service for which clients pay ongoing fees such as asset-based fees, they are required to ask clients to opt in (or renew) their advice agreement every two years. Moreover, advisors are prohibited from charging asset-based fees on borrowed amounts that are to be used to acquire financial products by or on behalf of a client. If a client has a portfolio of products purchased with a combination of borrowed and non-borrowed amounts, asset-based fees can be charged on the proportion of the portfolio purchased with non-borrowed amounts.

- **Statutory best interest duty:** Advisors are required to act in the best interests of their clients, subject to a 'reasonable steps' qualification[263], and place the best interests of their clients ahead of their own when providing personal advice to retail clients.

- **Annual fee disclosure statement**: Advisors must give each client an annual statement containing information from the previous 12-month period about:
  - the amount of fees paid by the client;
  - the services that they were entitled to receive; and
  - the services that they did receive.

In 2014, a newly elected Australian Government introduced a Bill proposing several amendments to the new requirements under FOFA with the aim of streamlining the regulations and reducing compliance costs. In November 2015, the Senate passed a motion regarding the Bill, effectively disallowing a number of the proposed amendments, and otherwise implementing minor and technical changes,[264]none of which eliminated or changed the above core elements of the FOFA reforms.

---

[263] There is a safe harbour that advice providers can rely on if they can show that reasonable steps relating to know your client, know your product, suitability and proficiency are taken by the registrant.

[264] For example, one amendment that was passed included an extension of the time for advisors to provide renewal opt-in notices and fee disclosure statements to retail clients from 30 to 60 days after the clients' renewal notice day.

iii. Impacts: FOFA Post Implementation Review

On September 17, 2014, the Australian Securities and Investments Commission reported on the findings of its review of the implementation of the FOFA reforms.[265] Key findings include:

- Most dealer registrants did not change their service offerings as a result of FOFA, although some indicated an increase in scaled advice;[266]
- One-third of the registrants had changed the composition of their product shelf in light of the best interest duty and related FOFA obligations;[267]
- Advisor numbers had not changed;
- The advice industry remained concentrated,[268]and registrants were often affiliated with issuers of financial products;[269]
- Most registrants reported changes to their revenue streams, with a reduction in commissions after the ban and an increase in advice fees;
- Most registrants stated the biggest challenges they had experienced in implementing the reforms related to the requirement to provide fee disclosure statements and the related changes they needed to make to their systems; and
- Registrants considered the best interest duty to pose a relatively high risk of non-compliance in the future. To mitigate this risk, registrants had revised their advice systems and procedures, and most were relying on the "reasonable steps" safe harbour provision to demonstrate their compliance with the best interests duty and related obligations.

---

[265] ASIC Report 407, Review of the financial advice industry's implementation of the FOFA reforms, September 2014, http://download.asic.gov.au/media/1845586/rep407-published-17-september-2014.pdf. The findings in the report are based on ASIC's review of 60 registrants accounting for close to 10,000 advisors servicing 4.6 million retail clients.

[266] The FOFA reforms allowed for "scaled advice", being a form of personal advice that is limited in scope, either by being in response to a limited range of issues or by addressing a specific area of the investor's needs (for example, insurance needs or saving for a home). ASIC stated its view that "scaled advice" must still be of the same high quality as more comprehensive advice and is therefore subject to the same legal requirements as advice that is fully comprehensive, including ensuring that the advice provided is in the best interests of the client.

[267] Of the changes to approved product lists, 14% were decreases to the types and number of products, 11% related to benchmarking and only 4% increased the number or types of products.

[268] Over 90% of the retail clients of licensees in the sample were clients of the 15 largest licensees (25% of the sample), with the remaining 75% of licensees in the sample accounting for just 10% of the clients.

[269] For large firms, 25% of the products on their approved product lists were issued by related parties.

4. *New Zealand – Review of Financial Advisers Act 2008 and Financial Service Providers Act 2008*

In July 2016, the Ministry of Business, Innovations and Employment (**MBIE**) of New Zealand published a review[270] of two acts governing the financial advice industry, namely the Financial Advisers Act 2008[271] and the Financial Service Providers (Registration and Dispute Resolution) Act 2008.

The 2016 review had four main objectives:

- Ensure consumers can access the financial advice they need;
- Improve the quality of financial advice;
- Be enabling and not impose any undue compliance costs, complexity or barriers to innovation; and
- Ensure access to redress.

The MBIE concluded that new reforms were needed to move the legislator's focus away from professionalizing advisors toward creating a level playing field of regulation for all those providing financial advice. The MBIE stated that the reforms were to be refined through consultations and would be officially introduced to the New Zealand legislative authorities at the end of 2016.

Currently the MBIE expects to make the following key changes to the legislation governing financial advice:

- **Removing some regulatory boundaries**: The requirement for advice tailored for a consumer to be provided by a natural person will be removed in order to enable robo-advisors to offer tailored advice;
- **Best-interest standard**: All individuals or robo-advisors providing financial advice will be required to place the interests of the consumer first and to only provide advice where competent to do so. All financial advice will also be subject to a Code of Conduct, where

[270] Ministry of Business, Innovation & Employment – Factsheet – Review of the operation of the Financial Advisers Act 2008 and the Financial Service Providers (Registration and Dispute Resolution) Act 2008 – July 2016, http://www.mbie.govt.nz/info-services/business/business-law/financial-advisers/review-of-financial-advisers-act-2008/pdf-document-library/factsheet-review-fa-fspa-13-july-2016.pdf.

See final report here: http://www.mbie.govt.nz/publications-research/publications/business-law/Final%20report%20on%20the%20review%20of%20the%20FA%20and%20FSP%20Acts.pdf.

[271] The scope of the Financial Advisers Act encompasses advice for several financial products, including but not limited to debt securities, equity securities, managed investment products, investment-linked insurance contracts and derivative products. Section 18 of the Financial Advisers Act stipulates who is permitted to provide personalized service to retail clients in relation to certain financial products.

standards will be set that are consistent with those legislative obligations. In addition, a client-care obligation will also be introduced, requiring advisors to ensure that consumers are aware of the limitations of their advice, such as how many products and how many providers they have considered;

- **Professional designations**: To improve consumer understanding, current financial advisor designations will be replaced with simpler ones;

- **Disclosure**: More meaningful disclosure requirements for all types of advice will be introduced to improve consumer understanding and transparency. Disclosure will be simplified and shortened to include core information about the scope of service, remuneration (including commissions) and competence, and would be available in user-friendly formats;

- **Licensing**: Anyone (or any robo-advisor) providing financial advice will need to be licensed. Licensing will be required at the firm level. There will be flexibility, depending on the size and nature of the firm, in how prospectus licensees will be expected to meet the licensing requirements;

- **Stronger connection to New Zealand**: To maintain the reliability of the regulation of New Zealand financial markets, firms will only be able to be licensed if they are in the business of providing financial services from a place of business in New Zealand or if they are providing services to New Zealanders.

In their review, the MBIE states that they will not prohibit sales commissions because they believe banning is not a 'silver bullet' that will improve the quality of advice. They recommend focusing on the conduct of those providing financial advice, rather than imposing a ban or restriction on commissions. They believe a ban might limit access to financial advice, especially when New Zealanders are already reluctant to pay for financial advice. The MBIE states that it also believes that banning commissions would not address conflicts of interest arising from soft-commissions, bonuses and the sale of proprietary products.

Nonetheless, the MBIE states that they will closely monitor the conduct of advisors, alongside the New Zealand Financial Market Authority, to determine whether their reforms will be sufficient to ensure consumers have access to quality and transparent financial advice.

5. Singapore

In March 2012, the Monetary Authority of Singapore (**MAS**) announced the launch of the Financial Advisory Industry Review (**FAIR**) with the aim of raising the standards of practice in the financial advisory industry and improving the efficiency in the distribution of life insurance and investment products in Singapore. A panel, chaired by MAS and comprising representatives from industry associations, consumer and investor bodies, academia, media, and other stakeholders (**FAIR Panel**), was formed in April 2012 to conduct the review. In January 2013, FAIR Panel released their recommendations[272] under the following key themes:

- raising the competence of financial advisors;
- raising the quality of financial advisory firms;
- making financial advising a dedicated service;
- lowering distribution costs; and
- promoting a culture of fair dealing.

In particular, the FAIR Panel recommended that financial advisory firms be prohibited from paying their financial advisors cash and non-cash incentives which are:

- tied to the sales volume of a specific investment product; and
- over and above the typical commissions paid to financial advisors for selling that investment product.

In response to the public consultation on the recommendation of the FAIR Panel, the MAS stated that they would not change the remuneration structure of financial advisors by capping or banning commissions[273] for the following reasons:

- based on an April 2012 survey conducted by the MAS, 80% of respondents said they were not willing to pay an upfront fee for advice;
- the implementation of a fee-based regime could result in consumers needing to pay more for their protection or investment needs, especially for consumers with smaller investments; and
- there could be other unintended consequences, such as a reduction in the number of financial advisors in the industry, exacerbating the lack of financial and protection planning by consumers.

The MAS stated that they will take into consideration the effectiveness of the current measures and the experience of other jurisdictions with a mandated fee-based regime.

In 2015, under the New Financial Advisers Remuneration and Incentive Regulations, the MAS introduced a cap on specified commissions that financial advisors can receive from sales of life

[273] Monetary Authority of Singapore, *Response to Feedback Received – Public Consultation on Recommendations of the Financial Advisory Industry Review*, September 2013, page 55, http://www.mas.gov.sg/~/media/MAS/News%20and%20Publications/Consultation%20Papers/Response%20to%20Feedback%20Received%20on%20Public%20Consultation%20on%20Recommendations%20of%20the%20Financial%20Advisory%20Industry%20Review.pdf

insurance policies[274]. This rule was due to come into force in January 2016, but its implementation has been delayed until January 2017 further to the industry's request for more time to implement the changes.

6. European Union – Markets in Financial Instruments Directive II (MiFID II)

MiFID II is designed to take into account developments in the trading environment since the implementation of MiFID in November 2007 and, in light of the financial crisis, to improve the functioning of financial markets making them more efficient, resilient and transparent. MiFID II came into force on July 2, 2014, and is required to be transposed into national law by Member States by July 3, 2017, and must generally apply within European Union Member States by January 3, 2018.[275]

i. Scope of the regulation

MiFID II introduces new investor protection measures, which include, among other changes, a ban on inducements for independent advisors and portfolio managers (discretionary investment management). The ban applies to all "financial instruments" within the scope of MiFID II that they sell to both institutional and retail clients (including, but not limited to, funds).

ii. Overview of the regulation

Some of the key investor protection measures introduced by MiFID II include those listed below:

- **Ban on inducements**: Firms providing independent advice or portfolio management may not accept and retain[276] any fees, commission, or monetary or non-monetary benefits from third parties in relation to the advice or service. Minor non-monetary benefits from third parties (such as training on the features of a product) are permitted, provided they are: (a) capable of enhancing the quality of service provided to a client; (b) of a scale and nature such that they could not be judged to impair compliance with the firm's duty to act in the best interest of the client; and (c) are clearly disclosed. Commissions on non-independent advice (e.g. in respect of in-house products) are still allowed. However, any such commissions must: (a) be designed to enhance the quality of the relevant service to the client; (b) not impair compliance with the firm's duty to act honestly, fairly and professionally in accordance with the best interest of its clients; and (c) be clearly

[274] Additional information is available here: http://www.mas.gov.sg/news-and-publications/speeches-and-monetary-policy-statements/speeches/2015/explanatory-brief-financial-advisers-amendment-bill-2015-and-insurance-bill-2015.aspx and here: http://www.mas.gov.sg/~/media/MAS/News%20and%20Publications/Consultation%20Papers/Annex%2017%20New%20Financial%20Advisers%20Remuneration%20and%20Incentive%20Regulations.pdf.

[275] For more details of the regulation, consult the website of the European Commission at: http://ec.europa.eu/finance/securities/isd/mifid2/index_en.htm.

[276] Firms may accept compensation from third parties if that compensation is passed through to the client in its entirety and hence is not retained by the firm.

disclosed to the client, in a manner that is comprehensive, accurate and understandable, prior to the provision of the relevant service.

- **Independent vs non-independent advice**: Firms must tell clients in advance whether their advice is provided on an independent basis or a more restricted analysis of the market and, in particular, whether the range is limited to financial instruments issued or provided by related entities. Firms that provide advice on an independent basis must assess a sufficiently large number and diversity of financial instruments available on the market and should not limit the range to instruments issued by the firm or related entities.

- **Bundled services**: Firms have to inform clients whether they can buy the different components of a bundled service separately, providing information about costs and charges in respect of each component.

- **Suitability**: Existing suitability requirements applying to investment firms providing investment advice or portfolio management are enhanced with the requirement to now take into account the client's risk tolerance and ability to bear losses.[277] In addition, when an investment firm recommends a bundled package of services or products, the overall package must be suitable. And finally, firms providing investment advice must provide clients a suitability report before the transaction is made or immediately after the client becomes bound, specifying how the advice given meets the preferences, objectives, and other characteristics of the client.

- **Information on costs and charges**: Information on all costs and charges, including the cost of advice and the cost of the product must be disclosed, the method of payment stated, along with details of any third-party payments. All costs and charges should be aggregated so the client understands the overall cost as well as the cumulative effect on the return of the investment (with an itemized breakdown should a client request it). Information about costs and charges is to be provided, where applicable, at least annually post-sale.

- **Product governance**: Manufacturers of financial instruments will have to maintain a product approval process that will identify the target market for each product and assess all relevant risks. Firms that offer such products but do not manufacture them will have to understand the features of those products, including the identified target market.

[277] Current suitability requirements under MiFID include the requirement to obtain information regarding the client's knowledge and experience, their financial situation and investment objectives.

iii. Impacts

As the new requirements won't apply until 2018, the impacts of these new measures remain to be determined.

7. Netherlands – Ban on commissions (provisieverbod)

On January 1, 2013, the Netherlands Authority for the Financial Markets (**AFM**) introduced a complete ban on commissions on financial products outside the scope of the original EU Markets in Financial Instruments Directive (**MiFID**), such as mortgages and life insurance, with the aim of achieving a cultural shift from product-driven sales of financial products toward client-centered advice. On January 1, 2014, the ban was extended to all retail investment services (e.g. investment advice (whether independent or restricted), execution-only and (individual) portfolio management) in respect of financial instruments within the scope of MiFID, such as funds.

i. Scope of the regulation

The ban on commissions now applies to all financial products sold by way of (individual) portfolio management, investment advice or execution only. The products covered by the ban include mortgages, insurance (except property and casualty insurance)[278], savings products such as annuities, and investment funds.

ii. Overview of the regulation

The key elements of the reforms include those listed below:

- **Ban on inducements**: Commission payments on all financial products are banned.[279] Advisors have to set distinct prices for advice and intermediation. Fees are agreed between the intermediaries and consumers. To help consumers spread the cost of distribution over time, intermediaries and consumers can agree on the fee payment being spread over a set period (maximum 24 months).

- **'Cost price' approach**: Fees charged for advice have to cover the costs incurred in the process of giving the advice. Providers of financial products who are also advisors (direct sales) are also required to ensure that fees for advice/intermediation are cost-effective,

---

[278] In determining which products should be covered by the ban, the Minister of Finance considered both (i) product complexity and (ii) the intensity of competition in the market for products. If a product was found to be subject to strong competition among providers, and consumers were found to have a good understanding of these products and awareness of there being multiple providers, the product was excluded from the ban. As a result, while motor vehicle and content and liability insurance are excluded from the ban, life insurance and funeral insurance are not.

[279] The key elements of the reforms are discussed in a report by Oxera Consulting, "Regulating remuneration systems: effective distribution of financial products", January 2015, at pages 24 to 29, http://www.oxera.com/getmedia/c28539cd-c6dc-42e4-9940-a624b0ff47ea/Remuneration-systems_Final-report_Jan2015.pdf.aspx?ext=.pdf.

and that they do not fall below the direct cost of providing the advice/arranging the intermediation.

- **Remuneration transparency**: Advisors must prepare a summary disclosure document which presents:

    - Information on the fees they charge (for an average customer);
    - The type and scope of their advice; and
    - The costs they incur.

    The document must be provided to investors prior to a transaction and is intended to allow investors to more easily compare costs and the scope of advice across different advisors.

- **Knowledge and experience test for execution only**: Consumers who declare their intention to purchase execution-only financial services must first pass a knowledge and experience test to show they have sufficient knowledge and experience to purchase financial services execution-only.[280]

iii. Impacts

During the 2009-2013 period, various related pieces of regulation were implemented in Netherlands, which makes it challenging to separate the effects of the ban and other pieces of regulation. The market for financial advice appears to have consolidated over recent years. This development cannot however necessarily be attributed to the ban on commissions as the trend towards consolidation had already begun before implementation of the ban. A full assessment of the impact of the ban is expected to be undertaken in the first half of 2017. Anecdotal evidence to date suggests that:

- the ban may have caused a reduction in fees for advice; and

- consumers may be somewhat reluctant to pay for advice, and may be purchasing less advice. Evidence in both mortgages and annuities suggests that consumers are opting for execution-only more frequently.

8. Germany – Strengthening Investor Protection Act and Fee-Based Financial Advice Act

In the wake of the 2007-2008 financial crisis, the German Federal Financial Supervisory Authority (*Bundesanstalt für Finanzdienstleistungsaufsicht*, or **BaFin**), introduced a series of reforms aimed at improving the quality of financial advice that retail consumers receive. Specifically, the Act relating to Strengthening Investor Protection and Improving the

[280] The AFM has indicated that, while it allows consumers to purchase financial products without purchasing financial advice (execution-only), it believes that such advice should be recommended to most consumers, particularly if the financial products are complex. In response to concerns that requiring consumers to pay for advice could lead to an unwarranted increased demand for execution-only products, the AFM introduced a knowledge and experience test. It is unclear how the AFM is enforcing this requirement.

Functionality of the Capital Market (**Strengthening Investor Protection Act**) became effective in November 2012. This reform was followed by the Act on the Promotion and Regulation of Fee-Based Investment Advice regarding Financial Instruments (**Fee-Based Investment Advice Act**), which came into force in August 2014.

i. Scope of the regulation

The new rules aim to improve the quality of advice by increasing advisor monitoring and advisor qualifications, as well as increasing the transparency of fees and commissions paid for investment advice. [281]

ii. Overview of the regulation

The Strengthening Investor Protection Act contained the following three key provisions targeting financial advice:

- **Product information sheet**: Financial advisors must provide their clients with a short product information sheet for each investment product advised to purchase. The product information sheet should contain all the information required for an investor to make an informed comparison across financial instruments, including the nature of the recommended financial instrument, how it works, and its associated costs and risks;

- **Increased advisor monitoring**: Institutions must disclose to BaFin the individual employees who provide financial advice to clients and all complaints lodged against an advisor based on the advice provided. With this information, BaFin created a database to monitor and respond to abuses;

- **Increased advisor qualifications**: Financial institutions must ensure that their advisors have sufficient expertise to provide financial advice. In particular, all advisors must have expertise in contract law and securities law and be knowledgeable about the functioning, risks, and costs of the financial instruments on which they advise.

Commission-based investment advice is the predominant model in the German market. BaFin found that although advisors are legally obligated to disclose to clients any inducements received from product providers or issuers of financial instruments, many clients remain unaware of that conflict. The Fee-Based Financial Advice Act was introduced with the aim of increasing transparency about advisor compensation and promoting non-conflicted advice. The regulation introduced "fee-based investment advice" as a legally protected designation and imposed specific restrictions on those seeking to become fee-only advisors.

---

[281] Additional information is available here: https://www.bafin.de/SharedDocs/Veroeffentlichungen/EN/Fachartikel/2014/fa_bj_1407_honorar-anlageberatung_en.html and in a report by RAND, "Financial Advice Markets: a cross-country comparison", Jeremy Burke, Angela A. Hung, October 2015, at pages 14 to 16, http://www.rand.org/pubs/research_reports/RR1269.html.

In order to designate their services as "fee-based investment advice", financial institutions must register with BaFin by submitting an audit certificate establishing that their advisors meet the following requirements:

- **Remunerated only by the client**: To promote non-conflicted financial advice, fee-only financial advisors must receive remuneration directly from their clients and may not receive inducements from third parties;[282]
- **Adequate range of offered financial products:** The range of offerings which the advisor's recommendations are based on must be sufficiently diversified with regards to providers and issuers of financial instruments. If associated with a product provider, financial advisors must ensure that their range of financial products is large enough to provide their clients with suitable recommendations. Fee-based investment advisors are prohibited from offering only financial instruments from sellers or issuers who are closely affiliated with the advisor's investment firm or with which they are otherwise economically linked. In all cases, the advice provided must be market-oriented;
- **Disclosure of manufacturer affiliation**: If affiliated with a product manufacturer, financial advisors must disclose that affiliation to their clients;
- **Functionality and organizational separation**: Financial institutions providing fee-based investment advice must segregate fee-only advisors from conventional advisors to help ensure that fee-based investment advice is not influenced by commissions-based investment advice. In addition, firms are preventing from setting sales targets for their fee-only advisors that may conflict with the interests of clients.

To promote and ensure access to the new legally protected "fee-based advisors", BaFin created a publicly available registry of certified fee-only advisors for German investors to consult.

iii. Impacts

The specific impacts of the reforms are unknown at this time.

9. Sweden – Proposal to ban commissions in the financial industry

On February 3, 2016, *Finansinspektionen*, the Swedish financial supervisory authority (**FI**), published a report on its investigations and research on how to improve the Swedish savings market.[283] FI witnessed problems on the savings market that are due to the conflicts of interests that arise when advisors and intermediaries receive payments from the product provider in the form of commissions. FI notes that the size of these commissions varies a significantly

[282] When neither the recommended financial instrument nor a comparable suitable one is available free of commission, the fee-based investment advisor can make the recommendation and any commissions received must be passed on to the client in full immediately after they are received.

[283] Finansinpektionen – *A Necessary Step for a Better Savings Market*, February 3 2016, http://www.fi.se/upload/90_English/20_Publications/10_Reports/2016/battre_sparandemarknad_engNY.pdf

depending on the product and the firm, which gives rise to a conflict of interest that is very difficult to manage. Their investigations showed that funds that are sold through advisors have higher fees than those sold through, for example, fund trading platforms. FI states that the current rules regarding the management of conflicts of interest as well as the self-regulation initiatives of the financial advisory industry were insufficient to tackle the identified issues and proposed to impose a ban on all types of commissions.

i. Scope of the proposal

FI proposed to ban all commissions for investment advice, portfolio management, as well as for life insurance with an investment component, as a necessary step towards a better functioning savings market even if such a ban would not solve all the problems facing Swedish savers.

ii. Overview of the proposal

The Swedish authority stated its reasons behind its proposal and tackled the concerns voiced about a ban of commissions and its possible consequences. Some of its conclusions are as follows:

- **Market failure**: Consumers in the savings market are at an information disadvantage in relation to the firms that offer financial services and products. They are unable to judge the quality or price of products and services which prevents them from influencing the market. Financial advice today exacerbates consumers' information disadvantage because it is influenced by the size of commissions paid by producers instead of the needs of the consumer.

- **Harming competition**: There are concerns that a commission ban could harm competition in the advisory market by favouring large banks. On the contrary, FI finds that a ban would be a necessary step to improve competition by forcing independent advisors to offer truly independent advice and to challenge the banks' dominance on the advisory market.

- **Major industry adjustments**: A commission ban would entail major adjustments and transition costs for the Swedish financial industry. With transparent pricing, firms providing financial advice will need to demonstrate what value they are adding whereas product providers that pay high commissions to get their products onto the market will instead have to compete on pricing and quality. FI believes this will lead to simplified advisory services and an increased range of lower-fee products and argues that the gains from a better functioning savings market will outweigh the transition costs on the long term.

- **Advice gap**: With respect to concerns that a commission ban would potentially cause firms to no longer offer advice and result in a shortage in the supply of advisory services to consumers with modest assets, FI finds no empirical proof that this would be the case. FI also notes that to argue against a ban on commissions on the basis that consumers won't be willing to pay a price which they have always been paying, but which is now clearly visible, is not a good argument. In FI's view, clear pricing creates possibilities for

> consumers to influence the supply of advisory services. If advice, as it looks today, is perceived to be expensive in relation to the value it provides, there is an opportunity for other types of advisory services to emerge – services that are more cost-efficient and adapted to consumers' willingness to pay. Accordingly, FI finds that transparent pricing for advice can lead to simplified advisory services that are more adapted to consumers' needs.

On May 24, 2016, Sweden's minister of Financial and Consumer Affairs communicated that the government will be proposing legislation in response to the EU directives such as MiFID II and the Insurance Distribution Directive, but that the government would not introduce a general ban on third party remuneration or commissions at this stage.[284]

[284] Jonathan Boyd, "Swedish government proposes not to ban commission-led sales", *Investment Europe*, (May 24, 2016), http://www.investmenteurope.net/regions/swedendenmarkfinlandnorway/swedish-government-proposes-not-ban-commission-led-sales/

APPENDIX D
SUMMARY OF CONSULTATION QUESTIONS

Part 2

1. Do you agree with the issues described in this Part? Why or why not?

2. Are there other significant issues or harms related to embedded commissions? Please provide data to support your argument where possible.

3. Are there significant benefits to embedded commissions such as access to advice, efficiency and cost effectiveness of business models, and heightened competition that may outweigh the issues or harms of embedded commissions in some or all circumstances? Please provide data to support your argument where possible.

Part 3

4. For each of the following investment products, whether sold under a prospectus or in the exempt market under a prospectus exemption:

    - mutual fund
    - non-redeemable investment fund
    - structured note

    should the product be subject to the discontinuation of embedded commissions? If not:

    a. What would be the policy rationale for excluding it?
    b. What would be the risk of regulatory arbitrage occurring in the exempt market if embedded commissions were discontinued for the product only when sold under prospectus?

5. Are there specific types of mutual funds, non-redeemable investment funds or structured notes that should not be subject to the discontinuation of embedded commissions? Why?

6. Are there other types of investment products that should be subject to the discontinuation of embedded commissions? Why?

7. Do you agree with the discontinuation of all payments made by persons or companies other than the investor in connection with the purchase or continued ownership of an investment fund security or structured note? Why or why not?

8. Are there other fees or payments that we should consider discontinuing in connection with the purchase or continued ownership of an investment fund security or structured note, including:
    a. the payment of money and the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105;

b. referral fees; and
c. underwriting commissions

Why? What is the risk and magnitude of regulatory arbitrage through these types of fees and commissions?

9. If payments and non-monetary benefits to dealers and representatives for marketing and educational practices under Part 5 of NI 81-105 are maintained further to the discontinuation of embedded commissions, should we change the scope of those payments and benefits in any way? If so, why?

10. With respect to internal transfer payments:

    a. How effective is NI 81-105 in regulating payments within integrated financial service providers such that there is a level playing field for proprietary funds and third party funds?

    b. Should internal transfer payments to dealers within integrated financial service providers that are tied to an investor's purchase or continued ownership of an investment fund security or structured note be discontinued? Why or why not? To what extent do integrated financial service providers directly or indirectly provide internal transfer payments to their affiliated dealers and their representatives to incent the distribution of their products?

    c. Are there types of internal transfer payments that are not tied to an investor's purchase or continued ownership of an investment fund security or structured note that should be discontinued?

11. If we were to discontinue embedded commissions, please comment on whether we should allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf.

<u>Part 4</u>

Addressing the issues

12. Based on a consideration of the data and evidence provided in this Part, would a proposal to discontinue embedded commissions address the three key investor protection and market efficiency issues discussed in Part 2?

13. Are there other ways in which the CSA could address these issues that could be introduced in conjunction with, or separate from, the discontinuation of embedded commissions?

14. Are there other conflicts of interest that could emerge following a transition to direct pay arrangements that would not be addressed in the current securities regulation framework?

Change in investor experience and outcomes

15. What effect do you think the removal of embedded commissions will have on investor experience and outcomes? In particular:

    - Will investors receive advice and financial services that are more aligned with the fees they pay?
    - What effect will the proposal have on the growth of automated advice? Is this likely to be beneficial to investors?
    - Is discretionary advice likely to increase in Canada as we have seen in the other markets that have transitioned away from embedded commissions and, if so, would this shift be positive or negative for investors?
    - What effect will the proposal have on the growth of the online/discount brokerage channel and cost of fund products offered in this channel? Is this likely to be beneficial to investors?
    - What effect will the proposal have on the cost and scope of advice provided to specific investor segments?

16. What types of payment arrangements are likely to result if this proposal is adopted? In particular:

    - Would the payment arrangements offered by dealers to investors differ based on investor segment? If so, how and why?

17. Do you think this proposal will lead to an advice gap? In particular:

    - Which segments of the market are likely to be affected? Please consider segmentation by wealth, geography (size and location of community e.g. remote, small, medium, large), age, technological sophistication, the level of fund ownership across households, etc.
    - Do you agree with our definition of an advice gap?
    - Should we differentiate between an advice gap for face-to-face advice and an advice gap generally?
    - What types of advice or services currently provided today would be most affected by the proposal?
    - Are there any potential interactions between this proposal, existing reforms such as CRM2 and other potential reforms such as CSA CP 33-404 that may affect the size of any potential advice gap?
    - How could a potential advice gap, face-to-face advice gap or financial service gap be mitigated?
    - Do you think that online advice could mitigate an advice gap? If so, how?
    - Do you think that the significant market share of deposit-taker owned and insurer-owned dealers in fund distribution in Canada will affect the size or likelihood of an advice gap to develop?

Industry change independent of regulatory response to discontinue embedded commissions

18. Given some of the changes we have seen in the industry over the past few years (fee reductions, introduction of DIY series, streamlining of fund series, automatic fee reductions increasing access to fee-based options etc.), what is the likelihood that the fund industry will transition away from embedded commissions without regulatory action? In particular:

    - Will the industry continue to transition away from embedded commissions if the CSA does not move forward with the proposal?

19. How accurate is Figure 8 regarding the purchase options available to fund investors by channel, account size and firm type? In particular:

    - Do you see payment options and business models evolving at present?
    - How are they likely to change over time if the CSA were to choose not to move forward with the proposal?

20. We note that the distribution of fee-based series is still relatively limited in Canada versus other markets. Are there obstacles (structural, operational, regulatory, investor demand, etc.) specific to Canada limiting the use of fee-based series by dealers?

Potential impact on competition and market structure

21. Please describe how discontinuing embedded commissions will affect competition and market structure and whether you agree with the analysis set out in Part 4? In particular:

    - Do you think the proposal will have an impact on the level of industry consolidation or integration? What about with respect to the concentration of mass-market investor assets held in investment products managed by deposit-taker owned firms?
    - What are the likely impacts on investor outcomes and market efficiency of any potential consolidation?
    - What opportunities and what challenges do you think the proposal would introduce for specific industry stakeholder groups?
        - Independent dealers?
        - Independent fund manufacturers?
        - Integrated financial service providers?
        - Mutual fund dealers?
        - IIROC dealers?
        - Online/discount brokers?
    - What is the likelihood and magnitude of regulatory arbitrage across similar financial products such as segregated funds and deposit-taker products?
    - What would be the impact on dually-licensed mutual fund dealers and insurance agents?
    - Will the proposal lead new, lower-cost entrants to the market? Why and how?
    - Does the interaction between this proposal and the proposals set out in CSA CP 33-404 change your responses to the questions above and, if so, how?

- Will a transition away from embedded commissions reduce fund series and fee complexity, as we have contemplated?
- Do integrated financial service providers have an advantage in terms of their ability to cross-sell and cross-subsidize across business lines? If so, how?
- What are the potential effects on competition of the rise in online advice? Are these effects likely to be large and positive?

22. What impact will the proposal have on back office service processes at the investment fund manager or at the fund dealer? In particular:

    - Is there any specific operational or technological impact that we should take into consideration?

23. The payment of embedded commissions requires the dealer and the investment fund manager to implement controls and oversight (with associated compliance costs) in order to mitigate the inherent conflicts of interest today.

    - Would the transition to direct pay arrangements alleviate the need for some of these controls and oversight?
    - To what extent, if any, does the use of direct pay arrangements by representatives today (e.g. when a representative provides services under a fee-based arrangement) alleviate the need for some of these controls and oversight?

24. Embedded commissions, especially trailing commissions, provide a steady source of revenue for dealers and their representatives. If embedded commissions were discontinued, would dealers be able to compensate for the loss of this revenue with direct pay arrangements?

25. Aside from commission grids and salaries, what other approaches to representative compensation might dealers use if we were to discontinue embedded commissions? How are these approaches likely to change over time?

26. What impact will the proposal have on representatives in the industry? In particular, what impact will the proposal have on the:
    - career path;
    - attractiveness of the job;
    - typical profile of individuals attracted to the career;
    - recruitment; and
    - relative attractiveness of careers in competing financial service business lines?

<u>Part 5</u>

27. How practicable are the mitigation measures discussed and how effective would these measures be at assuring:
    - access to advice for investors,
    - choice of payment arrangements for all investor segments, and
    - a level playing field amongst competing investment products?

28. What other measures should the CSA consider to mitigate the above unintended consequences?

29. Other than the potential impacts we have identified in Part 4, what other potential unintended consequences, including operational impacts and tax consequences, may arise for fund industry stakeholders and investors further to the discontinuation of embedded commissions? In particular:

    - Would there be a negative tax impact to investors associated with their payment of dealer compensation under direct pay arrangements? In particular, would the investor's payment of dealer compensation through periodic fund redemptions facilitated by the investment fund manager attract tax consequences? Please explain.

    - To the extent a transition to direct pay arrangements results in the rationalization of fund series, could this rationalization attract negative tax consequences for investors?

    - What, if any, measures, regulatory or otherwise, could assist in mitigating potential operational and tax impacts?

30. With respect to the loss of a form of cross-subsidy from high net worth investors to lower-wealth investors in a fund further to a transition to direct pay arrangements,

    - to what extent (please quantify where possible) would the loss of this cross-subsidy increase the cost of providing advice and services to lower-wealth fund investors under direct pay arrangements?;

    - does the existence of this form of cross-subsidy suggest that high net worth fund investors may be indirectly paying fees that are not aligned with the services they are receiving (i.e. do the fees they pay exceed the actual cost of the services and advice they receive?); and

    - what measures may mitigate the potential effects on dealers, representatives and investors from the loss of the cross-subsidy?

31. What measures could fund industry participants proactively take to mitigate the unintended consequences that may stem from the discontinuation of embedded commissions?

32. For each transition option, please tell us how your business (investment fund manager or dealer) would have to operationally change or restructure in terms of systems and processes and the related cost implications. Where possible, please provide data on the estimated costs.
    - Are there unique costs or challenges to specific businesses?
    - What transition period would be appropriate?
    - Should existing redemption schedules for DSC and low-load purchase options be maintained until the redemption schedule is completed, or discontinued at the Transition Date?

33. Which transition option would you prefer? Why? Are there alternative transition options that we should consider?

34. As discussed in Appendix B, the CSA did not retain the option of capping embedded commissions, either as a stand-alone solution to the key issues discussed in Part 2 or as an interim step toward an eventual discontinuation of embedded commissions. Should the CSA further consider using a fee cap as a transition measure? Why?

Part 6

35. Please explain whether you think each of the initiatives discussed above will, either alone or in combination:

    - address the three investor protection and market efficiency issues and their sub-issues identified in Part 2; and

    - address or not address any additional harms or issues that you have identified.

36. Are there alternative options or measures, whether regulatory or market-led, that could successfully address the three investor protection and market efficiency issues and their sub-issues identified in Part 2. If so, please explain.

Subject: Embedded fees

My name is Debbie Hartzman, and I am a Certified Financial Planner, with Professional Investments, Kingston Ontario.

I have a client base of approximately 500 families in the eastern Ontario regions. I started my career in 1995, and have been active in the financial planning community since then. On the board of Advocis, on Financial Planning Standards council working group and the CFP exam board.

Over the passed few years I have surveyed every client I have come in contact with as to whether or not they would be in favour of paying out right for my services, I have explained the issues of embedded fees, and not one has agreed that they would like to pay me directly. The the overwhelming indication is that they want to be informed and would like choices but they do not want to billed independently of their investments.

Because I service a niche market, clients going through separation and divorce, I have to co-operate and liase with the legal and accounting professionals. I can not tell you how many times I have had one of these professionals tell me that they can not help the client in the way I am suggesting because they have no way of billing for that service. Conversely, I have clients contact me first because they know they are not on the clock with me, and I will help them as much as I can, but will refer them back to the appropriate professionals if it is outside my area of expertise.

If we are forced to bill for our time and services much of what we presently do to service clients will have to fall by the way side as clients will not be able to pay for services. Much like when I suggest a client have a "Will" written, the first thing they say, is "how much is this going to cost me"?

I implore you to listen to the people who engage in our services and hear what they say. Disclosure for sure, separate billed payments are not preferred and will solve no problem. Give the clients the power to choose. In the past two years, there have been shift towards, lower fees, no dsc, full disclosure of fees and more and more compliance. Give these measures a time to work and then see if in fact there are further requirements needed. Change for no good reason does not serve the clients you are trying to protect. In the long run, studies show that a ban on fees, to be paid directly back fires on the very people you say you are trying to protect.

I for one would have to stop servicing the small client who couldn't afford to pay my fees. They would be relegated to deal with providers who do not offer the level of service that I do, regardless of how much money they have invested all my clients are treated with dignity and respect.

I am not the only advisor who uses our trailing commissions to subsidize the service for our smaller client who need us as much or more than our higher net worth client. Don't make a mistake and hurt the very public you say you are trying is to protect. This is Canada, not the US, or the UK, learn from their mistakes.

Regards

Debbie Hartzman.CFP.CLU.CDFA.TEP.RRC

Dear Sir/Madam

Re - CSA Consulting Paper 81-408 (10 January 2017)

Regarding the aforementioned consulting paper, it is clear CSA intends to transition away from all forms of "trailing/embedded commissions", even the reduced ones of 25bps currently available on Series D mutual funds. Page 137 indicates CSA does not think it is able to "compel" Fund Managers to make Series D Mutual Funds available. Well, you don't have to. As Series D Funds are already in the marketplace, the demand from DIY investors, who invest through discount. Brokerage accounts, will have the effect of forcing the brokerage companies to make these funds available, or they will risk loosing clients/assets to their competitors.

Generally speaking DIY investors have "chosen" to make their own decisions and are quite content paying a trailer fee of 25bps in order to secure access to Series D Mutual funds at a cost they deem reasonable for the services they get from their discount broker (including, but not limited to, providing up to date account statements, confirmations of transactions, year end summary of account activities, tax documents, etc, etc). Rather than telling DIY investors "what they can get", how about CSA asking DIY investors "what do you want". This "Alternative Perspective" would a refreshing breath of fresh air for DIY investors, who neither want, or need, any form of hand holding.

Looking forward to your response –

Best Regards
Nick Carroll.

January 11, 2017

Dear Sir or Madam:

I am writing in response to the recent consultation paper released by the Canadian Securities Administrators regarding the banning of commissions in the financial services industry.

I joined the financial services industry in 2009 after completing a degree in business economics from the University of Saskatchewan. Following this, I completed the Certified Financial Planner designation and now run a small, independent financial service business along side my father and brother. Our business focuses on long- term relationships with our clients helping them navigate any number of financial decisions over their lifetime. Decisions they want to make prudently by seeking out objective counsel.

We have received an overwhelmingly positive response on our approach that focuses on a client's overall financial situation, goals and objectives first and then helps them implement a financial plan based on that client's wants and needs.

Since becoming involved in the industry it has never sat well with me the way our industry portrays itself as a true profession that is essential to Canadians along with lawyers, doctors, accountants, engineers etc. While at the same time operating under a compensation model that is in direct conflict with the ability to objectively perform this important service.

I do not buy the argument against the banning of commissions that it will result in less access to advice. In fact, I have found while attending various meetings and symposiums across country that the misinformation, especially flowing from other jurisdictions experiences such as the UK and Australia, to be based in fear and reminds me more of simply "protecting the status quo."

In our business we have transitioned to operating with only fee-based investment accounts where we receive no third party commissions. This has not precluded us from working with clients from all different income and asset levels and has freed our minds in the ability to give our clients the best possible financial advice and direction.

802-4010 PASQUA STREET REGINA.SK S4S 7B9 // P. 306.525.4707 // F. 306.525.4705
WWW.TCMFINANCIAL.CA

For example, a client with $50,000 to invest, in my mind, is either going to pay me (or our dealer) 1% directly through a fee-based account –or- I am going to receive a 1% trailer from a product provider. I do not see any difference in the end other than the direct fee is more transparent and must be negotiated and presented to the client just like they would expect engaging with any other professional service.

Will this change the way advisers and planners run their business? Yes. Attract clients? Yes. Will this change mean we have to re-evaluate how we are going to compete for business over the next 10-20 years? Yes. But it is not the responsibility of a regulator to make it easy for businesses to operate but instead need to create a fair and ethical environment, which I believe the CSA is trying to achieve with these consultations.

In closing I believe the banning of commissions in Canada along with other reforms such as raising education and proficiency standards will enhance the entire financial services industry in the long term.

Sincerely,

Taylor Hewson CFP®

Good afternoon,

Please see my comments below regarding my concerns about Canadians access to affordable financial advice and the Canadian Securities Administrators (CSA) Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions as directed to do so by the Honourable Gordon S. Wyant, Q.C. – Minister Of Justice & Attorney General of Saskatchewan.

Tyler J. Dickie

From: Dickie, Tyler
Sent: Wednesday, January 11, 2017 3:24 PM
To: 'Ralph.Goodale@PARL.GC.ca'
Subject: Please protect Canadians access to affordable financial advice.

I am writing to you with concern about possible changes in the financial advice industry. It is my understanding that these changes will require that consumers pay an upfront fee for financial advice. Right now, all consumers have a choice whether or not to pay a commission. This type of change will help the wrong people and hurt the average person who depends on affordable, quality financial advice.

I believe that Canadians should continue to have a choice in how they pay for financial advice – whether through commissions or upfront fees. These proposed changes mean that:

- Most Canadians may lose access to affordable financial advice;
- As a financial advisor, I won't be able to keep the costs the same;
- The current regulations that put consumers at risk will not be addressed;
- The quality of advice people receive will still not be ensured;
- Your constituents will have little choice about who helps them manage their finances into the future.

The regulatory bodies who are proposing this change believe that removing choice is in consumers best interests. Limiting their access to financial advice does not protect them and most of them would prefer not to have anyone dictate how they interact with me as their financial advisor.

Rather than limiting their access to financial advice, the focus should be on maintaining standards by creating a profession for all financial advisors. This will make the industry stronger and protect all investors.

Financial advisors like myself are part of the community and the advice we provide not only creates wealth but also makes people feel more secure. Your constituents deserve nothing less.

I would ask you to make every effort to raise this issue with the minister responsible for the securities regulator as soon as possible to ensure that the public voice is reflected in these types of decisions.

Thank you,

Tyler J. Dickie, CFP® , RRC®
Financial Consultant

I wish to include my comments with respect to the CSA Consultation Paper 81-408

As a currently licensed life and health insurance broker and a formerly licensed IIROC investment advisor and exempt market advisor, I fully agree that commissions as such should be banned and the sooner the better. By commissions I mean front and back end load mutual fund commissions, not trailer fees. Deferred and up-front sales charges clearly are not in the best interests of the client as they effectively lock the client into a particular type of investment for years. The only person who benefits from this is the sales person.

Trailer fees, as long as they are fully disclosed, are really no different from charging a percentage of assets under management, so I am not sure why one would ban one without banning the other. Banning trailer fees on mutual funds while not banning a charge via a percentage of assets under management would unfairly penalize those who sell and promote mutual funds. If you are going to ban trailer fees, you need to ban charging via percentage of assets under management too.

Have you considered putting a cap on trailer fees, such as 1% of assets under management?

Personally, I think that the best system for all financial planning would be to charge by the hour for services rendered, like lawyers and accountants do. The only problem with that is that very few people would be willing to write a cheque to a financial planner.

Perhaps a system that requires that financial planners be paid a salary, rather than straight commission and living off trailer fees, might be a more client-centric approach. Sort of like Best Buy when they took over Future Shop. Best Buy does not pay commissions, whereas Future Shop was on straight commission. Best Buy is the survivor.

Under the current system, all of the rewards are based on assets under management (AUM). If advisors are rewarded for AUM, then how can we realistically expect 100% of them to provide financial planning services that are holistic and in the best interests of the client? I'm reminded of an article I read during my MBA studies "On the folly of rewarding for A while hoping for B" by Steven Kerr. The title is self-explanatory as it relates to the misaligned reward system in the financial services industry.

Finally, I think that the language within the industry needs to change. Financial services companies talk about "sales", "production", and "AUM", instead of client satisfaction and enhanced client outcomes. Rewards should go to those who provide excellent advice that is in the best interests of the client, not to the best salespeople. Idealistic perhaps, but that should be the goal.

Banning commissions would and should lead to having fewer so-called "financial advisors" out there. With fewer, better advisors, who are paid based on the value they add, the reputation of the industry and the profession would be improved.

Sincerely,

Tim Weichel, MBA

Dear Sir/Madam,

I am an experienced investment advisor and my firm's model is the imbedded fee model. So we are paid directly by the mutual fund companies, monthly.

I have spent the last two years explaining to my clients how we are paid and why we are paid (and what I use my compensation for: like paying my rent, my assistants salary, my license costs, etc…). My most important and largest clients have been explained the fees many times. I haven't had one complaint about paying too much.

It has been my experience that the embedded model works best for most people. If we remove imbedded fees the small clients will have to pay much more. For instance I just booked an appointment with a client that has $7K with me - basically I net $50/year. I would have to either give that client up or charge them more to deal with me. Being paid directly from the fund company allows me to continue to service this client - if we change that, these types of clients would get no service.

If you ask the client, they prefer imbedded fees. I carefully explain to them that their returns are after fees. If you ask them (and I do) - would you prefer the fess come from your account - they always say no. If you look at brokerage fees (many have un-imbedded fees that are much higher than 1%, especially for the average sized client) - the fees eat away at the returns. Many of the dividends coming into the account are consumed by the fee, especially if the client has a smaller account and is paying more. Many brokerage accounts that I look at have substituted ETF's and Index Funds and then upped their un-imbedded "trailer fee" to 1.5% from 1%. They do this because they are under pressure from the bank dealer to pay more for overhead costs and bank profit. If you count the 1.5% and the ETF cost - this comes very close to what a mutual fund charges. No mutual fund pays a trailer fee of more than 1%.

I feel very strongly that explaining the fee to the client is enough. They understand what they are paying, in dollars, and we print it on their statement now, so if they chose to they can move their funds elsewhere (perhaps at a negotiated rate). Most like the service they get from us, we don't gouge, we are fair (in my opinion).

Un-imbedding the fee I believe will lead to a different type of excess. One where you will start to charge the small client a larger fee. Most of my larger clients started small and I helped them grow their account to the large size it is today. Compensation is one of the reasons I have spent the many years learning that I have. It isn't easy to make money for people. We have to temper expectations when things are good, and push people to do the right thing when things are down. We are paid well but I believe most of us deserve to be. We have a unique skill that adds value.

Sincerely,

Kevin Hayes
CFP Professional

I would like to share my views from over 25 years working in the financial advisory business, about the proposed move away from embedded trailer fees. On the surface I have no objection as most of my advisory practice is based on the 1% service fee I receive from the fund companies I deal with. I do not now charge up front commissions at all, nor do I use DSC funds. There are trends I have seen however, that worry me.

I will first preface by saying that I originally got into this business to help people. It didn't matter to me whether they had a lot of money, just that they wanted to do the best with their money, and become as financially independent as they could, given their personal gifts. Of course back then it was quite acceptable to put many people saving for long term into DSC funds. The increased income to my business from DSC funds allowed me to keep those smaller clients and give them the help that they needed. The DSC fees also served to deter them from dipping into their retirement savings for short term needs such as vacations. Since I no longer use DSC funds, I have had to send some clients away. I simply can't afford to keep them due to the rising costs of doing business.

Today, my practice focuses on higher net worth clients because I am running my practice on just service fees. Fee disclosure is not the issue. My clients know the fees they pay. I know my clients value the advice I give them, and will pay for what I do for them (I already have some clients in fee for service model).

I think that ensuring the service fees are the same across all investment funds would be beneficial for all clients, and ensure that there is no alternative reason for advisors to choose a specific investment for clients. By ensuring that clients know how MERs and service fees work, through the CRM2 initiative has gone a long way to full disclosure to clients. Flat service fees would ensure advisors are not choosing funds so that they get a higher commission rate. The amount of embedded service fees I receive are based on the performance of the investments I choose for my clients. It is in both my and my client's best interest to choose the best portfolio managers I can find. Remember that those service fees have to pay for my all of my own office expenses, my staff salaries and leave something for me for compensation for the work I do.

And those fees pay for a lot of services for my clients. I work with their other professionals such as accountants and lawyers for tax planning and estate planning. I do retirement projections, put together family protection plans, and work with small business owners to make the best financial decisions for them, their businesses and their families. Ongoing research goes without saying. But most of all, I keep my client's emotions from blowing up their financial plans. So many times people have reacted to either market or life events that could have totally derailed them financially. I have clearly explained the possible outcomes, thereby helping them realize that an alternate decision is a much sounder one. My level of knowledge over 25 years ensures that my clients are way ahead financially, than if they didn't have an advisor. Keep in mind that the majority of people have no education in finances, so they desperately need good advice.

There is more of a conflict of interest at the banks than at any independent dealer. The banks have a vested interest to encourage people to borrow money and use credit when it is not in their best interests to do so. I have heard some really terrible advice coming from that quarter. I am really sick and tired of seeing the banks get away with the lies they tell people. The rules don't seem to apply to them or the insurance companies. There is no level playing field when it comes to these two other streams of business.

I am at the end of my career, but it doesn't mean I don't care about the people I serve, and the future of Canadians as a whole. The end result of banning service fees will be that only the wealthy will get good and thorough financial advice and planning, because they are the only ones who will be able to afford it. Remember that most people have no understanding of the true value of getting professional advice. (most high net worth people on the other hand do know) All that the average person will see is the upfront fee they pay, with no real understanding of the value they are getting. So, like so many aspects of our country, the rich will get richer, the poor will get poorer. Not the kind of country that most Canadians want, I am sure. I can't see how banning embedded service fees, which are fully disclosed to clients now on their statements, in dollar terms, will help them in the long run.

If you as regulators would spend your time and resources to educate all potential investors about how the whole system actually works, so that they can make truly informed decisions, the country would be so much further ahead. By educating people you protect them from abuse so that things like banning service fees, become irrelevant. These fees are being fully disclosed on client statements now anyway.

I urge you to listen to those of us on the ground who are independent advisors, with our client's best interests at heart. I want you to really understand what sitting in my chair means. Thank you for receiving my submission and my point of view.

Kay Crawford, PFP

I am an individual investor and I am completely perplexed as to why the regulators have not banned embedded fees once and for all. It is not a complicated issue and it strikes me the Regulators are being cowed by the Mutual Fund sellers who love to refer to themselves as “financial advisors”. Because I am interested I educated myself about trailer fees and back end loads and front end loads etc. many years ago but amongst my friends there are almost none who recognize how much they are paying. Yes, I know the new regulations require the fees be shown in dollar amounts as well as percentages on the monthly or quarterly statements. The sad truth is that most people and particularly those who are financially unsophisticated or uneducated don’t really look at the statements or if they do it is a cursory glance at best. There are members of my book club who insist they have mutual funds with their bank and they pay no fees at all - give me a break!!

How long do you intend to study the issue and when can I anticipate some movement on this matter. A response would be appreciated.

Commentaires de Yves David [redacted]

À l'âge de 14 ans j'ai demandé à mon père quoi faire avec mes épargnes. Il m'a présenté son agent d'assurance-vie.

En 1979, célibataire, j'économisais 110$ par mois dans 3 polices car personne n'avait pris le temps de m'éduquer financièrement.

En 1989, travaillant aux États-Unis, j'ai rencontré une compagnie dédiée à la classe moyenne et j'ai décidé de revenir ici aider mes proches et leur proches à investir dans les fonds communs.

Je disais que je serais là pour les gens qui avaient même de la difficulté à investir 50$ par mois. Prenant le temps de les éduquer financièrement et de développer des stratégies de protection et de désendettement.

Puis nous avons réduit le plancher à 25$ par mois.

Aujourd'hui nous dirigeons une force de distribution de près de 200 représentants qui servent 25000 clients dont le compte moyen est de 13145$.

Oui 13145$....!!!

2 exemples de mes clients personnels. Les noms sont fictifs mais les cas réels.

Jeanne qui a commencé à épargner 343$ par mois. Je l'ai accompagné à travers les soubresauts de l'économie mondiale depuis 1998. Elle m'a récemment remercier de ma patience et du fait qu'elle a maintenant plus de 500000$ en Reer.

Alex et Julie qui avait à peine 50$ par mois à investir et qui aujourd'hui ont une valeur nette de plus de 1 millions$.

Les commissions intégrées m'ont aider à servir ce marché.

Comment accepter de payer des honoraires quand on est un petit épargnant?

Comment tronconner le peu que l'on a?

De plus les frais de rachats sont un excellent outil pour inciter les gens à utiliser les fonds communs sur le long terme et à rester investi pendant les baisses du marché.

Je ne connais pas vos motivations pour considérer éliminer les commissions intégrées mais je connais les besoins de gens qui veulent avancer financièrement et qui n'ont pas les moyens de payer des honoraires.

Merci à vous de considérer ces commentaires.

EMBEDDED COMMISSIONS

Reference: CSA CONSULTATION PAPER 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS

1. I am an individual investor and have been concerned with the ongoing practice on embedded commissions for several years now. This practice obfuscates broker fees and harms investors through the conflict of interest it creates for advisors. As I have watched other countries e.g. the United States, United Kingdom and Australia ban embedded commissions it is confusing as to why this practice has not been stopped in Canada. Having reviewed the reference paper I believe that the conclusions are self-evident and support cessation of embedded commissions i.e.:

1. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors;

2. Embedded commissions limit investor awareness, understanding and control of dealer compensation costs; and

3. Embedded commissions paid generally do not align with the services provided to investors.

The evidence we have gathered to date shows that embedded commissions encourage the suboptimal behavior of fund market participants, including that of investment fund managers, dealers, representatives and fund investors, which reduces market efficiency and impairs investor outcomes

2. Your report provides factual evidence that the practice of embedded commissions is counter to investors interests and would ensure a more efficient and competitive industry. Therefore, I would like you take note of my support for the immediate elimination of embedded commissions. I would also implore you to not delay any decision based on industry self-interest and the fallacious argument that many Canadian’s will be denied investment advice because they will have to pay for it. Canadian’s have been paying too much for advice under

the current system and it is time to force the industry to compete for business in a more open market. I believe that individual investors can make appropriate choices on the selection of investment advice and what value to pay for said advice when they are faced with a level playing field and not faced with information asymmetry that is supported via embedded commissions.

3. The recent, if not glacial, implementation of CRM II is a good step for investors. I urge you eliminate embedded commissions as quickly as possible to protect and serve Canadian investors.

Sincerely,

Signed by

Alistair Harrigan Cdr (Retired) RCN BComm

Statement on behalf of myself to the Ontario Securities Commission

Hello there,

Let me tell you a little story. I recently visited with my father over the holidays. He is a smart man, retired at 54 and has an investment portfolio of over $1 Million (mostly in registered accounts) with a financial advisor for a large bank. I spoke briefly with him about the new changes coming in 2017 for advisor fees reporting (namely "CRM2") - he had no idea. When he confidently proclaimed that he only pays about %1 in advice fees, he was taken back to realise that that really accounts for over $10,000/year and immediately scheduled a meeting in the new year with his advisor to discuss possibilities of reducing his rate as a high-net-worth investor.

Here's the thing, as you can imagine as he didn't fully grasp the concept of his %1 advice fee, he had *no idea* that the trailer fees on his mutual funds (which make up more than %65 (!) of his portfolio) could be an additional hidden cost that may be greater than the advice fee he had just been taken back by.

I'm starting to worry that my father isn't the exception, but the rule. A large population of baby boomers that have continuously amassed wealth over many years and have stuck with their "down-the-street-big-bank" that they walked into 40 years ago when they started to accumulate more money than a savings account justified.

Embedded, or "trailer", fees are secretive, underreported and misalign the interests of advisors and advisees. At least when I pay 'hidden' airport upgrade, tax and fueling fees when purchasing a flight, I am told about these fees at the time I pay. Hidden trailer fees are predominantly never reported in monthly statements, despite being a serious drag on investor's pockets. This is borderline robbery and investors shouldn't have to dig through 30 pages of mutual fund pdf information packets online to find the true cost of owning a product.

I am strongly for the <u>elimination</u> of embedded fees in mutual fund products, or at least, the mandatory reporting of fees on a monthly statement in *dollars*.

The argument that it will become more difficult for investors to obtain financial advice if the fees are eliminated is absolutely **laughable**, and a desperate argument from the large fund managers and salespeople across the country that are accustomed to having their pockets filled with investors' unknown money. There are a plethora of options available today to investors including, but not limited to, low-cost index funds and ETFs, independent brokers, fee-based advice and Robo-advisors. WealthSimple, Nest Wealth, BMO SmartFolio and an abundance of others would be more than happy to take on the additional accounts (big or small) and would more than likely be better for investors.

Thank you for taking my comments into consideration,
JR Tobias (Toronto)

Friday, January 27, 2017

Good afternoon,

First, I would like to thank each one of you for your time and dedication you put into the roles you play, that help to shape the financial services industry in Canada for the better.

All of the discussion and conversations in the industry show there is much work to be done to ensure clients are served well, and that the trust they place in the industry is not placed in vain.

I am writing as one small voice in a sea of many Advisors, I am 30 years old and have had the pleasure of being in the financial services world since I was 21. This business has been a great way to support my wife and 4 kids, and be involved in a very rewarding career.

Over the last few years especially, this business is evolving quickly, In your positions, I know your quite familiar with current and coming changes. My reason for writing comes from a frustration of not knowing who it is the advisor can go to share our concerns, and comments on how our business is changing, it seems in many ways that the ones who' have so much time, and money wrapped up into the business, the ones who are at the ground level are not entitled to have an opinion. It almost seems as if regulators feel the advisor should not have the write to help shape the way their own industry evolves. Though in many ways through licenses, fees and taxes we help employ the very people who regulate us.

With that said, I very much understand the reasons for all of this change. Over my 9 short years I have seen many cases where clients were sold something, an advisor profited greatly, but the client was not better off, or worse yet, disadvantaged. Though I can't say I have done a perfect job for my clients, I do take very seriously the trust they put in us for advice that puts them and their interests first.

With the implementation of CRM2 I think it is a very healthy thing that clients see what we get paid, and the advisor insure that the client is getting value for each dollar spent.

I guess my biggest concern is the direction we are headed. It seems as if we are taking into account the practices of poor advisors and regulating everyone based on them. When I hear the discussions of what's coming next, it feels like we are trying to draft legislation that assumes that the advisor will always take advantage of the client unless regulators step in to force them be honest and care for their clients.

Well before we have ever seen if CRM2 is working we are now moving to remove embedded commissions, even though, there are many lower-middle class families who benefit greatly from this structure. Many of my clients fall into that category, and as I work to help them reach their financial goals I can honestly say for many of them, they have had more time and advice then they could afford to pay for. One thing I have never read is an article about what the industry is going to do to compensate Advisors who spend time to help families, and build them into good clients, no one is worried about how, in many cases an advisor has worked with people even though their compensation was minimal, any new advisor will have a hard time surviving in this business if he/she only served low-middle income families. I think this has been proven true in other countries who have adopted the fee-for-service only model, the smaller clients no longer receive financial advice.

Even though there are many advisors who would serve us all well to leave the business than to keep giving the business a bad name, lets not forget the studies that have clearly shown that in the final analysis people in Canada have done better with a financial advisor than without one.

One of the things that has been a huge focus is clients disclosure, now I don't know what the answer to this is, but when opening a simple TFSA feels to clients more like buying a house (as far as paperwork is concerned) I think we have to think hard on its effectiveness. Though I don't know the answer, it seems these things are serving to simply protect our dealers from lawsuits but as the burden of reading and disclosure increases I'm not sure the clients are more informed, even though we do our best to get them to ready everything carefully.

One other regulation I hear being contemplated is the idea that every product offered by a dealer needs to be understood by both advisor and branch manager. For this I would encourage you to step into our shoes, there are thousands of funds in Canada. We do our best work to comb through and find quality funds and then make sure we understand the ones we have chosen. It is almost as unreasonable to tell someone working in the Walmart electronics section that they need to understand every single product in the whole store inside and out, or they have no job. I think they would be better served knowing well the products they actually sell, and their clients would be better served as well. The cause and effect to this will again impact our clients. Dealers will no longer to be able to offer much choice, smaller boutique fund companies will close, and our clients will be left with a lot less choice to invest in. Does this really help the client? I think its great for banks or big fund companies, but not our clients who deserve choice.

The increased pressure on outside activities seems like it is becoming overreaching, in my spare time I organize a small recreational hockey team, I realized this week that I need to be compliance approved in order to offer my son and other families a more affordable option so they can play hockey. It just seems that common sense always gets sacrificed in the name of regulation. As in every business there will always be those who use their reputation, position, and authority and leverage it for their own gain, no matter how heavy the regulation people with that intent seem to find a way. I agree we need something to keep an eye on what else advisors are doing, but I would have to think there is a better balance, not every one, in fact I would guess it's a low percentage of people, who are using their volunteer positions, or religion to undermine those who trust them, so is there a way to not overburden the majority because of the minority?

Often I have heard the stat that the average age of a financial advisor in Canada is 55 years old. If I am a regulator, this is one of the biggest problems we face. What are we going to do to ensure the generation coming up can have access to financial advice. For the ethical advisor, who is not going to sell DSC funds and whole life insurance to anyone with a pulse, starting this business is very challenging. For an advisor to start, and start right, a great deal of their business will be term insurance, and front end load funds with 0% front end commission. You are all well aware of the challenge it would be to make a living off of those, especially if you're a younger advisor, working with younger families. So my question to you is, how are you encouraging younger people to get into this business? If we continue to make it more expensive and continue to increase the regulatory burden without more balance, it will be too expensive to start (it probably already is) and too much of a compliance burden to maintain. When I am retiring the question will not be “are advisors paid too much?” it will be “where can I find a financial advisor?” That to me is the issue that should keep us all up at night, because the future of any industry will be its ability to bring in and train younger people to take it over. I know a number of people in their 20’s & 30’s who entered the business, but could not afford to stay in it.

Today the average income for a financial advisor is in the neighborhood of $47,000, I am guessing many of you would not keep the jobs you have now if that is all that it paid. In fact I would further argue, since you know more than anyone the current regulation and upcoming regulation, that many of the people making these regulations would not want the responsibility put on financial advisors today if they were only going to make $47,000 per year.

As the industry continues to develop with regulation, and seeks to improve the quality of service offered by our industry, my simple request would be to bear in mind the many practices and livelihoods that are effected positively or negatively by the decisions you make.

As you all go home from work each day to your families, please keep in mind that the average advisor does the same thing. We are people trying to serve our clients with good advice, and ultimately make a living for our families. Everything you do to change our business, to make it more difficult, more expensive and less profitable effects us and our families, please keep this in mind.

At the end of the day I think our goal should be, a well informed client, who is able to make choices, instead of having a regulator making those choices for him.. An environment where ethical advisors are encouraged to grow, and regulation that assists in this. And spending more time cleaning up the industry so that the everyday advisors life is not further burdened by regulation meant for the unethical one.

I say all of these things with the utmost respect for your position, and an appreciation of what you do. As much as you do not see the business through my lense, I do not see the business through yours. The lenses of the client, regulator and advisor are all necessary in order for regulations to be effective, without all three perspectives they will not have the desired intent.

Thanks so much for taking the time to read this!

Thanks,

Ben Davies

Hello. I have been reading about the projected to change imbedded commissions for mutual funds in Canada.

I have been in the financial services industry since 1994. I am now 59 years old. I agree that an advisor needs to earn the "trailer commissions" on the block of fund clients!
As such, I run a small block,and I spend my time firstly recording the return history of all my clients in a ledger book. My role is to be the gate keeper for my clients and advise them of asset switches when the stock markets make such a move appropriate.

I am constantly in contact with my clients. I have to provide service work for my clients on things such as beneficiary changes, PAC changes, banking information or address changes, and redemptions all the time, this work I am not compensated for.

Due to my vigilance in not allowing large drops in my clients portfolio, my clients have experienced the best returns possible.

I am confused because I'm not sure when I became the bad guy. I have sat in clients homes to advise them on financial matters, including paying out death claim cheques! I was working when you guys were at home relaxing!

I will do everything I can to help in this. You have to remember, I could have been in another line of work for the last 23 years, if I was told that my very financial lively hood was going to be taken away at my age.

Please think carefully, there are lives at stack.

Yours truly,
Brad O'Morrow

À qui de droit,

Je vous transmet aujourd'hui un courriel afin de vous faire part de mon opinion concernant le fin des commissions de suivis. La fin des commissions de suivi sera néfaste pour le consommateur car tous les conseillers vont changer continuellement de compagnie et toucheront toujours une commission de placement. Le conseiller agira ainsi à tous les deux ans et ne travaillera pas pour son client. Avec les commissions de suivi, la grande partie des conseillers ne font pas ce petit manège et se concentre sur le fait de bien connaître ses produits et d'y être fidèle donc de bien conseiller ses clients.

NON À L'ABOLITION DES COMMISSIONS DE SUIVI

CSA Consultation Paper 81-408

I work in the investment industry but my submission is on behalf of all financial product consumers in Canada. Embedded commissions do create a conflict of interest. I have marketed investment products since 1993 and part of the value proposition to differentiate products was commission.

However, if you ban embedded commissions the issue of consumer choice worsens.

Here's why.

A)
Product Innovation:
Any mutual fund manufacturer that also owns a distribution channel will innovate and launch a suite of new products. These products will not have any commission.

By way of examples:

- Canadian banks will launch products at 2.00% MER and no commission. These products will be sold through the banks retail outlets via salaried employees.
- Investors Group, London Life (Freedom 55), Sun Life career agents etc will create a product at 2.00% MER and no commission. Advisors will be paid a salary and bonus to sell these products

Vertically integrated organizations will utilize a value proposition to Canadians that states "move your account to us since we don't charge any commissions". The consumer may be paying the same cost (MER) but the statement proves compelling.

B)
Fee Based Accounts:
Many of these vertically integrated organizations, especially the IIROC channel currently offer fee based accounts. They will continue to grab market share. However, most aim exclusively at the High Net Worth community not all Canadians.

C)
Independent Advice:
This channel will be decimated. Many advice channels do not offer a fee based accounts. Average Canadians will not pay for advice. Competitive forces drive this channel further into a downward spiral.

D)
Independent Portfolio Management:
Without access to distribution this channel struggles to reach Canadians and continues to shrink.

Summary Outcome:

Canadians are left with vertically integrated manufacturing, distribution and advice controlled by some 20 organizations. These organizations will market that you can purchase any product through their channel but when you leave a CIBC branch you will have purchased a CIBC product. The CIBC product is professionally managed by either employees or owned portfolio management companies. Repeat for Freedom 55 or any other surviving organization.

Independent Portfolio Management organizations who do not have a sub advisory relationship with one of the vertically integrated networks struggle to survive and this channel shrinks. Who works harder for Canadians employees or independent Portfolio Managers who want to earn your investment dollars?

Independent advice is dead

Independent portfolio management is dead

Choice is decimated.

You will own a proprietary product.

Banning of embedded commissions reduces choice and creates more conflict of interest not less.

Thanks and regards
Steve Kunzel

PS If you want to help Canadians create wealth, ask the government to eliminate tax on investment funds and create one regulator for all products, including insurance in Canada.

To whom it may concern. I have yet to see a coherent and well-articulated rationale for the outright banning of embedded commissions on mutual funds. The pervasive scrutiny applied to the financial services industry that has resulted in this ridiculous proposal seems entirely self-serving and biased.

The embedded commission is no different from the mark-up of any item for sale. For the advisor who sells mutual funds on a FEL basis, is a .00125%-.005% annual trailing commission on a $100,000 investment so egregious when compared to the 2.5% a real estate agent may earn on the sale of a property? For that matter, is the advisor who sells mutual funds on a DSC basis and receives 2.5-4.0% up front any different? Why the scrutiny on one and not the other?

To adopt the reductio ad absurdum, do I, as a consumer, not have just as much right to know what the mark-up is on the suit I buy from my retailer as I do the embedded commission I'm being charged on my mutual funds? By the same token, can we justify the mark-up on the food we buy? Shouldn't we be focusing on reducing the "embedded fees" that increase the cost to consumers on the staples of life in addition to the embedded fees we pay on our mutual funds?

Without getting into a very long-winded digression, the solution to this issue is very simple. It comes down to choice and disclosure. A free market will provide choice. And an ethical advisor will present both choice and disclosure. But the CSA wants to limit my choices. They've adopted the self-serving moral position that ending embedded commissions is the better way, with no clear evidence that the consumer will be better served.

Yet, even if they were able to offer clear evidence, the decision on whether or not to buy should always be left to the consumer. At least in a free society, it should be. Give me a choice. Let me decide what I want to buy. Don't make that decision for me. If I wish to pay more for organic food, I should have a right to do so, even if the alternative might save me more money. If I wish to buy mutual funds which come with a trailer commission or DSC option, again that should be my right. If I have the choice to buy a fund with no embedded commissions, and I feel that it will ultimately be better for me, then I can make that choice for myself. I have that choice today.

In an era where we have a growing abundance of choices thanks to a free-market, legislating what legitimate products companies can and cannot offer smacks of fascism and anti-competition. The moral argument here for limiting choice is specious at best and utterly tenuous in the light of full examination. Let us be honest with both ourselves and the public. This is strictly a PR move and nothing else. Give the consumer choice.

In the interest of full disclosure, I sell mutual funds in my practice. I do not sell funds on a DSC basis. However, I support the right of advisors who wish to run their practice on the DSC model. And I support the right of clients to purchase funds from advisors who wish to run their practice on the DSC model. Who are we to take away those rights from others simply because we don't ascribe to that model or have a moral aversion to it?

Respectfully,

Hello,

Please note my change in regards to embedded fee. These are to be added to the comments.

First of all that is a large document to go through and I would be lying if I said it was fully understood.

Please use these comments:

- trailer fees should not be paid when accounts lose money. If fact - it should refunded.
- the amount of trailers should be obviously stated on every statement (transparency)
- the amount of trailer fees paid should be on my annual statement
- total trailer fees deducted should be calculated for my whole account over time.
- trailer feels need to presented in a clear way to clients - with a signed acknowledgement - annually.

Thanks,

Victor Prasad

Harry Lockerby

To: comments@osc.gov.on.ca
Subject: BC Securities Commission re: mutual fund fees.

To Whom it may concern.
My name is Harold Lockerby, 68 years old, worked all my life, retired 2 years ago. I have purchased mutual funds, for my retirement, thru financial advisers for the for the past 35 years. Over that time period I have asked these advisers, over and over again, how much they are charging me in dollars and cents. All I got were vague answers that the fees were somewhere between 1.5 & 3 % of my portfolio value, whether they made me money or lost me money. They said it was very difficult to calculate a dollar figure. If I owed THEM money, it didn't seem difficult at all, I had the bill the next day. I, and everyone I know, have been extremely annoyed that regulating bodies have allowed this lack of accountability to go on for so many years.

Last year my financial adviser told me they had to disclose these fees, I believe mandated by the securities commission, by the end of 2016, and would show them on my statement, which they did. I recently had a meeting with my financial adviser and found out that the fees disclosed on my statement are only the fees charged by the financial adviser company and didn't include fees charged by the mutual fund company. The fund company fees are buried as a % in the MER, same as always and I still don't know, as a dollar figure, how much I am being charged. How has this been allowed to happen and when is it going to change? I am now beyond annoyed, progressing to extreme anger, the same as my friends. These companies have to be held accountable for the average citizen to make informed choices on who manages their money.

Yours Truly
Harold Lockerby

To Whom It May Concern:

As an advisor and PM for the past 20 years I have been fortunate enough to survive an industry where 90% of my Midland Walwyn peers in my graduating class are no longer in the industry. Thankfully, owing to a supportive wife and some persistence through lean years, I have been able to forge a successful career. Nevertheless, I am deeply concerned about the future of our industry.

I'm sure I don't need to inform you that the average advisor is 59 years old (so I've been told). I'm also fairly certain that precious few of these people got into this business due to a love of paperwork, although this is now the status quo. No doubt you are also aware that financial education in this country is practically non-existent and that front line bank employees are often lacking in experience and knowledge through no fault of their own. Despite all of this, you are contemplating major changes to an industry that just finished implementing 3 years' worth of major changes, which we have yet to be measured for effectiveness.

Embedded commissions are not a perfect solution but they are certainly better for some clients -- especially those with smaller amounts to invest. It is the 25 and 35 year olds that really need our help as advisors, not the 60-year-olds where shrewd planning and decent returns have less time to change lives. I liken the situation to medical advice, which to me is the only type of advice more important than financial. Here, our society chooses to bill everyone through taxes, knowing full well that people would often not pay the thousands of dollars needed for care when needed. Medical advice is deemed too important to not charge people for, irrespective of whether they use the services. As regulators, you know that financial help is almost as critical and for young people, likely more so. I have seen a few clients choose to leave our practice over the years because they don't like the push to direct fee-billing and they have moved to online investing. I still wonder how these people are doing sometimes, because I've seen through experience, that not many have the skill to properly manage all aspects of investment management and financial planning.

In fact, I think this is really the crux of the debate. If we know that limiting billing options may lead to some advisors choosing to retire, and less choice as the banks and others are unlikely to go on a hiring spree; then the question becomes where do we want people to get the advice from? The internet seems to be a great place to get a lot of information but also a lot of "alternative facts". Online accounts, ones I've seen, almost always lead to pathetic returns or too much or too little risk. A new alternative, robo-advice is in its infancy, and it remains to be seen if this will produce superior results to online, diy accounts. I suspect that it may for some, but not for all.

Whatever, you decide, and I'm sure your minds are largely made up, my business interest is not why I'm writing. At 45 I can adapt, and my clients are generally content, well-served, and frequently referring others to us. That said, I fear the future costs of your pending review, to those who may not be able to access quality advice, will be immense.

Over 20 years, I have seen so many lives ruined from prospectus-exempt investments where people lose 100% of their money. I've seen depression caused by this. On another occasion I've called in to report fraudulent misrepresentation, only to be told there was nothing that can be done. Clients of mine almost lost their life savings in this scam, and I know of several non-clients that did lose everything. Furthermore, I have seen lives ruined by needlessly complex and grossly overpriced insurance product. And I've seen the negative impact of poor or improper investment return disclosure over long periods. Some of these have been recently fixed, to your credit. Never have I seen lives ruined by an extra .3% charge on a mutual fund. If this is a major concern, there are much simpler ways to fix this issue without limiting investor choice.

The actions you are contemplating are important but to me will clearly have both positive and negative effects for investors. I would urge you to give the full weight of your contemplation to this The work I do effects the lives of a couple hundred families. Your work will affect millions for many years. Choose wisely.

Stan Penner | CFA, CFP, FCSI
Investment Advisor / Portfolio Manager

Good afternoon,

My name is Chris Dietz and I am a Certified Financial Planner based in Listowel Ontario for the last 27 years. I would like to pass on the following comments on your proposal to ban embedded commissions and DSC/LL.

I fully agree with the direction that you have taken in regards to CRM and full disclosure of fees which has just taken effect for 2017. Each client should be made well aware of what the dealer/advisor is getting paid to manage their account. Now clients will be able to open their statement and see exactly what they are paying for advice. I expect there will be many investors who will be surprised and will question the value they are receiving for those fees but in the end they will be better served.

Our business model here is a combination of fee based and embedded fee model and has been for the last 10 years. We fully disclose to clients exactly what we get paid in percentage and dollar amounts since making the switch from DSC/LL. The recent changes from CRM now fully discloses the fee paid to our dealer and is welcomed. My recommendation for CSA would be to keep embedded trailers as it provides another option of purchase for the Investor. The client is receiving full disclosure on the amount of fees they are paying now with CRM so why would you eliminate the embedded option? How does the embedded fee option differ now from the fee based option? The client is now seeing exactly what they pay in either account.

In regards to the banning of DSC and LL funds, this will not affect my business at all but I feel it may cause a barrier to entry for new advisors into our industry. I cannot see how a new advisor would be able to enter the industry and build a business from nothing like I did without this option of compensation. The only option a new advisor would have is to come in under a veteran advisor and gradually grow that way. As the average age of an advisor is rising, I am sure that as an industry we wouldn't want to limit entry.

In summary I feel strongly that you need to provide choices for the investor on how they compensate their advisor. Reporting of the actual dollar amount of fees to the client is a good first step, but, I would question why wouldn't CSA take some time to get feedback from Investors before eliminating embedded commissions. It might be prudent to wait a couple of years until you find out how the industry and investor is adjusting. I think CSA will find out pretty quick that small investors will not be served well by the decision of eliminating DSC/LL. Under the new fee model small investors will be charged more to deal with an investment professional to make their account size viable for the advisor's business plan. CRM has taken the steps to fully disclose advisor compensation which we applaud, but, take the time to fully analyze these changes before jumping to conclusions on what is best for investors.

Thank you for taking the time to read my letter and I hope it provides some insight into our client base and our thoughts on elimination of embedded commissions.

Thanks,
Chris

Re: CARP – Submission to the Canadian Securities Administrators (CSA Consultation Paper 81-408)

Please note that we have compiled additional data to supplement our position on the option of discontinuing embedded commissions, and as such, we would ask that you kindly replace CARP's February 17, 2017 Submission on Consultation Paper 81-408 with the attached.

CARP is a national, non-partisan, non-profit organization that advocates for financial security and improved health care for Canadians as we age. With over 300,000 members and nearly 50 chapters across Canada, CARP works closely with all levels of government and collaborates with other organizations to advocate on health and financial issues. CARP enlists its members' voices to increase its clout to most effectively advocate for its priorities.

Thank you for your kind consideration.

Sincerely,

W.W. Morris

Wanda Morris
VP of Advocacy

Marissa Semkiw
Director of Policy

70 Jefferson Ave. Toronto ON M6K 1Y4 www.carp.ca **Phone:** 1.888.363.2279 **Fax:** 416.363.8747

Summary
CARP is pleased to have the opportunity to provide input on CSA Consultation Paper 81-408 regarding the option of discontinuing embedded commissions. We believe in a well-regulated investment industry that allows Canadians to manage their investments more effectively and to plan for their retirement with added confidence. As such, CARP would like to see provincial regulators prioritize the initiatives necessary to make financial markets safer, less costly and more transparent for our members, and by extension, all Canadian investors.

CARP calls for the immediate elimination of embedded commissions (trailer commission) paid to advisors. We believe that there is no compelling argument for permitting embedded fees to continue.

Embedded Commissions

Question 1. Do you agree with the issues described in [Part 2, Section A]? Why or why not?

A recent study calculated the average equity mutual fund fee in Canada to be 2.1% - six times higher than the average pension plan fee.[1] While Canadian regulators recently implemented the second phase of changes to the Client Relationship Model, known as CRM2, reforms didn't go far enough. Financial firms must only disclose the cost of advice; there is no requirement to disclose the cost of products sold.

CARP unequivocally agrees with the findings found in Part 2, Section A of the consultation paper regarding the key investor protection and market efficiency issues raised by mutual fund fees and related evidence. The paper identified conflicts of interest that misalign the interests of investment advisors and investors as a key investor protection issue posed by embedded commissions.

Indeed, the trouble with trailers is threefold. A recent study by York University professor Douglas Cumming found that mutual funds that pay above average commissions attract and retain investment dollars regardless of their performance. That is, the capital invested in these funds does not leave even if it is performing poorly. Meanwhile, when a mutual fund paying a typical commission underperforms, investors take their money elsewhere. This is a significant problem, but it's not the only one.

---

[1] David Macdonald. (March, 2015). The Feeling's Not Mutual: The High Costs of Canada's Mutual Fund Based Retirement System. Canadian Centre for Policy Alternatives. Located online at [https://www.policyalternatives.ca/sites/default/files/uploads/publications/National%20Office/2015/02/Feelings_Not _Mutual.pdf]

Second, we are aware that some on-line brokerage services sell funds which include embedded commissions. As these firms are, by definition, selling a do-it-yourself product, charging an embedded commission for advice is tantamount to theft. CARP believes that there is absolutely no merit in allowing companies to collect money for a service that they do not provide. Furthermore, some strong performing mutual funds only sell fund classes which include an embedded commission so investors cannot purchase such funds without also paying a commission for a service they will not receive.

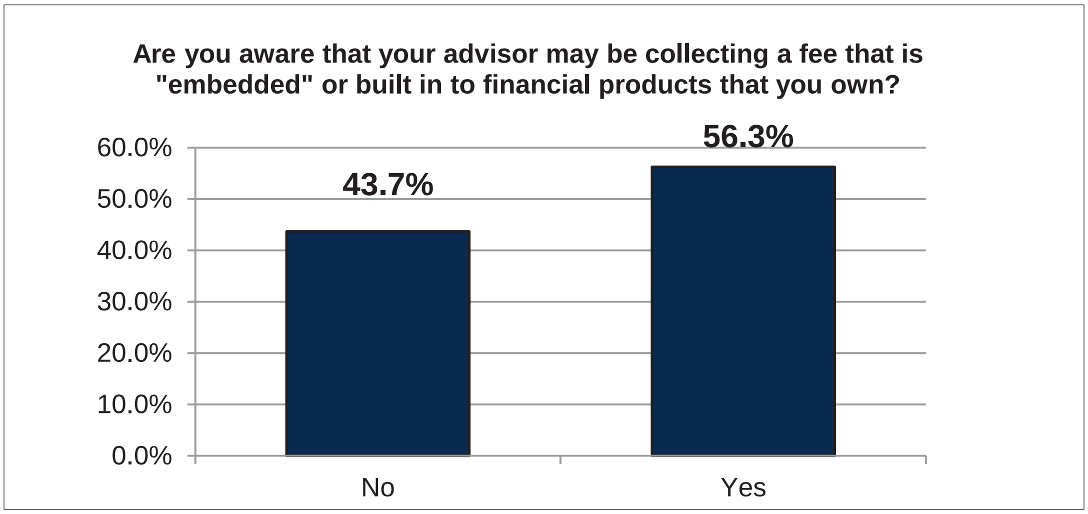
Lastly, we have heard anecdotally from members who were not aware they were paying embedded commissions. This is consistent with our survey results, which found that 44% of our members did not realize that they were paying embedded commissions to their advisors. Moreover, less than half knew when their advisor received a commission from selling a financial product or how much the commission was.

For these reasons, CARP endorses a move to direct pay arrangements and the elimination of embedded commissions, like trailer commissions. This will better align the interests of financial advisors and their clients and provide increased transparency with respect to fund costs. Not only will the elimination of embedded commissions reduce the inherent conflict of interest in the current mutual funds sales model but this will also allow investors to more easily understand and control an important cost component of their investments. CARP believes this heightened transparency and control will encourage fee reductions and improve overall returns to clients.

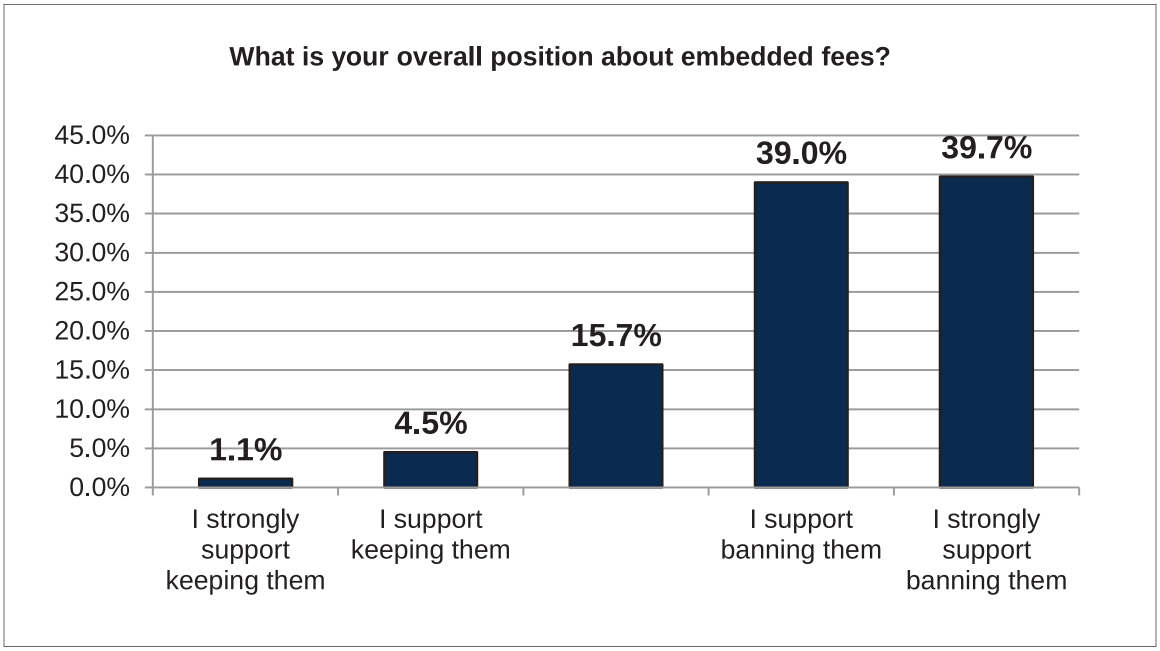
Poll Results

CARP builds its policy positions on the views of our members. @We asked members to rate their level of agreement (or disagreement) with arguments put forth by lobby groups like Advocis, The Financial Advisors Association of. The detailed questions are below. After considering all the arguments for and against embedded commissions, **79%** of CARP members polled supported a ban on embedded fees.

Question #1 Are you aware that your advisor may be collecting a fee that is "embedded" or built in to financial products that you own?

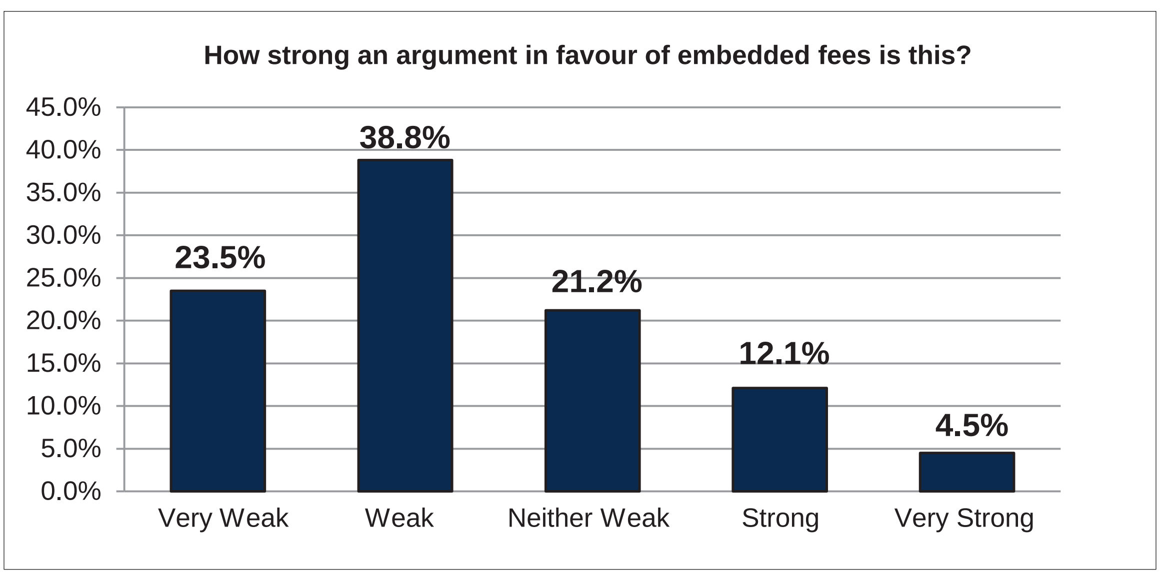


Question #2 What is your overall position about embedded fees?

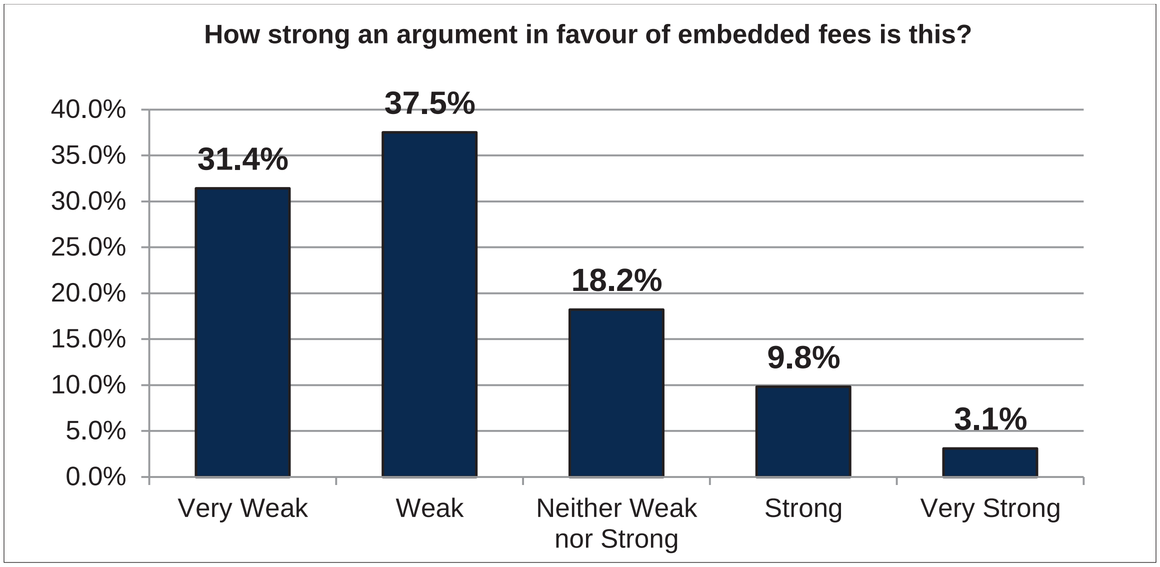


Arguments in Support of Embedded Commissions

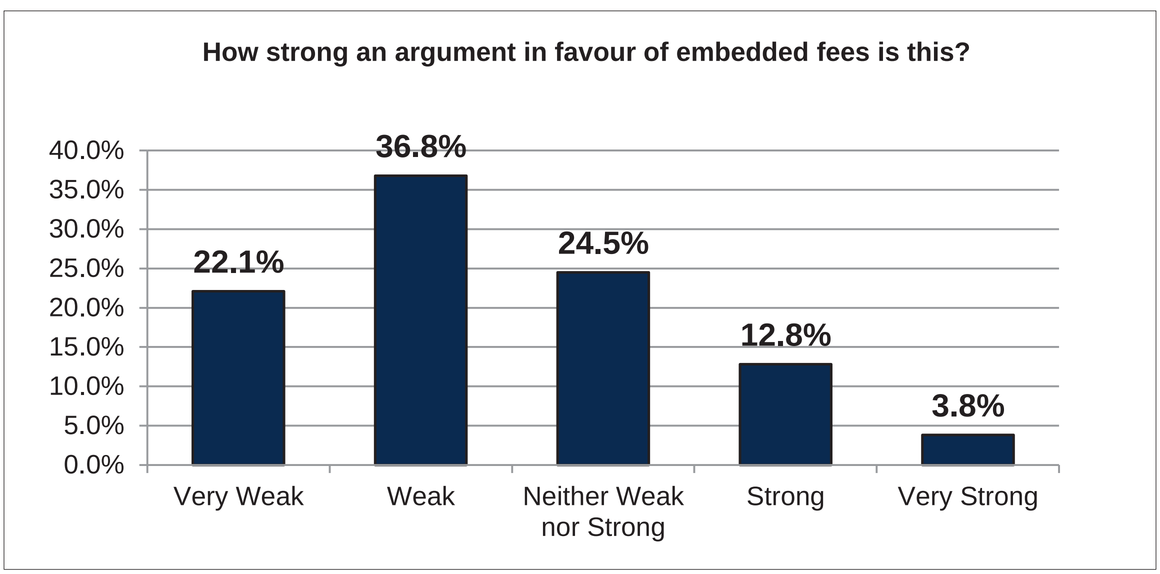
Argument #1 Individuals who have a financial advisor are better prepared for retirement than those who don't. If investors are aware of how much they are paying for advice, they'll stop doing so and will be less financially secure in retirement as a result.



Argument #2 When the UK banned embedded fees, the number of advisors in that country declined from 40,000 to 31,000. Lobby groups are concerned that fewer advisors will mean more people are left without financial advice.

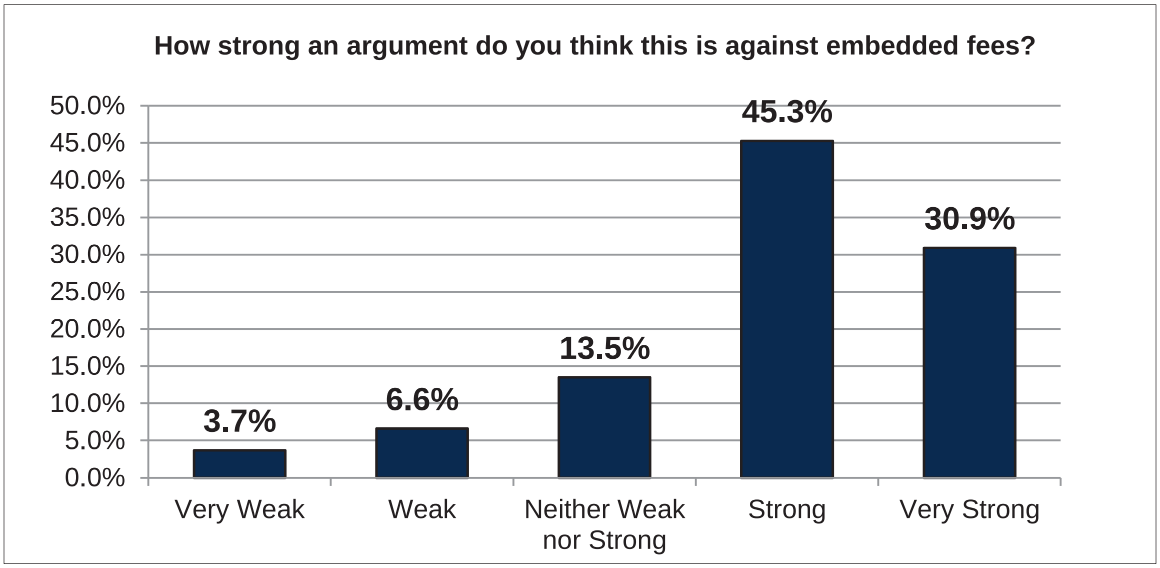


Argument #3 Without the financial incentive of future trailer commissions, advisors may be unwilling to take on clients with less money, so those with assets below, say, $100,000 will be left without access to financial advice.

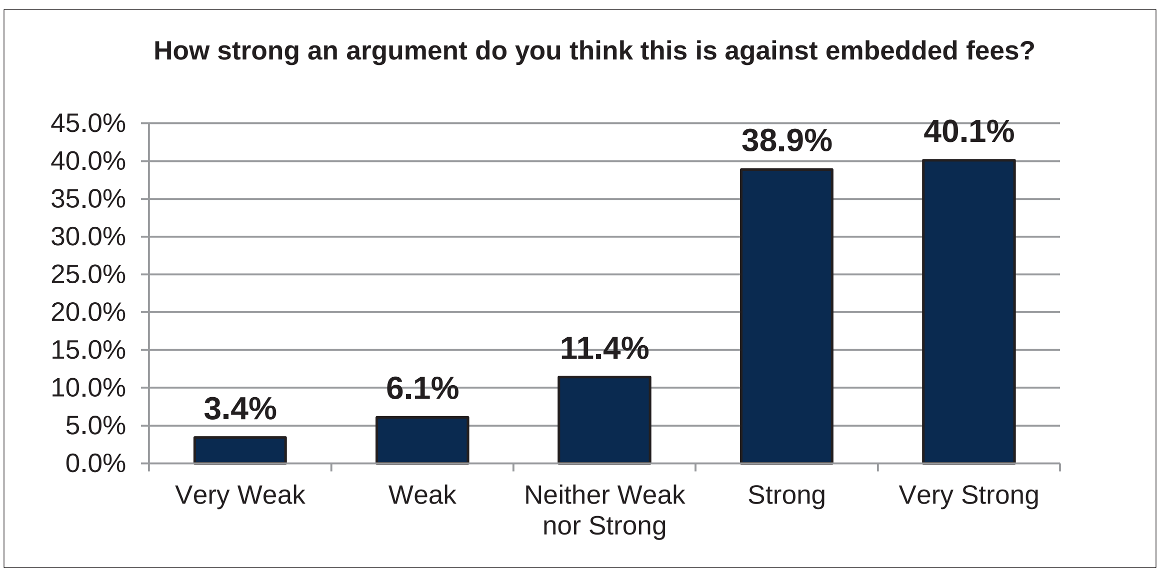


Arguments Against Embedded Commissions

Argument #1 Individuals are often unaware that they are paying these fees and as a result may be paying far more for their investments than they realize.



Argument #2 The payment of an embedded fee can encourage financial advisors to direct clients' assets to the funds that pay the highest commissions, not those that are the best performers.

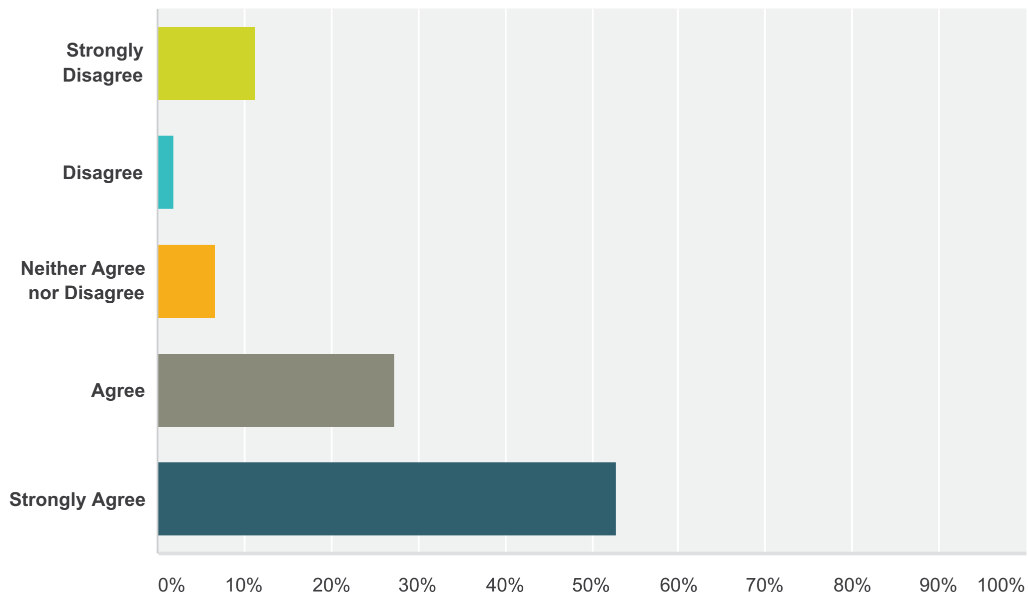


To view CARP's complete poll results, please see Appendix A.

APPENDIX A

Q1 Please indicate how much you agree with the following statement: I think that CARP should advocate for regulatory changes that will reduce the fees paid by Canadian investors.

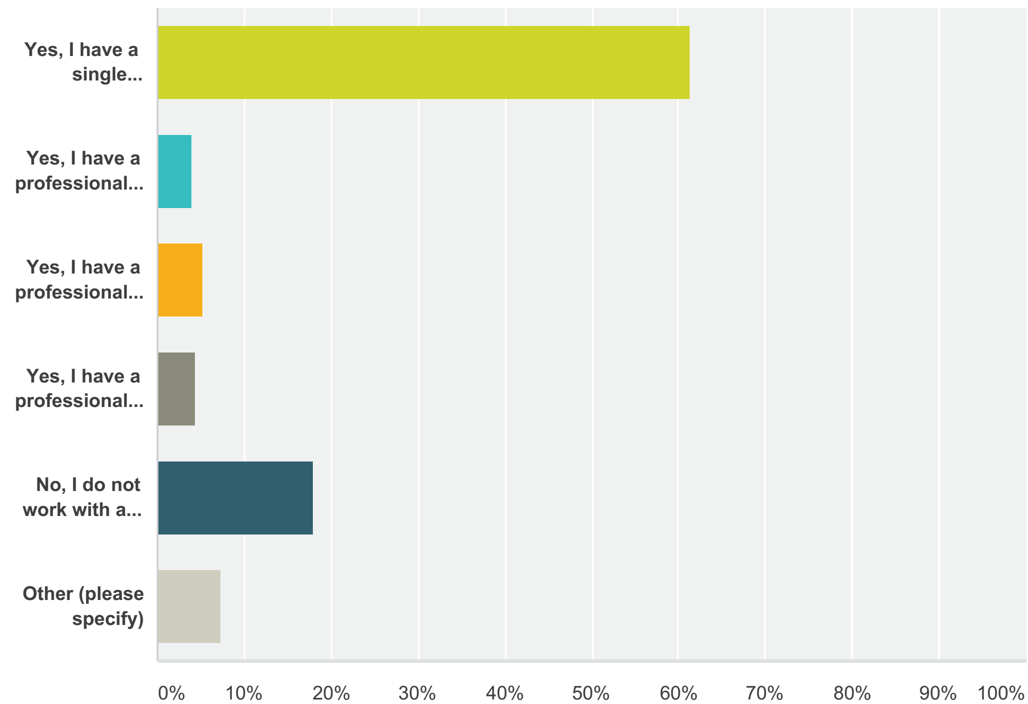
Answered: 2,588   Skipped: 23



Answer Choices	Responses	
Strongly Disagree	**11.24%**	291
Disagree	**1.78%**	46
Neither Agree nor Disagree	**6.76%**	175
Agree	**27.40%**	709
Strongly Agree	**52.82%**	1,367
Total		**2,588**

Q2 Before we get into questions about your opinions, we want to ask you some questions about your specific situation.Do you currently have a professional who provides you with financial advice and/or who buys financial products (e.g., mutual funds, ETFs, stocks, bonds, etc.) on your behalf?

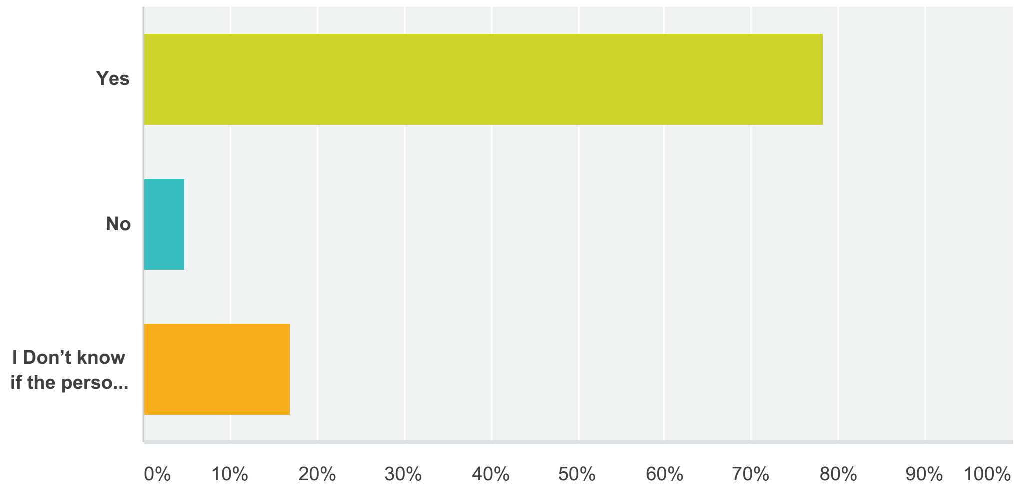
Answered: 2,539 Skipped: 72



Answer Choices	Responses	
Yes, I have a single professional who provides me with advice and also buys financial products on my behalf.	**61.32%**	1,557
Yes, I have a professional who provides me with financial advice, and a separate person who buys financial products on my behalf.	**3.98%**	101
Yes, I have a professional who provides me with financial advice (but I do not have a professional who buys financial products on my behalf).	**5.20%**	132
Yes, I have a professional who buys financial products on my behalf (but I do not have a professional who provides me with financial advice).	**4.33%**	110
No, I do not work with a professional who provides me with either financial advice or who buys financial products on my behalf.	**17.88%**	454
Other (please specify)	**7.29%**	185
Total		**2,539**

Q3 Is the person who provides you with financial advice a Certified Financial Planner (i.e. is someone who has received CFP designation)?

Answered: 1,751 Skipped: 860



Answer Choices	Responses	
Yes	78.30%	1,371
No	4.74%	83
I Don't know if the person has a CFP designation.	16.96%	297

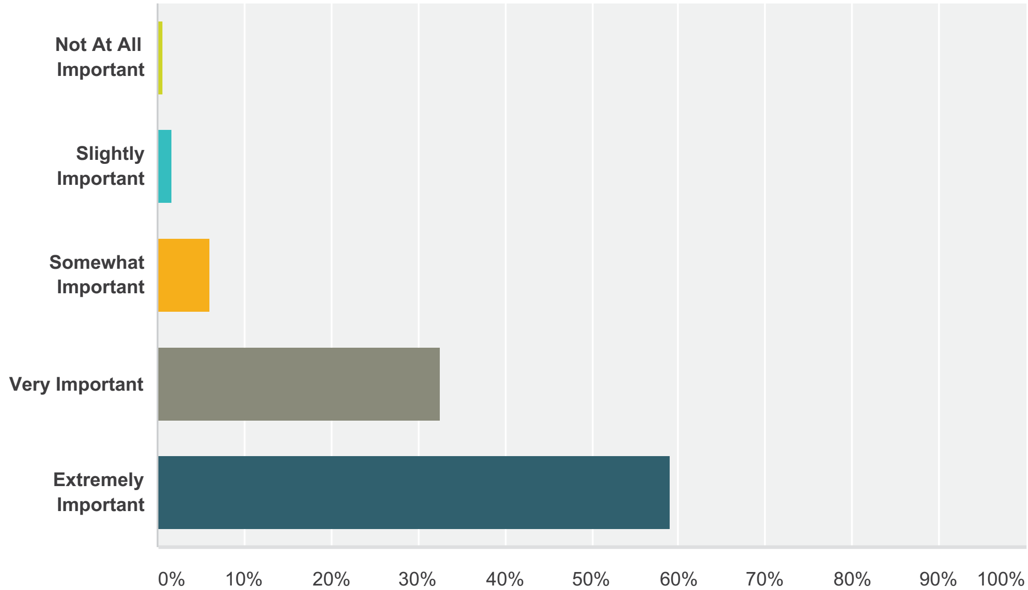
I believe my financial advisor is required to recommend products that are in my best interest, not ones that maximize their commission.	**4.09%** 71	**9.22%** 160	**22.70%** 394	**37.67%** 654	**26.32%** 457	1,736	3.73

Q5 Recent changes to regulations in Canada have increased the amount of information that must be disclosed about fees paid by mutual fund investors. Under these new regulations (called CRM 2, which stands for Client Relationship Model 2), some, but not all, fees must be displayed clearly to investors on their statements. Specifically, the fund management costs is not disclosed, but the cost of advice must be.The fund management costs are paid to the mutual fund company and covers the cost of hiring the investment professionals who decide which assets (i.e. stocks or bonds) to purchase on behalf of the fund, transaction charges, and overhead costs. Although these costs are not shown on investors' statements, they are provided to investors - as a percentage - with the marketing material provided for each fund. The cost of advice is the money paid to the company the financial advisor works for. Under CRM 2, the cost of advice must be included on client's statements, but investors are still unable to tell how much commission their advisor receives for selling them different products.Please answer each of the following questions by indicating how important you think it is for each piece of additional information to be provided to investors on their statements.How important do you think it is for ALL fees to be shown on investors' statements (i.e. the cost of providing advice AND management expenses)?

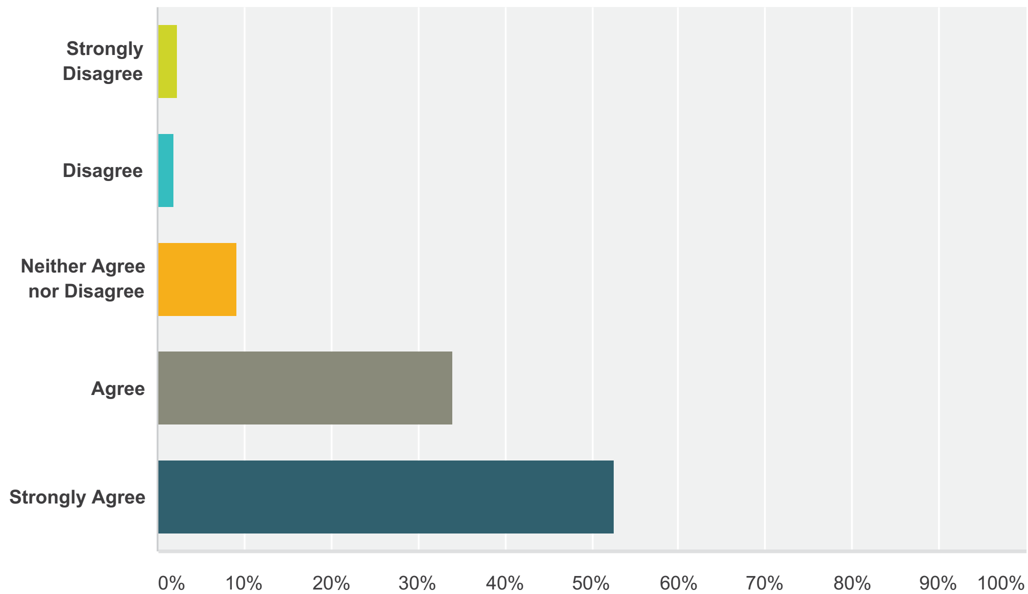
Answered: 2,435 Skipped: 176



Answer Choices	Responses	
Not At All Important	**0.57%**	14
Slightly Important	**1.64%**	40
Somewhat Important	**6.12%**	149
Very Important	**32.61%**	794
Extremely Important	**59.06%**	1,438
Total		**2,435**

Q6 How much do you agree or disagree with this statement: I think that providing investors with additional information about all the fees that they pay on each statement (i.e. fees for both advice and for fund management) will improve investors' ability to make sound financial decisions.

Answered: 2,437 Skipped: 174



Answer Choices	Responses

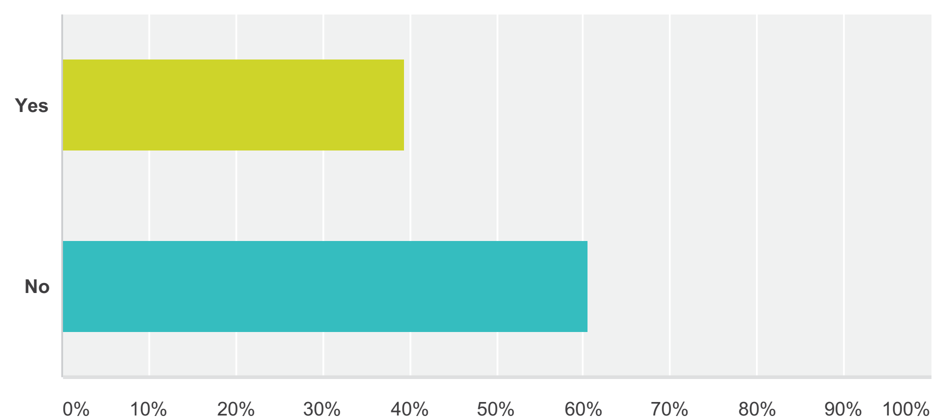
Total		**2,433**

Q8 In Canada, only certain designated professionals are required to resolve compensation-related conflicts of interest in favour of their clients. The majority of financial advisors are free to recommend financial products to their clients that provide higher sales commissions, rather than better financial returns. The cost of such conflicts of interest are substantial. For example, in the US, investment-related conflicts of interest are estimated to cost investors $17 billion per year.Were you previously aware that many investment advisors are not required to recommend products that prioritize your returns over their commissions?

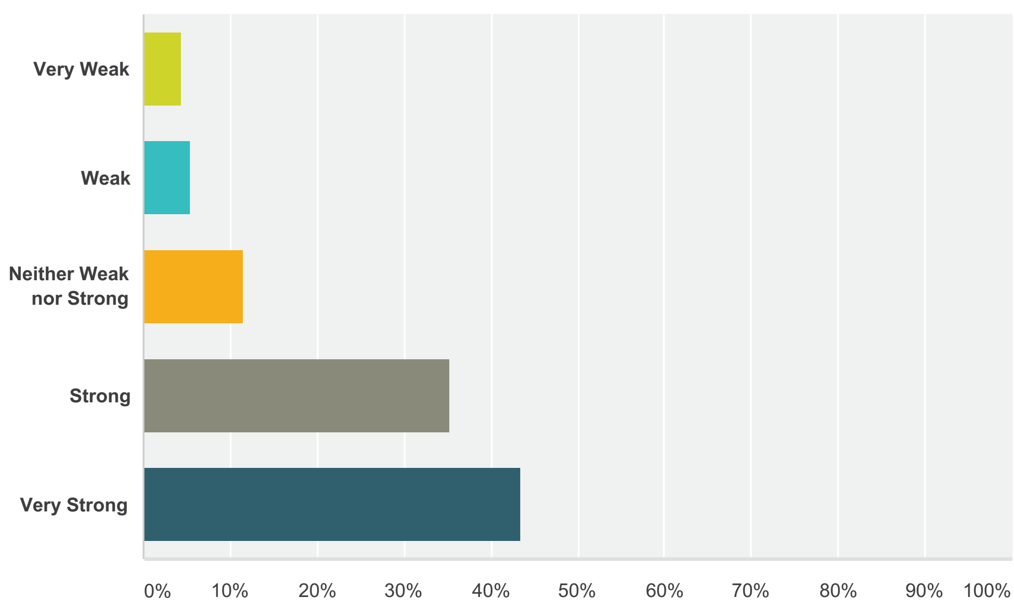
Answered: 2,208   Skipped: 403



Answer Choices	Responses	
Yes	39.40%	870
No	60.60%	1,338
Total		2,208

Q9 First Argument in Support of a Best Interest StandardUnder the current system, investment advisors frequently face conflicts of interest. This occurs when the financial product that is best suited for the client does not provide as large a commission for the financial advisor as some other, equally suitable alternative (for example a mutual fund vs. an index fund). Research clearly indicates that this conflict of interest causes investment advisors to sell products that are not in the clients' best interest, increasing the fees paid by clients, and reducing the clients' investment returns.How strong an argument do you think this is for a best interest standard?

Answered: 2,199 Skipped: 412



Answer Choices	Responses	
Very Weak	**4.41%**	97

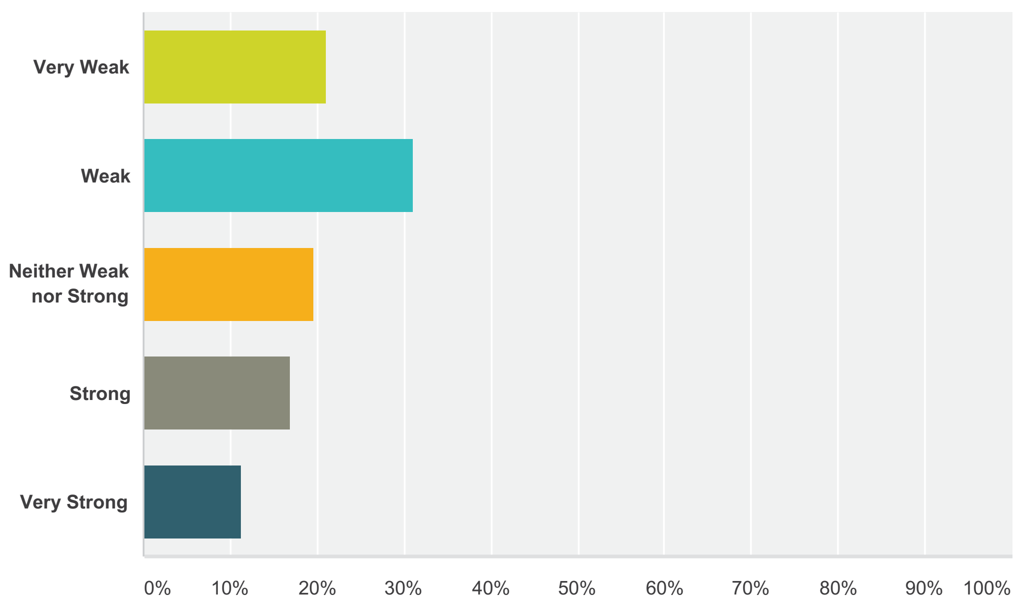
Q12 First Argument Against a Best Interest StandardSome investment advisors only sell a narrow range of proprietary financial products and therefore could not meet a best interest standard. If a best interest standard were put in place, these advisors would be unable to continue operating as they do now because they do not currently offer the low-cost options that are in the best interest of many investors. As a result, if a best-interest standard were implemented, these advisors would either need to make substantial and costly changes to their business models, or go out of business. How strong an argument do you think this is against a best interest standard?

Answered: 2,177 Skipped: 434



Answer Choices	Responses	
Very Weak	21.13%	460

Strong	16.90%	368
Very Strong	11.35%	247

Total	2,177

Q13 Second Argument Against a Best Interest StandardThe cost to investment advisory firms of meeting a best interest standard is higher than the cost of meeting the current standards. These additional costs would likely be passed on to investors in the form of higher fees. Although the overall fees paid by average investors would be reduced by implementing a best interest standard (because investors would no longer be influenced to purchase financial products that have high fees and are not in their best interest), there is a chance that a small percentage of investors would end up paying slightly higher fees.How strong an argument do you think this is against a best interest standard?

I am an expert.	1.73%	34
Total		**1,967**

Hi Jason,

I have a few brief thoughts on embedded commissions and would like to share them with the CSA.

First, I would comment that as an wealth advisor, I am seemingly in a small minority in agreeing with the CSA that for the most part, embedded commissions should be banned.

Perhaps the most flagrantly offensive embedded commission structure is the Deferred Sales Charge (DSC). I would contend that DSC's serve as handcuffs to lock-in investors to a particular fundco for 5-7 years. Fund companies overcompensate advisors to place clients in DSC structure, by paying them 5-7 years in advance (unearned) commissions. Fundco's would argue that they are fronting the investor's fees, so it is only fair that they can protect their interests by retaining the investor's funds for the 5-7 year period, allowing the fundco to recover its advance. However when an investor leaves the fundco, the early redemption fee charged to the investor simply repays the fundco for monies it has paid to the representative as an upfront, unearned commission. Where is the fairness in that? Why isn't the representative forced to reimburse the fundco (or the investor) for unearned commissions? In effect, under the current DSC structure, the representative is paid in advance for work that has yet to be performed. If the client elects to move to a different fund company within the 5-7 years, the client – and not the advisor – is required to pay DSC fees (early redemption charges), which can amount to a considerable cost. Grossly unfair…

Furthermore, DSC structure also invites blatant skirting of the rules, as a small percentage of advisors actually move DSC expiring funds into a new DSC schedule with a different firm, effectively churning the client's money into another locked-in period. Of course, DSC structure also fetches the highest fund management fees (MER's). It's a double-whammy for the client. I appreciate that this is a flagrant violation of the rules, however I contend that this practice is quite prevalent. Possibly with CRM II and newly required disclosures, this practice may slowly ebb.

Notwithstanding my condemnation of DSC's above, I would point out that I believe embedded commissions as such may have a useful purpose to serve – in very a restricted context. Read on…

In the CSA report, it acknowledges that many stakeholders contend that the small investor may be left to fend for themselves if embedded commissions were banned. The CSA suggests that these folks would be able to acquire services somewhere in some fashion. I'm not certain the CSA is completely correct on this point. To my mind, the issue is a very legitimate concern. Most advisors that I know would have little to no interest in working with a client who had less than $150,000 to invest.

As most stakeholders will acknowledge, new advisors typically experience considerable difficulty in generating an income stream. Being new, they have a great deal to learn before larger clients might have an interest in working with them. This puts them in a difficult position… how to bring in clients and learn the ropes, while paying the heat and rent.

So my thought is that possibly new advisors could be given a specific Rep code that would remain in effect for 5 years (the 5-year code), afterwhich it would automatically convert into a new "permanent" code. Under the 5-year code, advisors would be permitted to invest client money into funds with embedded commissions, including the DSC structure. An appropriate, but simply-phrased and easy-to-understand disclosure form would be required to be signed by all clients being placed into fund with embedded commissions. After 5 years, no new embedded commission funds would be allowed, by virtue of the advisor's new code. Codes would be programmed to allow embedded commissions (under the 5-

year code), or prohibit embedded commissions (under the "permanent" code). Obviously, existing DSC's would be allowed to run their course.

The multi-purpose effect of this recommendation is to hopefully:

- Create an advisory "field" that is ready, willing and able to service small clients (clients who would not meet the minimum investment threshold of intermediate and senior advisors)
- Provide small investors with a cohort of advisors from which to choose to service their requirements. This cohort might also be subject to minimum educational requirements to help them get their footing in the industry and foster professionalism. (This aspect could be an add-on for a future time)
- Promote new entrants into the industry by allowing them to earn an income while building their business
- Minimize unintended consequences

This proposed structure, or something akin to it, could be time-limited to measure its benefits and drawbacks – and as well could serve to ease the move away from embedded commissions.

Thank you for your time in considering this writing.

Kind rgds,

Joel Attis

To Whom it May Concern,

I am not an active advisor but I am a Branch manager of some. I also spent a considerable portion of my life wholesaling for a major Mutual fund company. In my wholesaling role I met advisors in Southwest Ontario, the Maritimes, Saskatchewan, Alberta and British Columbia. Although there were many reps I met I wouldn't let wash my car (this is a licencing and competency issue) I believe the vast majority were in this business to truly help their clients develop and meet their individual financial goals. By providing choice of compensation I believe we are serving the public interest. This allows advisers and their clients to determine which method works for them. The first Mutual Fund I purchased was a 9% Front end. The 9 % difference, compounded, makes a dramatic difference in the ultimate return of the investment. The market took care of this issue. By allowing clients to pay a small fee or no fee upfront we provide them a better chance at meeting their investment goals.

This industry currently has a demographic issue. Many advisors are Baby Boomers and they and their clients are getting older. If we do not allow new independent advisors to be fairly compensated for the effort that goes into finding and servicing clients we will have no new young people coming into the industry. Young entrants will be compelled to follow a career in which salary makes up their compensation such as the banks or be forced to work in career or captive shops.

Consider this: Scotiamcleod fired most of their IA's with over 10 years' experience who grossed under $ 600k in commission. In what any other business does earning $ 600k a year make someone an "underperformer" ? It seems to me basing someone's worth in this business in any other way than ethics, expertise and client satisfaction is the real problem.

If the CSA truly wants to ensure clients are treated fairly I would suggest they CAP the compensation manufacturers can offer advisors. For example, I learned today Empire Life offers a 1.25% trailer fee on FE business. The CSA should cap ALL FE trailers at 1%, DSC at 5% and limit FE to 3 % (all the advisors I am associated charge 0-1% FE). By limiting the compensation OFFERED the CSA can protect investors while ensuring this industry, which I believe gets a very bad rap, is allowed to offer Canadian Investors, big and small, the opportunity to obtain non-biased independent advice.

I clearly have a vested interest in this debate. I will also freely admit no one has been able to explain, let alone convince me we are going the way of Britain and Australia. I also believe this industry needed to get cleaned up and am happy about CRM II and look forward to its effects.

As someone who has spent the majority of his working life in the securities industry and as someone who now looks after Tier 1 compliance at my branch, I am proud of the great work our independent, commission based advisors do for their clients. To drive them out of the industry thus leaving those who actually need help at the mercy of the banks, the Investors and the London Life's of the world is, in my opinion, contrary to the goals the CSA, the MFDA etc.. are trying to accomplish. I think building on the findings and spirit of the Stromberg Commission makes a lot more sense.

Regards,

David Rupert

To the CSA,

I am a financial representative with Desjardins Insurance and wish to speak regarding your assessment of embedded fees and trailers. I understand you are trying to do what you feel is best for the general public but I feel there will be serious negative effects for the average person.

My business is made up of mainly smaller clients who have less than $100,000 in investments. I spend a great deal of time with these people and do thngs like creating quarterly budgets, tax planning, needs assessments, estate planning and much, much more. I am very worried about how things will negatively impact my small clients with this change as I will be forced to either charge an hourly rate or fees will come straight out of their investments which will hamper their progress. As well, most advisors will not be able to afford to take on small clients under 100k.

I've read many opinions that small clients can either go to the bank or use robo advisors which in my opinion makes them second class citizens when it comes to access to financial advise and help. The vast majority of my clients didn't know how a fund works, what dollar cost averaging is, the rule of 72 or what an MER even was before I sat with them and explained it all. Despite having investments for years with the bank!!

I also fear that this will change the nature of my relationship with my clients. My clients know they can call me for any reason and often do and this is one of the reasons I love my career. This is NOT just a business, I am invested in these people on an intimate level. My clients call to get my opinion about whether they should lease or buy a car, that they got a promotion or raise at work, that they just had a baby or share other good news. I am part of the family. They also call when they don't understand something like their pension plan at work and I do many hours of research to get them answers. I have read the pension act of BC! I have read the power of attorney act of BC! Why? Because my clients needed answers. If my clients had to pay an hourly rate for that they just wouldn't do it and they certainly wouldn't know how to do it on their own. I don't get paid to do these things for my clients so trailers is my compensation for this extra and ongoing service.

I realize there are many faults within this industry, we need to focus more on the qualifications of the individual representatives and to ensure clients are protected from unscrupulous people. I have clients who have lost tens of thousands of dollars to Ponzi schemes, phishing scams and online dating scams before they met me.

In closing, my clients currently have the option of paying an up front sales fee, a low load or a 6 year DSC. They consistently choose the low load option as they don't want costs coming directly out of their pocket. I explain how I get paid through the MER and trailer fees. My clients have no problem with me being paid a trailer for ongoing service and they have made it clear they don't want the current set up changed.

Please reconsider where you are headed with your policies as I have gotten a resounding NO to these changes from my client base.

Barbara Nash

Dear secretary

My practice as a financial planner provides consumers with direction that no robo advisor could do. The biggest assumption you make based on your consultation paper is that the consumer is not happy with embedded commissions. You are very wrong as those commissions are communicated and I have never had a complaint based on the service we provide. You readily admit that there will be a large segment of investors that will no longer have availability to an advise channel if you eliminate embedded commissions.. You assume that that is alright. The reality is that people need more help and advice then ever and how you missed that is beyond my understanding because it's very obvious everywhere you look. The other very important part to your out of line assumptions is that all advisor do is transact investments. You are in the process of causing substantial damage to Canadians and a whole industry of advise channels. Which I might add provided thousands of jobs to people who pay taxes and support their families. What gives you the right to do this much damage because it's certainly not in the best interest of consumers.

Give the consumer some credit to having some intelligent, big brother as you are attempting to be, has no position do what you are doing.
Stop this movement now.

RE: Embedded Commissions (CSA consulting paper 81-408)

To whom it may concern:

I am an IIROC licensed Certified Financial Planner who has been in this industry for 20 years. I am writing in response to the proposed banning of embedded commissions in the financial services industry. I firmly agree that this ban should take place, this is a change that is long overdue in Canada and the sooner it occurs the better.

Currently a large number of my clients are already on a fee based platform where their fees are debited from their individual accounts on a monthly basis. Presenting the fee to the client and charging them directly is a more transparent and fair approach. This type of direct fee approach mimics the experience and treatment a client would receive through any other professional service such as a lawyer, doctor, accountant, ect.

The only concern I would like to express when considering this ban is how it would affect the Canadian banks. I strongly believe it is prudent that the banks be given the same treatment and not be exempt from this ban in any way. If the banks were to be exempt it could be detrimental to independent advisors, and as a result to clients as well. It is no secret that banks build their business model with sales revenue as their top priority, and the front line staff often lack the knowledge to properly address the needs of investors. An exemption for the banks would cause investors to gravitate towards banks as an investment option. Many investors would be under the misinformed belief that when they invest at their bank it is free or at least cheaper. Ultimately, this will mean that investors are receiving, in most cases, low quality advice while still paying embedded commissions.

Furthermore, It is my belief that those who are against the ban on embedded commissions are simply trying to avoid changing the way they currently run their business, and would prefer to protect the 'status quo'. The reality is that embedded fees often misalign with the best interests of the investor. I have heard the argument that banning embedded fees will cause investors with smaller portfolios to lose access to affordable advice and I strongly disagree with this rationale. There are many alternative options available to less sophisticated investors and it is also reasonable to believe that if this ban is put into place further options will be developed.

Having a fair and ethical industry should be placed as a higher priority than making business operations easy for advisors.

Sincerely,

Waterloo Advisor

Hello,

I have worked as a financial planner in Listowel, Ontario for the past 22 years, partnering with independent mutual fund dealers to provide financial and retirement planning advice to a wide range of clients.

I applaud the direction of the CRM disclosure rules to ensure that clients are aware of the costs of the financial advice they receive. Individual investors should always be made aware of the cost of the advice they receive. While our preference would have been to provide full disclosure of all costs to investors (full cost of both MER and TER), this dealer compensation disclosure is a step in the right direction. We have been providing this disclosure (both in percentage and dollar terms) to our clients for many years.

We operate almost exclusively on a fee based model but with a combination of embedded trailer on no-load funds and transparent fee with “F” class funds. We have always felt that it is important to provide excellent advice to all of our clients, including those with less financial assets. Many of our clients don’t initially have an investment portfolio of sufficient size for a transparent fee model. Burdening them with either a minimum account fee or an hourly fee wouldn’t be in their best interest. The choice of an embedded trailer fee with appropriate disclosure allows us to form a long term partnership to help them achieve their financial goals. Removing this choice of compensation models could potentially severely limit the investment options for these small accounts and could either force smaller investors into a choice between trying to invest without any advice or have higher costs. The concept of capping the maximum embedded compensation (1% for equity/balanced, 0.5% for fixed income) eliminates any perceived conflict of interest for choosing different solutions and is an easily implemented solution and reduces the possibility of unintended consequences.

In conclusion, since the regulators have already made the step of requiring disclosure of fees paid to investment dealers, would it not make sense to wait until they can measure the effect of that disclosure before deciding their next course of action? Making a decision without that information makes the whole CRM II disclosure a waste of time and resources for investment management firms and investment dealers.

I appreciate the opportunity to comment and hope it provides some insight into the concerns of ourselves and our clients.

Thanks,
Trent Stanley CFP PFP CFSB

19th Floor, Box 55
Toronto, Ontario M5H 3S8

Dear Sirs,

I appreciate the opportunity to address the Canadian Securities Administrator's (CSA) recently released consultation paper on the potential elimination of embedded commission. While I understand the stated potential for conflicts of interest, there is something that is not being discussed in the paper, or in the comments on the report that I have read from the various interest group and regulatory bodies that have addressed this issue so far.

Before I get into that, let me state for the record that I strongly agree with complete transparency. Not only on TOTAL fees paid by investors, but also inherent conflicts of interest and advisor qualifications. Having been an advisor for the past 37 years, I have seen a lot of regulatory change, (especially in the last few years) and most of it for the betterment of investor protection, but none of it makes investors better investors. And there in-lies the disconnect.

I have no dog in this fight. My business is predominantly fee based, with the total fees fully transparent, and it has been that way for a number of years. So, the banning of embedded commission is not something that would affect me personally. However, I have been around long enough to know that it will have a significant impact, not only on the financial advice industry, but also for the individual investor in a less than positive way. I'm sure you have all heard that this type of a ban would produce an "advice gap" as experienced in the U.K., therefore I defer that very valid argument to others. But I think an even more significant impact and far more devastating to investors, and the Canadian economy, will be the "apathy gap" that will be created. Banning any form of advice compensation option for consumers, will not help in any way increase the number of investors that will seek out the advice they desperately need. You can't regulate consumer apathy for action, inaction, or a disciplined approach to personal financial management. This has been proven time, and time again, in the massive under use of RRSP's and TFSA's by average Canadians.

204 - 221 - 10th Ave., SE • Calgary, Alberta T2G 0V9 • T: (403) 231-8619 • 1-888-711-4346 • F: (403) 231-8646 • www.heinfinancial.com

There is a reason investors save 45% more when they have an advisor (as stated in a report from the University of Calgary's School of Public Policy). It's because they have an advisor calling on them to put money into things; to save for their future; to save for their kids' education; to save for their retirement. Is this in the advisor's best interest?...Yes of course it is...more money under management means more compensation. Is it in the investor's best interest?....Yes, of course it is...because the average Canadian simply does not go out and do financial things that are in their best interest. There is a huge "apathy gap" with the average Canadian in all things financial.

Look at the statistics; Canadians are spending and borrowing more and saving less. The latest RBC poll shows nearly half of all Canadians over 55 say they are not saving enough for retirement. And in fact, people are withdrawing money from their RRSP's before retirement at an alarming rate. People need more options to obtain financial advice....certainly not less. This is what is missing in this debate. In the end, what are we as an industry (CSA included here) hoping to do? I would trust that we are trying to make the Canadian public better, more informed, investors. As such we should be looking at more options to engage advisors, not less.

The consultation paper outlines six benefits to eliminating embedded compensation. Three of those six are basically the same thing, lowering costs. Two of the benefits are related to reducing the number of funds (series types and managers) and one is product distribution and "advice improvement", with the assumption that more advisors would become discretionary managers.

Let's talk about this latter "benefit" first. Discretionary managers don't create anymore "savings discipline" or "simplify an investor's life", any more than a good advisor that receives embedded compensation does. And, I would argue that, turning more advisors into discretionary money managers is a mistake. This would create an environment ripe for client abuse and fraud. Clients need planning services and education, they do not need more "stock, ETF and fund" pickers. After almost 4 decades in this business I can easily name a half dozen ways to really rip off a client and none of them are related to embedded commission. But every way to do it is made that much easier if you are a discretionary manger. The CSA would be acting truly in the consumer's best interest if it focused on those aspects and strongly enforced existing rules before proposing a ban on something that will have questionable results.

Now let's talk about lower fees. (Which, as I mentioned above, are three of the six "benefits" of an embedded ban as outlined in the report.) I think we are seeing the movement to lower fees begin already. Advisors and dealers are moving fees downward in the wake of CRM2 disclosure and the pressure is now on the manufacturers to do the same. However, CRM2 does not go far enough. The full and complete disclosure of all fees and taxes needs to be mandated and the CSA has a responsibility and major role in getting that done. CRM2 is a start, but it creates more investor confusion and little more than a "shell game" between some captive advisors and their product manufacturers. This one rule, the complete, full disclosure of all fees and taxes on investment funds will be good for the investor and will undoubtedly drive down total investor fees. It will allow the consumer to have all the relevant fee data to truly "shop around".

It seems very obvious in the report that the CSA favors ETF and index fund investing for Canadian consumers over anything else, simply because of the "perceived" lower fees. I say "perceived" because I've read for a number of years now how these types of investments are so much cheaper compared to a mutual fund. Yet many times the cost of advice, or trading fees, or extra tax preparation cost and so forth are never mentioned. Why is that? It truly reminds me of the airline industry advertising cheep fares only to discover when you go to book the flight, that when you add all the other fees and taxes on top, that it's not any cheaper than another advertised fare that includes everything you want. Yes, I'm sure that some investors would benefit from a cheap "do-it-yourself" approach. That option already exists. I'm also sure it's far less expensive for my clients to change the oil in their cars also, rather than take it to a car dealership to do it. But they don't. Therefore, while I also have my thoughts on whether an investing world made up of only ETF's or index funds would lead to market chaos, or at the very least rampant market inefficiencies, those comments are beyond the scope of this discussion and are saved for future debate. Currently, what does concern me is the CSA's obvious endorsement of one type of investment for seeming all clients over another. That, I would suspect, ironically flies in the face of the fundamental mantra of "Knowing your Client". Does the CSA believes the perceived cheapest is always best? I have my doubts.

I would also like to touch on the aspect of Robo-advisors and fin-tech firms filling in the "advice gaps" and providing increased competition to again...bring down investor costs. I think this is inevitable given the advancement in technology. I also think it is a good idea. Smaller clients can use these services to design portfolios for themselves and save costs. However, this is nothing really that new. In fact, the insurance industry has been doing this for decades in the employee pension area. The advantage the pension industry has is that, 1) the employees are for the most part forced to make a choice and, 2) employees are forced (mandated in most cases) to save the money. Yet, even with these two massive advantages to combat the "apathy gap" there are still many concerns regarding robo-advice that can be learned from the pension industry. First being that, people are still reluctant do anything if it's not top of mind and forced upon them (they will sit in cash accounts forever sometimes). Secondly, if they do choose a portfolio, they rarely ever change their portfolios when their life situations change. And third, (and this only comes with years of advisor experience), investors assume they are larger risk takers than they actually are. A simple risk profile that is done without complete knowledge of the client is a formula for disaster. The next big market down turn (and I've seen a lot of them) will shake the robo-advice industry to it's very core.

I see reports now that at least one robo-advisor firm wants to have no human contact at all to onboard clients. This will be another interesting decision that the regulators will have to make. Robo advice is here and it will grow, but it's yet to be determined if this will make for better investors. Sometimes the best advice an advisor can give a client is not to invest in the latest investment that looks "to good to be true". The adviser, regardless of their compensation is many times the only thing standing in between an investor and a life altering really bad investment decision.

The other one benefit the CSA paper outlines is that the aspect that the banning of embedded commission will reduce the number of fund series. Halleluiah! Here is something I can really get on board with. I think the CSA can solve a number of different issues at one time here with a very simple step. A complete ban on all DSC and Low-Load funds. Period. Get rid of them all.

On the numerous industry boards I have sat on over the years, I have been told that the number one consumer complaint, which number twice as many as all other investor complaints combined has to do with DSC fees. There is a simple solution...get rid of them. In addition to reducing complaints, by banning the use of DSC funds will also purge the industry of many of the conflicts of interest, and bad actors we all desire to get rid of. Plus, the abolishing of both DSC and Low-load funds will bring about an automatic substantial reduction in the number of fund series.

In summary, I do not believe that embedded compensation is THE issue. Far from it in fact. Investor apathy and financial education are far bigger issues. Consumers need to be left with that option of embedded compensation to engage with an advisor and have that advisor combat that "apathy gap." However, at the same time, advisors, and the industry, need to be totally transparent on fees. Embedded compensation does not, and should not, mean hidden fees. All the fees and taxes need to be transparent not just the current CRM2 mandated dealer fees. And finally, I recommend the banning of DSC and low-load fund options for the reasons I have stated above. Those three items and the implementation of the existing rules will have a much greater impact in assisting investors be better investors.

Don't carpet bomb and risk a lot of collateral damage when a surgical strike will yield you far better results.

Yours truly,

Brian Hein *CLU, CHFC, CFP, RFP*

Dear Madam:

I wish to share a short comment on CSA Consultation Paper 81-408 - Consultation on the Option of Discontinuing Embedded Commissions.

Please take note that these are my personal views and should not be attributed to my employer, National Bank of Canada, nor to IIROC, where I serve as a board member.

My views are based on 35 years in the investment industry as an Investment Advisor, a Branch Manager, Head of full service brokerage services, Head of Wealth Management at National Bank (including direct brokerage, mutual funds, NB Corresponding Network, NB Trust, Private Wealth). Furthermore, over the years, I've led the Investment Banking and Institutional Sales and Trading divisions. I have seen a lot and wish to share my opinion on the topic.

1. The trailers should be capped, thus eliminating temptation by a few to propose one product more than another.

2. I would let them be paid to advisors IF, AND ONLY IF, the IAs commit to meet with their clients at least once a year, and this should be tracked, that the KYC form be updated, the portfolio be reviewed and a plan made up with retirement as the goal.

Transparency should rule. Clients want financial, wealth and estate planning advice, but they do not want to pay directly for it. Unfortunately, they do not understand planning advice is more important than investment advice.

They expect to get free wealth advice through what they pay directly or indirectly to IAs.

The bigger picture issue here is: MOST CLIENTS REALLY NEED ADVICE.

By capping, but paying the trailers against forcing the IAs to revise the clients' position once a year, potential source of conflict would be eliminated and more positively IAs would provide advice on investments and, more importantly, on wealth in general.

If we do not take this opportunity to force the issue and simply cut the trailers, we will create orphan investors, with no advice at all, because they will just not pay for it.

IAs who are not willing to commit, don't get trailers.

Thank you,

Luc Paiement

Overview:

There is an old saying that goes something like "walk a mile in my shoes before..."

Few truly successful Advisers leave our industry. All others have not walked in their shoes and the bulk of the negative conversation directed at embedded compensation models comes from those who do not know our industry.

Including the relatively few (by percentage) consumers that have had negative experiences in the financial world. There should be none, but that is perfection and not realistic.

For example, once again, the most recent outing of Bank practices by CBC News. Imagine, over 1,000 staff, lower management and securities sales people admitting to corrupt and reprehensible behaviour...in one week!

Tens of thousands of innocent Canadians affected. Yet the focus is to destroy an efficient and age-old compensation system and drive even more of the most vulnerable Canadians directly into the Bank compensation model.

If successful the CSA will be applauded by Bank executives and shareholders alike who have been trying for decades (1992) to capture the independent adviser "market share".

Facts of Vested and Non Vested (and embedded) Commissions and/or Trailer Fees:

1/ The CSA has surely done its homework so it knows that 75% of all new financial advisers fail in the business the first 4 years. Even fewer remain at the 10-year mark.

2/ Almost without exception the ones who remain are among the highest quality, ethical and moral individuals in the country. It's embarrassing to see them attacked without any significant public backing (optics) from stakeholders around the country including the CSA.

- Obviously, ethical and experienced advisers have an acceptable compensation model. One accepted by millions of happy Canadian investors over numerous decades. The health and robust positive results of successful advisers and their clients prove the point.

3/ Accountants, Doctor's and Lawyers currently have a fee for service model and yet are regularly in the news for unsavoury practices. Case in point, billionaire clients of KPMG enjoying a tax pass by the CRA on back taxes (CBC News) for tax-free offshore investments. We all know the result if it was regular Canadians involved.

The CSA's proposed core compensation model (fee for service) looks shady in this light and does not solve what the CSA has positioned as a problem with the embedded compensation model.

4/ It is "known" that accountants, lawyers and financial advisers are "underpaid" in the first half of their careers and "overpaid" in their second half. In the first half successful advisers have worked up to 60 -90 hours weekly for 10 -20 years while being underpaid and a sacrificed family life. Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

5/ In lieu of pension plans including DBP, and DCP and Group RRSP plans not being available to advisers. Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

6/ In lieu of "Employment Insurance" (not available to advisers) along with Health, Dental and Long Term Disability and even sick leave Benefits are 100% out of advisers pockets. Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

7/ In lieu of a retirement age. When advisers stop working the value of vested revenues shrinks due to market forces. Many advisers work into their 80's or later as a result. Would public appointee's, management and staff at CSA offices like to trade? Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

8/ Canada Pension Plan premiums are double the cost to advisers as they pay both their portion and what is called the matching Employer portion of CPP premiums. Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

9/ Statutory Holidays, overtime pay and minimum wage are all benefits that have not been available to advisers. Unlike business owners they do not build up physical equity within their business that can be sold later. Therefore:

Embedded commissions and/or trailer fees are earned and owed to advisors.

10/ Historically, advisers have been assured they will not be paid 100% of their compensation earned so that money could be set aside to encourage above average job performance by rewarding those advisers with special perks, including travel.

Above average job performance, in reality, means that the adviser treats the job as a business and shows up for work every day. It is commonly called motivation.

- Perception or optics have nothing to do with it. Any individual or organization that twists the meaning of this type of compensation is wrong. Including the general public and the CSA.

The statements "these facts are mostly unproven" and "these facts are mostly true" along with "there may be a perception" is called political correctness and distorts the truth.

Note: Corporate Canada moved very quickly on this subject, not because it was right, but rather that it saves money by stealing promised compensation from advisers to enrich executive compensation and shareholder profit. Consumers saved nothing.

11/ Financial advisers are not compensated by the hour, rather by the project. They construct financial projects that house the finances of grandparents, parents, children and grandchildren. Not unlike a multi-family housing project.

They also build or are part of intricate corporate structures that range from Key Person compensation to Corporate expansion, restructuring, and acquisitions. Obviously, with this type of work, Advisers may make more than Doctors, at least in the year the deal closes.

In both of these examples, only the embedded compensation model can pay for the intellectual property offered in consumer/adviser relationships at a reasonable cost. Especially given the amount of "un-billable" intellectual knowledge and time required to complete any financial project. Note: the business is 24/7 and has never been 9 - 5.

12/ Canadians have choice of all the compensation models right now, upfront commissions, flat fees, hourly fees, fees based on a percentage of assets under administration or other arrangements. They need only search for the Adviser practice that offers it.

13/ Much of the CSA position on the matter of banning the embedded compensation model is sourced from the Australian and British compensation models.

We all know that both those countries compliance and regulatory regimes were weak, even non-existent compared to long standing Canadian standards.

Their problems have not been Canada's problems. One wonders at the motive behind the insistence of using them as an example.

14/ How much sympathy would the general public, given unbiased information, let alone a judge in a court of law view the banning of vested and non-vested revenues given the facts noted in this submission?

Failure to address the points in this submission opens up the very real possibility of a Class Action Lawsuit by affected advisers.

Summary

Embedded compensation such as commissions and trailers is the cheapest compensation model available to consumers. For them to pay advisers for the generally accepted employee rights that they themselves enjoy it would cost them significantly more.

Those that have not successfully worked in the financial services industry cannot claim to have "an inside perspective". Those that do only succeed to pass on negative if well-meaning and misdirected information. The knowledge gap and understanding of the business between failed and successful Advisers is to large to weight equally.

If the CSA truly believes good advisors, who provide value to their clients in exchange for compensation, will be able to transition away from embedded commissions and negotiate directly with their clients based on the value they provide are selectively ignoring the key points noted in this submission.

a Class Action Lawsuit would be advisers only recourse should a ban on commissions and trailers become an actuality.

Advisers deserve:

1/ Fair compensation for past years of service, pension and employment benefits that only the existing embedded compensation system provides.

2/ Recognition/compensation for hours worked and intellectual property that consumers and industry access that is not realistically billable.

3/ Stakeholder recognition that above average advisers should be paid more as they provide a higher level of intellectual knowledge enriching their clients and their country.

4/ The missing piece:

Compensation models are not part of the application process. They should be, including the embedded commission/trailer model.

Reviewed annually with the client, similar to an accountants practice. Along with mandatory disclosure and transparency rules in simple English/French.

Let the consumer decide what model they would like. It must not be dictated by third parties.

5/ Transition costs from one compensation model to another be born by the agency or organization driving the change if the end result is the banning of the embedded compensation model despite the facts noted in this submission.

6/ In the spirit of disclosure CSA should provide the names, job descriptions, work contact points income, benefit packages, and bonuses, including perks (like government hotel rates) of the entire CSA staff, management and stakeholders so that we can prove to Canadian consumers, that the agencies regulating our industry are acting fairly, transparently and in consumers best interests.

For further information or clarification please do not hesitate to contact the writer at the contact points noted below.

Excellent points.

It seems to me that what the CSA and others overlook is proper compensation for independent advisers. And if they were to be paid typical levels of benefits most Canadians automatically qualify for, including minimum wage especially in the early years of an advisers development, the benefit value of at least 25% increase would be added to consumers costs.

That 25% benefit annually compounded up to the YMPE, increasing each year would be far more expensive than the 2% fee for service model applied to small accounts. Let alone the 1% fee for service for large accounts. Yes, these fee's will drop with market pressures just like the CSA proposes creating an even larger gap in proper compensation.

Of course the embedded commission and trailer model if FEL zero is the cheapest consumer choice. Small accounts would attract Low Load or Back End Load which over a 8 year period is tyically the same cost as FEL zero. Considering investments should be a 10 year cycle a properly managed account is an excellent choice which saves considerable costs to the investor over the Benefits costs that a regular working Canadian enjoys.

CSA's proposals for banning commissions show an impressive lack of knowledge and understanding of even basic economic princples. Either that or its a masked attempt to eliminate the independent adviser market simply to enrich share holder value and management compensation of the Big Banks. I suspect pick one or the other depending upon who you talk to at the CSA and who will give an honest answer.

Obviously a strong case for a successful litigation within a Class Action lawsuit. There would be a long list of lawyers lining up as this would be a massive windfall for them.

April 20, 2017

A long list of lawyers lining up for a huge windfall from a class action suit?

Now there is a point that I missed in my comment on a new legal payment mandate. Perhaps we should ban all commissions (contingency fees) for lawyers as well.

The hypocrisy involved here is staggering.

Kenmar is an Ontario- based privately-funded organization focused on investment fund investor education via on-line research papers hosted at www.canadianfundwatch.com. Kenmar also publishes *the Fund OBSERVER* on a bi-weekly basis discussing investor protection issues primarily for investment fund investors. An affiliate, Kenmar Portfolio

Analytics, assists, on a no-charge basis, abused investors and/or their counsel in filing investor complaints and restitution claims.

We would be disingenuous if we said we were pleased to once again provide comments on this topic. Quite frankly, we are frustrated and disillusioned by the endless rounds of consultation. While our spirit is not broken, our determination and stamina is being tested to the limit. Nevertheless, Kenmar Associates is providing an input on this Consultation paper.

This CSA Consultation Paper pulls back the curtain to reveal the extent to which embedded commissions and industry structure impedes dealing representatives and others from being able to act in the best interests of their clients. We congratulate the CSA on the detail, statistics, commentary, research references and depth of the background data provided. The plain language exposition and adroit use of charts/tables may encourage more retail investor participation in this important Consultation.

Definition of trailing commission
According to our research there is no widely accepted definition of trailing commission in securities law. We believe that the Commissions and SRO's should agree on a common definition. The definition provided in Appendix B to the CSA Notice and Request for Comments on Proposed Amendments to NI 31-103 published on June 14, 2012 was as follows:
"“trailing commission” means any ongoing payment to a registered firm in respect of a security purchased for a client that is paid out of a management fee or other charge to the investment.” This makes it clear that the money is coming out of the investment which is key and that the dealer received such commissions directly as a result of sales to the investor. A trailer is just another form of compensation for sales. We take the definition of ***embedded commission*** to be the remuneration of dealers and their representatives for investment fund sales through commissions, including sales and trailing commissions, paid by investment fund managers .There is no reference to advice or services in this definition nor is there a definition of regulated advice. There is certainly not any disclosure of the services that dealers/advisors are to provide in exchange for the trailing commission.

Stated Rationale for consultation : The CSA's paper notes that embedded commissions incentivize dealers and reps to sell funds that pay higher trailers, such as "higher-risk actively- managed funds"; prevent investors from assessing the value they receive from their dealers; and "the cost of the advice and service provided may exceed its benefit to investors," among other things. These compensation structures also encourage fund management firms and fund managers to rely on payments to dealers to gather assets rather than investment performance. "This incentive can, in turn, lead to underperformance and drive up retail prices for investment products due to a competition between investment fund managers to offer attractive commissions to secure distribution." There is no question embedded commissions cause harm to clients.

The CSA has concluded that because these conflicts are both pervasive and difficult to manage, "a change to a different compensation model must be considered. Investors should be provided with a compensation model that empowers them and that better aligns the interests of investment fund managers, dealers and representatives with those of investors. The CSA's consultation paper also indicates that a ban on embedded commissions could also lead to increased price competition; lower fund management costs; a shift to lower-cost products, including passively-managed products; and, further innovation, among other effects, in addition to addressing concerns about conflicts-of-interest. The CSA wants direct payment for advice/service. Under direct pay arrangements, dealers and representatives could adopt various compensation arrangements, including upfront commissions, an hourly fee, a flat fee, a fee-based arrangement, or another suitable compensation arrangement, as long as the compensation is not embedded within the product and is paid exclusively by the investor.

In a 2014 survey of CFA Institute members representing a broad cross-section of investment professionals, Canadian CFA Institute members cited “misaligned incentives of investment management services” and “mis-selling by financial advisers” as the two most serious ethical issues facing the Canadian market in 2015. https://www.cfainstitute.org/Survey/gmss_2015_detailed_results.pdf

In NI81-408 there is no proposed rule or definitive plan of action. The CSA have stated that “what we are considering is eliminating embedded compensation on any "investment fund" under securities legislation, which would include mutual funds (MF), ETFs, closed end funds, pooled funds and structured notes. This would include any of these products, whether sold to retail investors under a prospectus or Fund Fact document, or whether sold on an exempt basis”.

At 2012, 39% of all households that owned investment funds were small investors (mass market households), 49% were midmarket households and the remaining 12% of fund owning households were affluent households.

Executive Summary

- Kenmar agree with the CSA on the harm a conflicted “advice” structure like embedded commissions cause retail investors. Any ffinancial incentives, including embedded commissions, that pay advisors/ dealers more to recommend one product rather than another compromise the quality, integrity and independence of advice. The advice gap that must be closed is the one between independent and compromised advice.The objective of breaking the link between conflicted investment advice and product ownership by discontinuing embedded commissions is a huge positive. We disagree however that co-operative marketing (funded by fund assets) should continue as it creates/maintains an unhealthy relationship between advice givers and product suppliers. We can see no rationale for retaining referral arrangements either as explained later in our detailed response.

- While we believe there will not be an expanded investment advice gap for small investors (defined by the CSA as mass market -less than $100k of investable assets) , the advice available may not be in the form that some small investors might prefer and it will still be subject to other conflicts-of-interest and product and service shelf limitations.
- DIY investors using discount brokers should benefit by paying a small transaction fee instead of an embedded commission ranging from 0.25% - I.25% for advice that is never provided.
- Mutual fund investors who do not engage with an advisor will benefit from a commission ban because they will no longer be involuntarily paying for advice they do not want, need or receive.
- Isolating the cost of advice from the product cost is a positive step but our anecdotal experience indicates a not insignificant segment of small investors is not uncomfortable with a tied-advice model and prefer it. A number feel that simply including the notional "advice" cost on monthly account statements as a footnote would satisfy their information needs. We believe a combination of convenience, complacency, detachment, a lack of understanding of the impact of conflict-of-interest on recommendations and unbridled trust in their advisor contribute to this attitude. It is about framing....how the deduction, the payment is framed and presented to clients.
- Small investors will be able to comparison shop but given the limited leverage, may not be able to negotiate advisory/account fees to a significant degree.
- The advice provided will still be subject to conflicts-of-interest, the suitability standard (where product cost is not an explicit factor), weak risk profiling and dealing representative proficiency shortcomings unless other regulatory reforms in CSA Consultation Paper 33-404 *Proposals to Enhance the Obligations of Advisers, Dealers, and Representatives Toward Their Clients* are simultaneously introduced. We agree with the CSA that discontinuing embedded commissions is complementary to CP 33-404.
- Integrated firms will be the big winners as the market share of independent fundcos without a dedicated distribution network could be adversely impacted with the elimination of embedded commissions. This leads us to the conclusion that (a) the percentage and number of non -proprietary funds available to retail investors will decline (b) a bias towards actively-managed mutual funds and closed-end funds will be maintained and (c) the migration to low-cost passive investing products such as Index funds and ETF’s will continue to be very slow among small investors.
- Advice fees would be unconstrained subject of course to market competition forces. Fee-based accounts could lead to higher fees but with the potential of lower product costs. Investor-abusing reverse churning, now in progress, will accelerate in the absence of a statutory Best interest advice standard and robust supervision/ compliance and regulatory enforcement. Basic elements of a best-interest process standard, include a clear definition of advice scope, advisor competency, a defined investment process, avoiding or controlling conflicts-of-interest; providing full, clear, meaningful and timely disclosure; interpreting laws and agreements in

manners favourable to clients' interests where conflicting interpretations arise; acting "with care", clear cost and performance reporting and a fair, responsive complaint handling system.

- Regulatory arbitrage with insurance products and some banking products will occur but will be limited assuming regulators make cooperation arrangements with their regulatory counterparts.
- The impact on portfolio managers' behaviour and fund performance is expected to be a positive for investors but we have no hard facts, research or evidence to make such a projection other than logic. (except for the obvious performance improvement resulting from removing embedded trailer costs from fund overheads)
- *NI81-105 Mutual Fund Sales Practices* needs an overhaul and expanded scope beyond mutual funds.
- Digital and online advice will be provided a positive environment for development and growth.
- In Ontario, new laws on financial planning, investment advice and title usage may amplify and accelerate the benefits of embedded commission prohibition in Ontario.
- Improved complaint handling rules and an OBSI with binding powers would be a powerful adjunct to this proposed rule.
- Robust and timely regulatory enforcement is a critical success factor. We cannot overemphasize the importance of enforcement by CSA members and especially the SRO'S. When regulations are added frequently but existing regulations are not enforced, this leads one to question the effectiveness of regulation and ultimately impacts confidence in the system both by the regulated and the general public. That is, until enforcement is carried out with the same vigour as new regulatory proposals, we are skeptical that the CSA's goals will be achieved.

Introduction

We treat this consultation on a stand-alone basis because there is no assurance that the CSA will move forward with targeted reforms or a Best interests standard. Indeed, without a clear idea of the CSA vision for the regulation of the Canadian investment advice industry, it is difficult to make robust commentary.

The consultation paper is not considering eliminating embedded commissions on any other products. Segregated funds, an insurance industry product, would be immunized from the prohibition but the CSA says it is working with insurance regulators to harmonize requirements where possible.

We would also recommend that the CSA task the MFDA and IIROC with forming partnerships with provincial insurance regulators as IIROC has done with the Ontario FSCO [Under the Memorandum of Understanding (MOU) agreed by IIROC and FSCO, the two regulators will share the decisions and sanctions of their respective disciplinary processes. Disciplinary decisions or actions taken by one regulator will trigger a review of the sanctioned individual's activities by the other regulator, including consideration of the suitability of the individual for approval, licensing or registration. This may result in an investigation or other appropriate disciplinary action. According to the MOU, IIROC and FSCO will also, where appropriate, conduct joint investigations and share relevant records and documents when both regulators are investigating the same individuals http://www.iiroc.ca/Documents/2016/5a43d68b-9b33-41b6-b426-87752566ae2b_en.pdf **We urge the CSA to consider this a major issue and take concrete steps to mitigate the risks of such regulatory arbitrage.**

Regulatory failures of the past have impaired the retirement income security of Canadians. If regulators had acted on the 1995 and 1998 Stromberg reports on the mutual fund industry, we wouldn't have the mess we have today. If the Fair Dealing Model proposed by the OSC in 2004 had been accepted by the CSA, Canadians would by now have a world class advice - based system. CSA characteristics include slow policy making, never-ending consultations and talking and continued "monitoring".

The Dec.15, 2016 announcements from the CSA, MFDA and IIROC portray a comprehensive system of incentives and inducements whose basic intent is to thwart the fundamental principle that registrants are required to deal fairly, honestly and in good faith with clients. That they have been allowed to exist is a reflection on the failure of regulators to protect investors.

Even as we prepare to respond to this consultation, we remain acutely aware that the CSA is a house divided on the Best interests standard for advice, even its definition. The portfolio construction, planning and management process (irrespective of its sophistication) and related financial planning should be conducted solely in the client's best interests. One hundred percent loyalty/focus should be dedicated to this objective. The dealing representative ("advisor ") should be responsible for the process and while the exchange, the point at which the client accepts the recommendation, in advisory relationships, remains the client's responsibility, this responsibility depends wholly on the integrity of the advisor's process. No conflict-of- interest should be allowed to impair the process. Canadian securities regulators remain stubbornly anchored around the transaction so the regulation of financial advice is sub-optimal.

If the pattern of the past is repeated, the new CMRA could be established and this initiative along with Best interests will die stillborn. We urge the CSA to make some firm decisions without undue delay.

Fees/Fee structures and their impact on advice and investors

With the evolution of the investment markets, technological change, an aging population, complex structured products, record high personal debt the key "RRSP rollover" decision point and increased longevity, investor risks and vulnerabilities are much greater than ever before. Canadian investors are highly vulnerable due to low financial literacy, information asymmetry vs. dealers/dealing Reps ("advisors"), investor overconfidence in their investing skills, blind trust in advice givers and a desperate search for yield in a low interest environment. Therefore, fee structures that exploit this vulnerability should be eliminated to the greatest extent practicable.

Based on the CSA review of current actively- managed fee-based (series F) fund offerings and their five year alphas, the data suggests that 87% of investment fund managers offering actively-managed funds today have some funds with negative alphas which could be at risk of redemption if embedded commissions were discontinued and these managers were not able to adjust their fees or improve performance. For active investment fund managers that manage funds with negative alphas, the proportion of assets at risk or redemption could be on average 53% of firm assets. This is truly a startling statistic given that "advisors" are the ones recommending these funds.

Independent academic research resoundingly supports the contention that mutual fund fees in Canada are among the highest in the world. A June 2015 **Morningstar report *Global Fund Investor Experience Study*** https://corporate.morningstar.com/US/documents/2015%20Global%20Fund%20Investor%20Experience.pdf shows that for Fees and Expenses, the highest-scoring country (that is, the country with the lowest costs) is the U.S., a position held since the start of this study in 2009 and reflective of the scale of this market and, as discussed later, sales practices. Australia and the Netherlands join the U.S. with an A grade. Among the lowest-scoring markets are Canada and China, which, while not the most expensive in all categories, do not have any category where fees are at an average or better level. Canada received a D- grade. This has a dramatic adverse impact on the savings and retirement income security for Canadians.

The CSA cited research has shown that mutual fund investors tend not to review disclosure documents for cost information and instead primarily rely on advisors to tell them about costs .Further research indicates that many advisors do not tell their clients about costs although this information gap may be partially closed by CRM2 reporting. While CRM2 reporting reforms are beneficial, they omit product costs, the TER and any DSC early redemption penalty payments. We therefore do not feel this reporting will get at the root of the problem .Further, most small retail clients will not be in any position to negotiate fees and perhaps most importantly, account/product cost(s) will not be an explicit factor in suitability assessments.

We therefore recommend that account and product cost(s) be made an explicit element of a suitability determination consistent with the targeted reforms.

We need to stand back and look at what we are actually paying for. If this is purely a transaction with the fee coming for the advice on the transaction, then in a competitive market place you should be able to buy mutual funds without the load and without the embedded trailer if an investor does not need or want the transaction advice. That is unfortunately not the prevailing model and therein lies the core of the issue [we are aware that a few online brokers may rebate trailers for a modest fee].

As independent research clearly shows, fees are the primary cause of sub-benchmark fund performance for A series units**.** RE Morningstar research: **How Expense Ratios and Star Ratings Predict Success** The report states **"***If there's anything in the whole world of mutual funds that you can take to the bank, it's that expense ratios help you make a better [purchase] decision. In every single time period and data point tested, low-cost funds beat high-cost funds.*" http://factualfin.com/blog/blog2.php/how-expense-ratios-and-star-ratings-pred To the extent that the breakdown of fund fee (and services) components are isolable, it is to that extent that investors will be better able to assess value for money for the advice and fund management components.

Embedded commissions are, in our view, primarily designed as a financial inducement for dealers to sell product (rather than advice), thereby increasing fee-attracting fund assets.

Embedded commissions constitute a fundamental conflict-of-interest. The conflict exists because it is the fund manufacturer that is paying the dealer conditional on a transaction taking place. In the first CSA consultation paper on fund fees (81-407, published Dec. 13, 2012) the CSA stated that using fund assets to pay for distribution gives rise to a conflict-of-interest for the investment fund manager. More specifically, the investment fund manager's use of fund assets (which are ultimately investor money) to pay for distribution and increase assets under management can benefit the investment fund manager by increasing their management fee revenue, but may not yield any benefit for the investor. The CSA are of the view that to the extent the investment fund manager would be the primary beneficiary of such a practice, and no corresponding benefit is passed on to investors, the investment fund manager may be at odds with their statutory duty to act in the best interests of the mutual fund and its investors. We agree with this assessment.

And of course trailers create a conflict for advisors in that funds with trailers may be more lucrative than other products and funds with higher trailers may skew recommendations even further. Embedded commissions can lead to mis-selling, thus reducing returns. e.g. use of high cost products, account churning, defective asset allocation and excessive leveraging. Excessive leveraging for example, creates a larger asset base which generates a larger trailer commission cash flow but dramatically increases investor risk exposure. It should be noted however that this same risk can occur in a fee-based account in the absence of a Best interests standard and robust compliance/enforcement.

The CSA also note there's no evidence to substantiate that investors can expect an increase in services and advice if their fund's trailer commissions rise. Trailer commissions paid are very loosely correlated with level of effort received if at all. Because of pooling of assets, large investors (affluent investors per CSA) subsidize smaller investors. With regards to affluent investors (more than $500k of investable assets), the CSA expect that they will be the least affected by the discontinuance of embedded commissions and would likely benefit from the expected decrease in fund management costs and the change in the habits of dealers.

The CSA state (pgs. 52/53)" Based on an analysis of low-cost fund product provider pricing in other markets, while taking into account pricing practices specific to Canada (e.g. tax differences such as the HST etc.), the estimates suggest that management expense ratios (MER) for index funds offered by these new entrants could be up to 40 bps lower than average index fund costs today. Also, MERs for actively- managed funds offered by these new entrants could be up to 75 bps lower than average actively-managed fund costs today. "If these numbers can be believed, such a reduction in A series fees would have a dramatic positive impact on the retirement income security of Canadians.

However, we must examine these claims since the details for making them are not revealed. Actively- managed funds, in their simplest form are offered as Series A and F. Series A is typically 2% and Series F is 1%. From the fundco perspective, 2% is 1% since fundcos are giving up 1% off the top, which is why F is 1%. So the paper seems to be saying the effect of these new entrants could be to reduce Series F management fees on equity funds to as low as 25 bps. That seems to be very ambitious. It is our understanding that even institutional investors don't pay that low on most strategies. And an institutional manager has much lower costs. We leave it to industry participants, fund analysts and others to assess this claim. In any event, we do expect product costs to continue to decline due to competition, the potential arrival of a Best interests standard, relentless media attention on fund costs and increased use of passively-managed products / actively- managed ETF's.

Embedded commissions are one among several causes of abusive salesperson behaviour, although lack of proficiency is also a major factor in the provision of bad advice (the UK RDR review came to a similar conclusion). In fact, Kenmar have been successful in a significant number of complaint cases against dealers/Reps based on incorrect advice on RRSP loan interest deductibility , misunderstanding ROC funds, mis-selling of leveraged ETF's, incorrect interpretation of TFSA rules and undifferentiated advice on RRSP's.

These examples are well delineated in MFDA and IIROC hearing panel decisions, media reports and in our quarterly *INVESTOR PROTECTION in Canada* reports going back over 5 years. **We therefore recommend that dealing representative proficiency be improved as integral to any decision prohibiting embedded commissions.**

There is surprisingly little statutory regulation of the financial advisor industry. Beyond the basic requirements arising from securities legislation across Canada, a wide range of *industry-based* rules and principles guide financial advisors. To achieve the desired outcomes sought by investors, we think the CSA constituents really have to amend the Securities Act(s) or set up a financial conduct or retail financial services regulator dedicated to regulating financial advice to retail investors. The targeted reforms appear to be an uncomfortable patch on a system really focussed on securities distribution not trusted investment advice.

Advisors and Advice

When we consult the rules, regulations and Bulletins of the CSA and the MFDA/IIROC we do not find regulations defining "advice" or the parameters in which that advice should be delivered, monitored and reported. Regulations relate mainly to issuance of securities and the rules and regulations governing their transactions and the rules and regulations governing the disclosure, sale and purchase of securities for individuals.

The CSA state "The term "advisor", as used in this Consultation Paper, is not indicative of an individual's category of registration with Canadian securities regulators, but is rather a plain language term that is commonly used by the public, including fund industry participants and investors, to refer to a representative" .In fact, it is a made up title that has deceived investors into believing that registrants have a best interests duty.

It is interesting to note that the CSA refer to a Dealing Representative, the official registration category, as a "salesperson " http://www.securities-administrators.ca/uploadedFiles/General/pdfs/UnderstandingRegistration_EN.pdf The ASC is more graphic: Persons who are registered under the Securities Act (Alberta) as Dealing Representatives (for example) are generally licensed to sell you products sold by the investment firm they work for, and are obligated to provide you with advice on the suitability of those products for your circumstances. In that sense, it's not unlike purchasing a car from a dealership. If you walk into a Volvo dealership, and explain your needs (four-door, certain horsepower) the person working there will suggest the most suitable Volvo for your needs. While they might have a small selection of other makes and models in their inventory, they are not required to know about, or recommend, any make or model that is not in their inventory that might meet your needs as well, or better. This is true no matter what job title they use, be that "personal banking associate," "investment representative," "investment specialist" or any other title. http://www.albertasecurities.com/investor/investor-resources/you-ascd-blog/Lists/Posts/Post.aspx?ID=63 These regulatory descriptions of dealing Representatives as salespersons are quite different than the descriptions portrayed by industry marketing materials to investors. See SIPA Report *Financial Advisor Fiduciary Illusion* http://www.sipa.ca/library/SIPAsubmissions/500%20SIPA%20REPORT%20-%20Financial%20Advisor%20Fiduciary%20Illusion%2020150502.pdf

Registrants are expected to recommend "suitable" investments per KYC / risk profiling and recommend "suitable" asset allocations. There does not appear to be any legal or other obligation to assist in budget/ debt management, provide lowest cost portfolio solutions, prepare an IPS, monitor the portfolio after the transaction or prepare a meaningful financial plan. Any advice relevant to income tax matters appears to be tilted to promote investment (e.g. RRSP loans) rather than providing a professional, well informed knowledge of tax laws. Marketing literature however suggests that such services may be provided but the real world is something else altogether.

Investors who unknowingly rely on conflicted salespersons as if they were trusted advisors can suffer real financial harm as such salespersons do not owe a fiduciary duty to investors. The cost on an individual basis, in the form of lost retirement savings, can amount to tens or even hundreds of thousands of dollars over a lifetime of investing, money that retirees struggling to make ends meet can ill afford to do without. In addition to paying higher costs, investors who rely on conflicted sales recommendations as if it were unbiased advice can end up facing unnecessary risks or receiving substandard returns as a result of numerous incentives that pervade the compensation system for "advisors". A major problem is that the CSA /IIROC/MFDA have allowed Approved Persons to hold themselves out as "advisors" and "financial planners" when there is no statutory obligation to act in the client's best interest- this is inherently misleading to financial consumers. **We recommend that the CSA take action that will address title misrepresentation.**

The mutual fund industry employs an arsenal of sophisticated techniques to market and sell mutual funds so it is understandable, in the absence of enforced protective regulations, that Canadians are paying a premium price for mutual funds. The bottom line is that the so-called "Wealth management "industry is not providing a robust or economic path for Canadians to accumulate wealth for retirement. Regulatory reforms are required and have been required for many years since the Stromberg Reports identified the key mis-selling issues in the late nineteen nineties.

It should also be noted that while embedded commissions are one cause of mutual fund under-performance, other so-called optional fees are not immaterial-sales loads, early redemption penalty fees, switch fees, currency conversion fees (in some registered accounts) and account transfer charges also take a nasty bite out of retail investor nest eggs.These fees are not regulated and could be increased to mitigate the loss of trailers.

But embedded commissions amount to about half the cost of owning an actively-managed equity mutual fund so rightfully draw the most attention. Across all mutual fund classes, prior CSA research found mutual fund management fees totaled $13.4-billion in 2011, with trailer commissions accounting for $4.6-billion or 34 % of the cost. At the end of 2011, the mutual fund industry managed $762 billion in assets on behalf of an estimated 12 million Canadians. The CSA now inform us that trailing commission paying fund series make up the bulk of mutual fund assets in Canada. At the end of 2015, trailing commission paying purchase options – back-end, low load, front end, and retail no load – made up 67% of assets and increased by 58% over the five years ending 2015. At 2016 the AUM figure has exploded to $1.3 trillion with an increase in trailers. Fundco trailer commissions provide a significant income stream to dealers for distribution of the funds to the retail market. Separating out the cost of "advice" should prompt attentive investors to assess the value of the "advice" obtained .This transparency would help explain some of the fierce industry opposition to a ban on embedded commissions.

As we shall demonstrate, Kenmar do not believe that a prohibition on trailers alone will put investors in a materially safer place. We support a statutory " Best interests " regime but suspect it is probably years away from reality given the lukewarm CSA support (except for the OSC and NBSC) and intense industry lobbying to prevent, delay or water down implementation. Continued use of the lowly suitability standard, prevailing dealer compensation practices and lax enforcement pretty well guarantees sub-optimal investor outcomes even if trailers are prohibited.

"Should you find yourself in a chronically leaking boat, energy devoted to changing vessels is likely to be more productive than energy devoted to patching leaks"-- Warren Buffett

It is our conviction that conflicts-of-interest are so fundamentally harmful that they should be dealt with now by regulators. Even with heightened investor awareness, the limited financial literacy and numeracy of Canadian mutual fund investors, information/knowledge asymmetry and perfected advisor sales pitches will keep ordinary Canadians vulnerable to mis-selling.

The Canadian experience and studies elsewhere in the world such as in the U.K. and Australia provide clear and convincing evidence that the standards for advice giving need to be upgraded**. We recommend that the CSA take action to enhance dealer rep proficiency per *CSA CP 33-404.***

In view of all the issues facing the fund industry the CSA is now , to our dismay, proposing to add alternative funds to the brew .Kenmar argues that no part of the CSA's Alt proposal should be allowed to proceed until salesperson proficiency, KYC tools , risk profiling and conduct standards in the industry are raised: The present securities regulatory framework does not provide adequate investor protection for mainstream products such as mutual funds, let alone complex products such as alternative funds. That being said, Kenmar do not oppose the introduction of Alt funds if they can help improve the risk-adjusted returns of clients. But first, the advice process needs to be more robust in order to recommend them to unsophisticated retail clients.

The Ontario Expert Committee's FINAL report
http://www.fin.gov.on.ca/en/consultations/fpfa/fpfa-final-report.pdf
describes the scheme of the recommendations as a "tripartite approach." Its three main pillars include: a new, harmonized regulatory framework for those who work in the industry; imposition of a duty to act in the best interests of clients; and upgraded and simplified titles and credentials for advisors based on heightened proficiency requirements. We feel the Ontario initiative on financial planning and advice and associated planner/ advisor registration could pay dividends for Ontarions. We urge the Ontario government to follow through as it would bring financial planning under regulation (as in Quebec) and have a common standard for insurance and investment advisors. It would improve investor protection and serve as a beacon for change for the other CSA members.

An Australian study ***Characteristics of trust in Personal financial planning***
https://www.griffith.edu.au/__data/assets/pdf_file/0004/868081/FPRJ-V2-ISS1-pp12-35-characteristics-of-trust-in-personal-financial-planning.pdf
utilises quantitative and qualitative research planning. The authors define trust in financial planning as "the expectation that the advisor (trustee) can be relied on to act

honestly, competently and in the best interests of the client (trustor) and thereby reduce the trustor's risk of loss" (Cull, 2015, p. 10). The paper identified seven primary characteristics of trust that were found to be essential to the client-advisor relationship in personal financial planning. Affective characteristics of trust were found to be essential to the client-advisor relationship. Increased legislation and specific behavioural and technical competencies of advisors were also found to build consumer trust in financial advice. The study's results provide guidance to financial advisors [and regulators] with regards to the skills and factors that build and maintain trust with clients.

This is why we argue that when advice is provided it must be free of conflicts –of-interest and be in the Best interests of the client. Trust in the financial advice process ultimately impacts on public confidence in Canadian capital markets and participation in the economy which assists in meeting broader economic and social objectives.

The CSA must deal with the conflicts issue holistically and not piece-meal. Trailers are the tip of the iceberg of a far larger problem in the wealth management industry. That is why we continue to insist on a statutory Best interests duty to clients and nothing less.

Until advice is actually regulated in some shape or form, financial advice standards are raised and financial advisors have a real professional body to define the proficiency, rules and regulations governing the provision of advice and to discipline and punish those who ignore them, the retail investor will need to be responsible for policing his/her own financial position- a Caveat Emptor environment.

The Canadian Retail Fund Investor Profile

The Canadian Securities Administrators' (CSA) 2016 edition of its investor education survey found that a growing number of Canadians are relying on advisors, with 56% reporting that they utilize an advisor, up from 43% in 2006 when the CSA first carried out the survey.

Moreover, investors cited advisors as their primary source of investing information and credited their advisors as the reason for reassessing their risk tolerance in the past year. The CSA survey found that 61% reviewed their level of risk tolerance during the year, up from 49% in 2012.

Retail mutual fund investors do not understand the adverse impact of fees over time i.e. the de- compounding of returns [studies show that the majority of series A mutual funds do not meet their benchmark over 10 or even 5 years]. This results in clients losing a significant amount of market returns over a 30-40 year investment horizon due to fees.

The 2012 OSC IEF study (pg. 28) found that 51% of investors had no view as to whether there was a conflict- of-interest or not. Among this group, the majority (29% not aware, 22% aware) indicated that they were not aware of all these sales commissions prior to the survey. Others said they were aware, but hadn't formed an opinion. Among the half of investors with an opinion on conflict -of-interest, an astonishing 73 % [36/49] believed that their advisor would look out for their best interest regardless of how the advisor was paid. This should be a BIG Red flag for regulators.

The study concluded "..Two-thirds of investors know little about their advisor when they enter into a relationship with that advisor. Only one-third gets to an advisor through a referral. The most common way to get an advisor is to have one assigned by a bank or financial institution. Investors trust this assigned advisor, because they trust their financial institution to do what is best for them..."

The sad fact is that most "advisors" are executing as salespersons with no regulatory requirement to provide financial planning, tax advice or indeed, any particular advisory service other than ensuring investment recommendations are "suitable".

At the end of 2012 just 37% of Canadian households held investment funds while the balance did not. In other words, two thirds of households would not be impacted in any way by a prohibition of embedded commissions. Further, at the end of 2012, just 22% of small investors (mass market) households held investment funds. These households will typically hold more conservative financial products instead such as cash GICs etc. Thus nearly four out of 5 small investors would be invariant to a ban on embedded commissions.

It should also be noted that mass market households are less likely to purchase their funds through an independent/ other fund distributor. At the end of 2012 only 14% of mass market households purchased their funds through an independent/ other fund distributor compared to 18% of households overall and 21% of affluent households. Mass market households were also much more likely to be solely purchasing their funds through a deposit taker/insurer owned dealer (83%) then were households with higher level of investable assets (i.e. 76% and 75% respectively for mid market and affluent households) .

As regards fees, a BCSC study confirms investors need to learn more about fees .The first phase of the research, which Innovative Research Group conducted on behalf of the BCSC, found that 28% of survey participants don't know how their advisors are paid while 36% are not familiar with the types of fees they pay. The survey also found that 51% of investors say they know what they paid in direct fees over the year, but just 34% know the impact of indirect fees on their investments. Furthermore, the research reveals that only 44% of survey participants understand that paying 1% more, or less, in fees will impact their returns.
http://www.bcsc.bc.ca/News/News_Releases/2017/06_BCSC_study_confirms_investors_need_to_learn_more_about_fees/ **This suggests that securities regulators need to do more targeted investor education on the de- compounding effect of fees on long -term returns**. An advantage of isolating the cost of advice from the product cost would in principle help engaged retail investors get a handle on their investing costs and the value of the advice provided.

The TD bank scandal reveals a lot about corporate culture

A recent CBC report about TD bank employees pressured to meet high sales quotas has touched off a strong reaction from clients, investor advocates and TD employees.

Hundreds of current and former TD Bank Group employees wrote to CBC's Go Public describing a pressure cooker environment they say is "poisoned," "stress inducing," "insane" and has "zero focus on ethics." Some employees admitted they broke the law, claiming they were desperate to earn points towards sales goals they have to reach every three months or risk being fired.

Employees unilaterally increased lines of credit, increased overdraft protection and increased VISA card limits in order to meet sales quotas. One financial advisor admits she acted in her own interest rather than that of her clients after being put on a Performance Improvement Plan - a program that involves coaching and could result in termination of employment - because she wasn't meeting her sales targets. "I have invested clients' savings into funds which were not suitable, because of the SR [sales revenue] pressure" she said. "That's very difficult to admit. I didn't do this lightly." A former TD financial advisor in Calgary says he would downplay the risk of products that gave him a big boost towards his quarterly goal. This is a major systemic issue akin to the Wells Fargo disaster in the U.S.

It will be very interesting to see how banking and securities regulators deal with this mess. Heads should roll, large fines imposed and all victims made whole. NOTES (1) Take a look at this 2013 IE article on TD's planned approach to compensation. ***Lower-producing advisors under fire*** http://www.investmentexecutive.com/-/lower-producing-advisors-under-fire?redirect=%2Fsearch Was this a predictor of the nasty things we see today?; (2) In Nov. 2014, three subsidiaries of Toronto-Dominion Bank agreed to repay at least $13.5-million to clients (10,000 accounts) who were overcharged on fees over the **past 14 years** and paid $650,000 to the OSC in a settlement deal over the wrongdoing and (3) TD Bank was one of the two banks who abandoned independent OBSI as soon as the Minister of Finance provided the opportunity for them to choose their own dispute resolution service.

And yet here we are reading this CSA consultation report on embedded commissions saying deposit –taker (bank) "advisors" work on a salary and are not compensated by trailer commissions. For us this tells us that while trailers are one important conflict of-interest, the real issue is a cultural one. Simply banning trailers will resolve little if there are multiple other sources of advice-skewing incentives backed up by disincentives supported by threats of termination at a branch.

Deposit- taker and insurer owned fund dealers dominate fund distribution in Canada. At the end of 2012, of the 37% of Canadian households that owned investment funds, 87% purchase their funds through a deposit taker/ insurer owned distributor while only 18% purchased their funds to an independent /other fund distributor (a small percentage of households purchase funds from both dealer groups).

To the extent the CSA believes bank branch "advisors" would make up any supposed "advice gap" caused by an embedded commission ban, it is to that extent we urge extreme caution.

Kenmar Response to Specific Consultation Questions

1. *Do you agree with the issues described in this Part? Why or why not?*
Yes, we agree with the embedded commission issues and their importance. CSA and independent research shows that conflicted advice harms investors. If an investor were to invest exclusively in mutual funds, we believe it would make sense to pay a fee if competent ongoing monitoring of the portfolio occurs. The broker or dealer would earn a clear fee as a result of that service. Prohibiting trailers will deal with this issue and will help bring clarity to the advice provided. Some investors may lose access to mutual funds that "advisors" sell with some of the highest fees in the world but will gain access to robo advisors or other direct fee payment methods with higher integrity advice. A recent poll from CARP found that 79% of its members opposed embedded fees with 40% strongly opposed. http://www.carp.ca/2017/04/20/new-poll-older-canadians-want-government-action-protect-life-savings/ When the advice fee is stated as a percentage it should be accompanied with a cost per $1000 metric. For consistency in nomenclature, the charge should be labelled "Service and advice fee" and recorded in dollars and cents on account statements.

We also concur that there is generally no linear or other relationship between the level of embedded trailer commissions set and paid by the investment fund manager to the dealer and the level (and/or quality) of services and advice the dealer and the representative provide to investors in exchange for such compensation .

In **Retail Financial Advice: Does One Size Fit All?** By Stephen Foerster, Juhani T. Linnainmaa, Brian T. Melzer, Alessandro Previtero NBER Working Paper No. 20712 November 2014 the authors conclude:
Using unique data on Canadian households, we assess the impact of financial advisors on their clients' portfolios. We find that advisors induce their clients to take more risk, thereby raising expected returns. On the other hand, we find limited evidence of customization: advisors direct clients into similar portfolios independent of their clients' risk preferences and stage in the life cycle. An advisor's own portfolio is a good predictor of the client's portfolio even after controlling for the client's characteristics. This one-size-fits-all advice does not come cheap. The average client pays more than 2.7% each year in fees and thus gives up all of the equity premium gained through increased risk-taking.
http://fbe.usc.edu/seminars/papers/F_10-3-14_LINNAINMAA.pdf It is important

that Canadians experience positive investment results because they depend on these investments for lifestyle and retirement purposes. If Canadians retire with insufficient wealth, they will ultimately have to be subsidized by the state. Our reading of current economic news suggests that this will lead to a significant deterioration in lifestyle for retirees (with commensurate effects on the economy as a whole, exacerbated by Canada's aging population) and that the state can ill afford to fund the retirement for more Canadians than it does now.

In the case of mutual funds, Fund Facts (FF) adds to the problem. If the CSA had listened to investor advocates, trailer commissions would be a distinct highly visible line item in Fund Facts, not subsumed in the MER - the cost of distribution would have made trailer payouts more visible. If regulators would have not mandated FF wording that the trailing commission involves the provision of "service and advice" we wouldn't now have to talk about the amount or quality of the recommendations. - the Simplified Prospectus merely said the manufacturer made a payment to the dealer without asserting it was for advice.

The CSA has also allowed meaningless disclosure of trailer commissions. As an example, the TD Balanced Growth fund Fund Facts document, says the trailing commission of this fund is 0-1%, not exactly a very informative fee disclosure for making an informed investment decision.
https://www.tdassetmanagement.com/Fund-Document/pdf/Fund-Facts/TD-Mutual-Funds/TDB970E.pdf The actual trailing commission (in effect the advertised cost of "advice") is a material fact that must be revealed in absolute terms not a range .It should tie in with the MER value in Fund Facts. A wide range of values is in fact not a disclosure at all. It is all well and fine to provide a consolidated number in dollars and cents via CRM2 once a year cost disclosure but the real need of the trailer commission disclosure is at the time of the investment decision. **We recommend Fund Facts reveal the actual trailer commission rate associated to the disclosed MER.**

We wish to point out that the CSA Fund Facts (FF) document does not contain a strong cautionary warning re conflict-of-interest as is the case in the equivalent SEC Summary Prospectus document.

Disclosure has noticeable drawbacks according to a recent study titled, "Consumer Decision-Making in Retail Investment Services: A Behavioural Economics Perspective[1]" (European Commission, 2010
http://ec.europa.eu/consumers/archive/strategy/docs/final_report_en.pdf
suggested that: "Our experimental results **raise doubts that disclosure can always be relied upon to help consumers understand that the advice that they are receiving may not necessarily reflect a choice that is solely in their own best interests..**

First, we find that the impact of disclosing conflicts-of-interest is context-dependent. **Online subjects hardly responded at all to disclosure of advisor remuneration**....Only those subjects who took more time over their decisions reacted appropriately **and even then only when the disclosure was flagged in a bold red font,** for the simplest of decisions.
In contrast, laboratory subjects, with more time and fewer distractions, exhibited a strong reaction to the disclosure of biased incentives, showing evident mistrust of advice. **Second, we find that full and transparent disclosure and/or a health warning may be necessary for people to properly understand the implications of the information being disclosed to them**. Online subjects, who were only told that their advisor was paid a commission, did not react to this disclosure unless it was accompanied by a health warning. **Laboratory subjects who were told the exact details of their advisor's remuneration structure responded to disclosure without such a warning**. Thus, the effectiveness of conflict-of-interest disclosure as a policy lever crucially depends on the precise form and content of that disclosure. **People do not appear to naturally recognise conflicts- of- interest and respond appropriately unless the implications are clearly spelled out to them in some fashion.**
Third, we find that disclosing conflicts-of- interest sometimes simply elicits a kneejerk reaction that can be harmful as well as helpful. Subjects in the laboratory exhibited contrarian behaviour in their investment choices when biased incentives were disclosed, investing significantly less in the recommended alternative."

Accordingly, we suggest something like the SEC disclosure: *"Payments to Broker-Dealers and Other Financial Intermediaries:* ***If you purchase the Fund through a broker-dealer or other financial intermediary (such as a bank), the Fund and its related companies may pay the intermediary for the sale of Fund shares and related services. These payments may create a conflict of interest by influencing the broker-dealer or other intermediary and your salesperson to recommend the Fund over another investment. Ask your salesperson or visit your financial intermediary's Web site for more information. Also see Distribution and Shareholder Servicing Plans in the prospectus and Distribution Agreement, Distribution Plan and Shareholder Servicing Plan and Additional Marketing and Support Payments in the Statement of Additional Information."***
We are well aware of the limitations of disclosure but feel a more powerful conflict-of-interest disclosure may have value. **Kenmar recommend the FF warning be significantly tightened up whether or not trailers are prohibited.**

Are Canadians receiving unbiased advice? It is interesting to note that at the end of 2015, just 1.5% of total mutual fund assets (excluding ETFs) were held in passively-managed lower cost funds. Despite all the available performance data and other virtues of indexing, the Index fund market share (advised accounts) has remained essentially unchanged over the last 10 years. However, among Discount/DIY fund series (non-advised), index funds made up a much larger share of assets (16% or $2 billion) that has been growing steadily over time. Why is this?

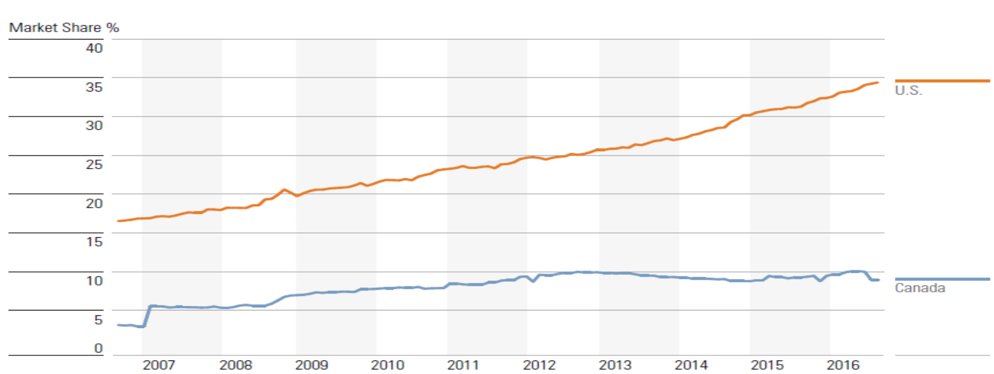
In **Why hasn't indexing taken root in Canada?** Morningstar Canada's Christopher Davis provides an aswer "...It's the incentives, stupid The same fund companies that have little incentive to offer index funds have given advisors little reason to use them. Paying advisors far larger commissions to sell clients active funds tilts the field against index funds. The commissions, which are built into the management-expense ratio (MER) and are commonly known as trailer fees, generally add another percentage point to the management fees paid to active stock funds but add half that amount (or less) to the price tag of index funds. (Commission-based series from ETF providers like iShares, PowerShares and Purpose Investments, which have 1% trailer fees, are an exception.) The commission-based business model is on the decline, but historically fund companies have paid advisors to sell costlier funds, and they've gotten their wish...." http://cawidgets.morningstar.ca/ArticleTemplate/ArticleGL.aspx?culture=en-CA&id=781441

After the United Kingdom banned trailing commissions in 2012, the trickle into passive funds turned into a flood. As Morningstar equity analyst Michael Wong noted in October 2015, passively managed UK assets increased approximately 140% from 2011 to June 2015, and market share significantly increased from about 7.4% to over 12%.

Why are low cost ETF's so small a fraction of Canadian portfolios? The main reason is that, with a few minor exceptions, they don't pay trailers. Another reason is that MFDA dealers aren't set up to sell them. That takes about 83,000 salespersons out of the picture. Quite amazingly, more than 25 years after the world's first listed ETF launched in Toronto, a better part of the country's dealer Reps still can't touch them. https://ca.finance.yahoo.com/news/why-hasnt-indexing-taken-root-100000240.html

The embedded commission and regulatory structures are key reasons passive investing isn't making traction in Canada. See this chart for the material difference in adoption rates:

Exhibit 1 Passive Market Share, Canada vs. United States



Source: Morningstar, Inc. Data as of 9/30/2016.

Active vs. Passive Investing in US and Canada Markets | Equities.com
Mystifying statistics –it appears Canadian advisors really love active management and/ or trailer commissions. https://www.equities.com/news/active-vs-passive-investing-in-us-and-canada-markets
2. *Are there other significant issues or harms related to embedded commissions? Please provide data to support your argument where possible.*

Given that most academic studies have found that the best predictor of a fund's return is its expense ratio, (i.e. funds with higher fees tend to underperform their competitors), and given the relatively low interest rate /return environment that is likely to persist, we fail to see how the advisors and dealers can claim to be acting in the client's best interests when profiting from third party payments which create compensation incentives to place consumers in high cost funds /funds-of-funds loaded with high cost proprietary actively-managed mutual funds. FofF funds take much of the load off the advisor so residual benefits of advice, if any, are primarily intangible. According to the consultation (pg 125), for the six years ending December 2015, funds-of-funds net sales totaled $191 billion versus $32 billion for traditional stand-alone funds. They have become the dominant product in the Canadian fund industry.

In some cases, the drive for trailer-commission sales leads to NAAF adulteration, signature forgery or asking clients to sign blank forms. The "signature falsification" (aka forgery) issue has become so bad that the MFDA were compelled to issue a Bulletin http://mfda.ca/notice/msn-0066/
to dealers on the subject. And this is the sales culture which is entrusted with advising on the retirement savings of millions of Canadians.

We provide anecdotal evidence from our friends in the industry concerning business practices that are currently in use or just recently implemented that can harm investors. These are not directly related to trailers and would survive even if trailers were banned. We have not been able to verify but we expect the CSA will want to follow through.

Ba**nk A**

- A branch received a transfer-in of an account that held a Bank B fund, which was one of the best performing funds in the account. The branch manager told the investment and retirement planner (IRP) to write a one page essay for the file on why he or she should keep the Bank B fund in the account. The Rep stated that he did not have the time and ended up selling the Bank B fund for one of Bank A's funds.

- On the dealer side, branch managers encourage their representatives to sell Bank A's funds. This is because the branch manager may get compensated higher if the representative sells proprietary products.

Bank B

- Branch managers promote the use of internal separately managed account (SMA) and unified managed account (UMA) platforms. Advisors charge higher fees and receive higher compensation for selling funds through these platforms as opposed to selling ISC funds.
- Bank B is now paying advisors less (as a percentage) of their mutual fund trailers than they are for their internal products and/or fee- based business. Bank B is considering both its internal platform fee based solutions, but the reality is Bank B is fund-of-funds (and fund of SMAs).
- The SMA platform has highly restricted fund offerings with an outsized number of solutions from the bank's own high fee products.
- Clients are often sold the SMA program with the discussion about the tax deductibility of fees. This is only smoke and mirrors as mutual funds deduct from the gross return as opposed to allowing clients to deduct their taxes on their own.

Bank C

- Bank C's investment advice channel's bonus structure is based on the percentage of Bank C's proprietary products held.
- Trailers are higher on the sales of the bank's managed mutual funds vs. its single fund solutions.

- If a client comes in to a branch with between $100K and $500K, the client will be referred to an FP, who can sell any mutual fund. However, Rep's are encouraged to sell the bank's own funds (80/20 rule). Once the Rep hits a certain amount of revenue, the FP will qualify for a trail (usually between 25 and 35 bps). Reps are encouraged to maintain an average trail of 95 bps, which is one reason why they are more apt to sell a managed fund than a single fund solution.
- If a Rep wants to sell a third party fund, the FP will need to justify to management the reason for doing so.

Bank D

- One wholesaler said that the bank is encouraging its Rep's to use its personal portfolio services program. Rep's get compensated by salary, bonus and other incentives (i.e. achievers' trips).

Bank E

- On the dealer side, advisors make more money from selling its multi-manager fund-of-funds. Performance is mediocre. Lower MER, but higher trailer.
- A branch Rep received a higher bonus because he was able to cross-sell a car loan and a premium credit card.

Dealer A

- Strong incentives in place for advisors to sell proprietary funds.

- If a client has a minimum amount invested in proprietary funds, the dealer will waive the annual account fee ($175). The account fee waiver also applies to TFSA and non-registered accounts.
- A Rep was offered a premium price for his customer book upon his retirement dependent on the amount and percentage of proprietary funds.

Dealer B

- Points program in place with a fund company and a number of other fund companies. For FundCo B's funds, advisors receive 4 points for every $10K invested. Points can be converted to FundCo B's shares or other incentives like trips, conference credits, travel and accommodation to Dealer C's conferences.
- Reps have a quota to sell FundCo B's funds. Once the quota is hit, advisors can sell third party funds.
- Advisors are incented to use managed solutions that are on their recommended list

Dealer C

- Advisors can qualify to buy into shares of FundCo C if a certain amount is invested in FundCo C's funds annually. Advisors can also win cruises.
- Advisors receive additional support through their total client experience. Total client experience includes practice management specialists and marketing tools (preferential treatment to guide their business).

Dealer D

- Advisors are incented to sell dealer funds. Advisors get a $5K bonus if they have $7M to $8M invested in its own funds.

3. *Are there significant benefits to embedded commissions such as access to advice, efficiency and cost effectiveness of business models, and heightened competition that may outweigh the issues or harms of embedded commissions in some or all circumstances? Please provide data to support your argument where possible.*

Trailers do provide access to conflicted "advice" , such as it is, for small accounts because they leverage cross-subsidization .The nature of the "advice" however is such that investors are sold actively- managed mutual funds that in most cases fail to match the performance of a portfolio of passive index funds AND are NOT sold lower cost products. As a result of conflicted advice, the retail investor return is significantly impaired over the long term.

In a very real sense, advice <u>not provided</u> is also harmful, yet investors are led to believe that representatives using a variety of misleading titles are acting in their best interests. One example we see far too often occurs when a Rep does not recommend that a client exploit the 50-100% contribution match provided by employee's company RSP plans. Another prime example occurs when we see chronic high balances of 18%+ credit card balances even as the Rep promotes increased monthly mutual fund purchases. This is what is passing for advice.

The conclusions of a 2015 Research paper **Is conflicted advice better than no advice?** can be summarized as follows:

ABSTRACT The answer depends on how broker clients would have invested in the absence of broker recommendations. To identify counterfactual retirement portfolios, we exploit time-series variation in access to brokers by new plan participants. When brokers are available, they are chosen by new participants who value recommendations on asset allocation and fund selection because they are less financially experienced. When brokers are no longer available, demand for Target-date funds (TDFs) increases differentially among participants with the highest predicted demand for brokers. Broker client portfolios earn significantly lower risk-adjusted returns and Sharpe ratios than matched portfolios based on TDFs—due in part to broker fees that average 0.90% per year—but offer similar levels of risk. More generally, the portfolios of participants with high predicted demand for brokers who lack access to brokers compares favorably to the portfolios of similar participants who had access to brokers when they joined. Exploiting across-fund variation in the level of broker fees, we find that broker clients allocate more dollars to higher fee funds. This finding increases our confidence that actual broker client portfolios reflect broker recommendations, and it highlights an agency conflict that can be eliminated when TDFs replace brokers.

Notwithstanding the conflicts, some dealing reps do assist clients with good general advice on saving, using TFSA accounts and diversification. We're not so sure about income tax advice, an unlicensed service. As regards tax advice for example, RRSPs are a terrible investment for low-modest income Canadians nearing retirement because most of the proceeds will be lost to taxes and clawbacks, according to a study by the C.D. Howe Institute. Study author Richard Shillington calls the situation "perverse" and urges financial advisors to stop spreading the myth that RRSPs are good for everyone. Many small retail investors are urged to set up an RRSP (using actively- managed mutual funds), without any differentiation or consideration of income tested benefits they might lose in retirement. See **New Poverty Traps: Means-Testing and Modest-Income Seniors** https://www.cdhowe.org/sites/default/files/attachments/research_papers/mixed/backgrounder_65.pdf . A Best interests standard coupled with increased dealing Rep proficiency would alleviate such bad advice /mis-selling.

We witness, with some notable exceptions, relatively little in professional personalized investment advice. Guidance is provided: "Buy-and-Hold: "Dollar cost averaging is the Best way to reduce risk", and the like but that guidance is only provided if an actively-managed mutual fund, often a proprietary one, is purchased and held. Some guidance is however clearly self-serving -"Invest in your RRSP", "Borrow to Invest" and "Active management is superior to indexing". Tied advice has a number of significant disadvantages for clients as we have articulated in this Comment letter. Cutting credit card debt or paying down the mortgage is rarely seen, at least in our interactions with unsophisticated retail fund investors over the past 15 years. Having client's pay directly for advice would at least in principle (a) provide clients with less biased advice and (b), prompt engaged investors to assess the services provided and results obtained vs the costs incurred. This is because a direct pay system makes the cost of advice more impactful compared to the disclosure of trailers in Fund Facts.

The alleged benefits of conflicted advice are intangible and in our opinion, supported by research, more than offset by the use of high cost products, unsuitable investments, early redemption penalties and the risks associated with undue leveraging. (in addition, the sales driven culture and slack enforcement motivates some dealing Reps to sell risky Off book products, engage in personal financial dealings and even effect outright fraud).

We have not been able to find convincing independent research to demonstrate that "advisors" actually contain bad investor behaviours as often cited by industry participants. In fact, a number of independent research papers suggest the opposite effect:

In their study, "Assessing the Costs and Benefits of Brokers in the Mutual Fund Industry," Daniel Bergstresser (Harvard Business School), John Chalmers (University of Oregon), and Peter Tufano (Harvard Business School) analyze a database of U.S. mutual funds from 1996 to 2004. Their objective was to compare the performance of investors who bought funds through broker-dealers to investors who purchased funds directly. They found that investors with broker-sold mutual funds experienced “lower risk-adjusted returns, even before subtracting distribution costs.” They also found that investors purchasing broker-sold funds were directed into funds with “substantially higher fees” and failed to show superior asset allocation. And as for helping investors avoid behavioral biases, “regrettably, the advisers generally demonstrated all the same biases that the rest of us have.”

According to Do financial advisors improve portfolio performance?, a study of German investors at Vox by university professors Andreas Hackethal, Michalis Haliassos and Tullio Jappelli. says they don't. The reason is the old bugaboo - costs and fees.Advisors add value but ... "*Even if advisors add value to the account, they collect more in fees and commissions than they contribute.*" Apparently the authors found that richer, older people tend to use advisors more which accounts for a preliminary gross conclusion that "*Investors who delegate portfolio management to a financial advisor achieve on average greater returns, lower risk, lower probabilities of losses and of substantial losses, and greater diversification through investments in mutual funds.*" They note that the financial industry would love to grab that statement for publicity. However, the net truth is completely opposite: "*Once we control for different characteristics of investors using financial advisors, we discover that advisors actually tend to lower returns, raise portfolio risk, increase the probabilities of losses, and increase trading frequency and portfolio turnover relative to what account owners of given characteristics tend to achieve on their own.*"

The estimated 6-7 year average hold period for mutual funds in Canada is an indicator of sorts that investor behaviour is not being contained by "advisors, one of the asserted benefits of “advice”. We have seen accounts churned, funds exchanged upon maturation of the DSC hold period, fund portfolios dramatically altered when a new advisor takes over an account etc. The bottom line is that retail investor accounts are not really behaving as long term investments. To be fair, these malpractices are due as much to regulatory failure as the presence of trailer commissions.

4. *For each of the following investment products, whether sold under a prospectus or in the exempt market under a prospectus exemption:*
- mutual fund
- *non-redeemable investment fund*
- *structured note*

should the product be subject to the discontinuation of embedded commissions? If not:
a. What would be the policy rationale for excluding it?
b. What would be the risk of regulatory arbitrage occurring in the exempt market if embedded commissions were discontinued for the product only when sold under prospectus?
Regulatory arbitrage is a material threat to the success of banning embedded commissions. Segregated funds in particular can be sold to unsuspecting investors by dual licensed "advisors" They can be portrayed as mutual funds to a novice investor. The problem is that fees are higher, disclosure is weaker, conduct rules are looser, enforcement is lighter and sanctions are lower.

Another important form of regulatory arbitrage occurs now when a complaint involves an investment portfolio containing a Segregated fund. The current system requires the complainant to file two complaints: one to OBSI and the other to OLHI for the Seg portion. This is abusive and likely will lead to a faulty conclusion. The CSA has to act on Recommendation 6 of the Independent Assessor: *That the OBSI and Ombudsman for Life & Health Insurance chief executives develop a joint approach to identifying and quantifying losses associated with segregated funds.* Source: https://www.obsi.ca/en/download/fm/539/filename/2016-Independent-Evaluation-Investment-Mandate-1465218315-e9fa5.pdf
Securities regulators need to take an aggressive pro-active stance to prevent regulatory failure.
5. *Are there specific types of mutual funds, non -redeemable investment funds or structured notes that should not be subject to the discontinuation of embedded commissions? Why?*

We are not aware of any. Some PPN’s issued by banks may have embedded commissions but they are not considered securities and do not assert they have any advice component. In any event, such products are protected via regulatory arbitrage since they are outside the mandate of the CSA

6. *Are there other types of investment products that should be subject to the discontinuation of embedded commissions? Why?*

We do not know .Perhaps it is time for a Segregated fund to be classified as a security under the Securities Act.

7. *Do you agree with the discontinuation of all payments made by persons or companies other than the investor in connection with the purchase or continued ownership of an investment fund security or structured note? Why or why not?*

We agree because it will not be possible to do away with commissions in Canada unless you can break the very strong link between product distribution and the investor, and "advisors" have fiduciary type responsibilities towards their clients. You pay for a service, and you pay for advice, and until you are actually paying for accountable and regulated advice and not the transaction, moving to a fee-only industry cannot happen effectively

We agree because we feel that it removes one significant, but far from exclusive, source of conflicts-of-interest. But, unless all conflicts –of-interest are removed, mis-selling will continue unabated. With trailers removed, at least Fund Facts disclosure will be greatly simplified allowing the document more real estate to better articulate investment strategy and properly disclose fund risks.

8. *Are there other fees or payments that we should consider discontinuing in connection with the purchase or continued ownership of an investment fund security or structured note, including: a. the payment of money and the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105; b. referral fees; and c. underwriting commissions.*
Why? What is the risk and magnitude of regulatory arbitrage through these types of fees and commissions?

First off, all the compensation conflicts identified in the Dec. 15th, 2016 CSA/IIROC/MFDA announcements must be eliminated as they are designed to thwart the basic law that dealers must deal fairly, honestly and in good faith with clients. The CSA announcement identified a whopping 18 advice- skewing compensation schemes.

We believe NI81-105 needs a complete update and should be expanded to at least cover all the securities mentioned in this consultation. It is not clear to us why its provisions are not applied to all sales recommendations regardless of product.

Kenmar are of the view that if dealers want to be considered as trusted wealth managers, they should not participate in co-operative marketing programs with suppliers. We see no rationale for fund assets to be used for sales pitches by suppliers. Any "educational" seminars should be presented solely as a wealth manager.

We have a strong view on referral fees. Referral arrangements create an environment where dealer representatives are incented to sell products /loans/services to clients whether they need them or not. *As the CSA paper observes "In the case of related party* *referral arrangements, it may encourage representatives to send their clients to another arm of their firm, even when third party product and/or service options may be more suitable. It may also encourage representatives to shift clients to more profitable business lines within the firm with little or no benefit to the client."* By not addressing referral fees , it just seems to us that regulators have provided dealers with a back-door way to achieve what they have been achieving through the front door. The CSA state "We acknowledge that the above types of payments may give rise to conflicts of interest that may continue to incent registrant behavior that does not favour investor interests". So why in the world would referral fees be allowed to continue? A quick look at the BNS referral disclosure document http://www.scotiabank.com/ca/common/pdf/scotiamcleod/Referral-Disclosures-82014612_eng_0211.pdf presents so many bear traps for the unsuspecting retail investor it is hard to imagine he/she would escape unscathed. People are looking for trusted investment advice on their life savings and it is the duty of regulators to provide them a safe environment for doing so.

If there is one referral fee that should be banned it would be the referral that supports leveraging. It is our understanding that one bank, noted for leveraged lending, counts 27,000 advisors among its clientele. According to the consultation paper, dealers may receive a referral fee from the financial institution in connection with their client's loan in addition to the 5% upfront commission (plus the ongoing trailing commission) they may receive from the investment fund manager on the purchase transaction- this encourages undue and risky leveraging recommendations.

This bank offers a 3 for 1 investment loan (!) and loans for RRSP's. Visit https://b2bbank.com/sn_uploads/forms/0817-07-203E_B2B_BANK_Investment_Loan_Application.pdf for details. It is hard to see how such loans could ever be in the retail investors' Best interests. Allowing referral fees for such loans just perpetuates the bad culture that permeates Bay Street. **We therefore recommend (a) that referral fees for investment loans be prohibited and (b) account fees in fee-based accounts should be based on net assets as has been implemented by Australian regulators.**

As for underwriting commissions for closed-end funds, it seems to us that such commissions are clearly for distribution and as such reasonable investor protection can be achieved via quality disclosure and suitability criteria. A problem can arise when an IPO is sold within a fee-based account – we leave it to regulators to decide on such cases. In a closed-end fund, the underwriting is pretty basic yet it still seems to attract a similar fee as for a corporate issuer IPO. That just doesn't make sense. Yet, under the prevailing suitability standard such a transaction would be perfectly acceptable. Under a Best interests standard, we doubt such transactions would pass muster.

Investors today are having a difficult time using and employing the CSA aretheyregistered web site. SIPA have documented the many issues in their report http://www.sipa.ca/library/SIPAsubmissions/500_SIPA_REPORT_REGISTRATION-Above-

the-Law_201611.pdf Should embedded commissions be banned, we would expect an exponential increase in use of the site. In any event, **it is imperative that the CSA repair work begin now**. These points are especially important:
:

- The CSA should ensure that Reg check makes it crystal clear when a person is dually registered.
- Reg check should also be kept up to date in near real time*.
- The CSA should issue an investor ALERT regarding dual registration including potential risks.
- Dealers should be required to inform clients in writing if a registrant is dually registered.
- Regulators should examine all rules to see if provisions are adequate to enforce cases where investment assets are redeemed to purchase Seg funds (or life insurance/ annuities).
- Regulators should have a clear privacy policy that the KYC information can only be used to effect actions regarding securities unless client consent has been obtained to use the information for another purpose.
- Finally, regulators might tighten the criteria for approval of a dual-occupation registrant that would include provisions that mitigate regulatory arbitrage.

* There are major holes in the database's records. As of May 26, 2016, the NRD is missing penalty information for at least 51 people disciplined by IIROC and the MFDA between January 1, 2013 and December 31, 2015—including permanent bans. That's 18% of all reps who faced discipline during that period. http://www.advisor.ca/news/industry-news/hidden-in-plain-sight-how-banned-iiroc-and-mfda-advisors-can-still-sell-insurance-207496

9. *If payments and non-monetary benefits to dealers and representatives for marketing and educational practices under Part 5 of NI 81-105 are maintained further to the discontinuation of embedded commissions, should we change the scope of those payments and benefits in any way? If so, why?*

We believe such payments and benefits can only lead to trouble and should be prohibited. There should never be financial/non-financial direct relationship of a supplier with staff of an advisory firm. We are told by trusted industry participants that before the Sentry case there had never been any enforcement of this Instrument since its release in 1998. [As we read the April 5, 2017 Sentry Securities Inc. Settlement Agreement http://www.osc.gov.on.ca/en/Proceedings_enr_20170405_sentry.htm our eyes glaze over. The "conference", which was held in September 2015, included a party for advisors at a mansion in Beverly Hills that cost the firm more than US$1,000 per guest; gifts of Dom Perignon champagne and jewelry from Tiffany & Co., along with golf outings, a wine tasting and movie studio tour provided at the firm's expense. In total, the conference cost Sentry $2 million. The OSC settlement agreement also indicates that Sentry spent excessively on gifts for reps, exceeding $4,000 a year for some reps, on items such as tickets to concerts, hockey, baseball and basketball games, along with other gifts. Furthermore, the OSC alleged that Driscoll provided a rep with tickets to the Montreal Grand Prix in 2015 and 2016, which also violated the rules.]

In OSC STAFF NOTICE 33-743 GUIDANCE ON SALES PRACTICES, EXPENSE ALLOCATION AND OTHER RELEVANT AREAS DEVELOPED FROM THE RESULTS OF THE TARGETED REVIEW OF LARGE INVESTMENT FUND MANAGERS http://www.westlawecarswell.com/oscb/on3725/on3725-1.htm the OSC looked closely at certain aspects of sales practices including cooperative marketing practices, mutual fund sales conferences and fund manager participation in the sponsoring of dealer events. What investment fund managers can and cannot do is spelled out in *National Instrument 81-105 Mutual Fund Sales Practices*, which has been around since 1998. Its purpose was to discourage sales practices and compensation arrangements that raised the question as to whether the clients' interests rather than those of the sellers were being addressed. Fund managers can pay a portion of the costs of an investor conference or seminar that a dealer puts on for investors. However, the Staff Notice says there was a 25% incidence rate where "cooperative marketing practices did not meet the primary purpose of promoting or providing educational information concerning a mutual fund, a mutual fund family or mutual funds generally in order to be eligible for support. "Staff also had concerns regarding mutual fund sponsored conferences. Fund managers are prohibited from paying travel and accommodations expenses of sales representatives, yet there was a 50% incidence rate of this occurring. Similarly, non-monetary benefits such as meals and entertainment were deemed excessive.

The CSA is well aware that so-called "Free lunch" educational seminars co-sponsored by fundcos are thinly disguised sales pitches. These seminars may be invitation-only or they may be advertised in local papers or on the internet." Free lunch "seminars are often held at hotels or restaurants and may offer enticements such as free meals, books, or trips for attendees. In effect, they are perceived as "recommendations" by clients. Such Co-operative marketing ventures have been shown to have little real value for investors and in fact have led to several problems. Dealers ("wealth managers") should not receive payments from product suppliers especially using fund assets. See **Free Lunch Seminar Report**: AARP 2009
http://www.aarp.org/work/retirement-planning/info-11-2009/freelunch.html

We expect that if the OSC had performed a compliance sweep on NI81-105 compensation practice provisions, the results would have been jaw-dropping.

10. *With respect to internal transfer payments:*
a. How effective is NI 81-105 in regulating payments within integrated financial service providers such that there is a level playing field for proprietary funds and third party funds?
Regulation and enforcement of these payments via the 1998 version of NI81-105 would appear to be ineffective based on observed results.

Per a 2013 Invesco Comment letter "*We understand that some dealers construct "recommended lists" of mutual fund investments for their clients and sales of recommended list funds generate a higher grid payout than funds not on the list and that*

some third party funds do appear on recommended lists. However, we suspect that all proprietary funds are also on the list and this enables the dealer to legally evade subsection 4.1(1) of NI81-105. It appears that the CSA has condoned this practice since it makes the assertion regarding grid payments without commenting on the legality or ethics of the practice. To put it mildly, we are disappointed with the CSA in that regard. We also note that lack of enforcement on that point sends the message to all capital markets participants that, under Ontario securities law and the securities laws of other provinces, it is acceptable to do indirectly what you cannot do directly…"
http://www.osc.gov.on.ca/documents/en/Securities-Category8-Comments/com_20130412_81-407_adelsone.pdf

We recommend that dealing representatives from integrated firms exclusively selling proprietary products be given a descriptive label (e.g. "salesperson") that distinguishes them from true independent advisors/wealth managers so that investors know the limitations and constraints of the "advice" provided.

A major finding of the Cumming report was that "Funds that sell more through affiliated dealers tend to perform worse…funds which receive higher levels of affiliated dealer flows experience lower future alpha on average." (page 9). i.e. the research indicates that mutual fund sales through affiliated dealers appear to have weaker connections to past performance, which is associated with weaker future returns.

This suggests that conflicts-of-interest are at play, which lowers incentives to generate flow via improvement in performance (page 63). This appears to demonstrate that when dealer representatives can only sell proprietary products or are incented to sell the product of the manufacturer that the advisor's dealer is affiliated with, the retail investor is worse off. This is not surprising because the Rep, say at a bank-owned dealer (branch), is restricted in the products that he or she can recommend.
b. *Should internal transfer payments to dealers within integrated financial service providers that are tied to an investor's purchase or continued ownership of an investment fund security or structured note be discontinued? Why or why not? To what extent do integrated financial service providers directly or indirectly provide internal transfer payments to their affiliated dealers and their representatives to incent the distribution of their products?*

We do not have clear visibility on the nature of these transfers but we can say that they effectively transform advice-skewing trailers to dealers into respectable salary plus bonus payments to dealing Reps. Such payouts may not be related to specific transactions but they must surely in aggregate be closely related to the dollar value of the transactions effected by the Rep. They certainly drive the rules, policies and motivations of the affiliated dealer. The CSA should be constructively critical of these internal transfers and the basis upon which they are made. If internal transfer are allowed, then it seems to us that the incentives continue but in a different, more sophisticated form.

c. *Are there types of internal transfer payments that are not tied to an investor's purchase or continued ownership of an investment fund security or structured note that should be discontinued?*
We do not have sufficient information on which to comment.
11. *If we were to discontinue embedded commissions, please comment on whether we should allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf.*

Continuing to allow payments between affiliated dealers and manufacturers is controversial and shows that regulators need to probe much deeper into these arrangements. Such a system defeats the whole purpose of separating advice from transactions (using fund assets to finance distribution), thereby not empowering the retail investor.

We should mention an Invesco approach to deal with this issue We have been informed that a few years ago they introduced something called Flexible F or an Investment Advisory Fee (IAF). In these arrangements, the dealer and client "negotiate" a fee (to the same extent as for a fee-based account) and sign an agreement with them and Invesco collect the IAF from the investor on behalf of the dealer. So the investor knows they are paying because (a) they agreed to it in a contract, (b) the contract is very simple and short (c) it shows up on their monthly or quarterly statement, as the case may be. Invesco have no participation in the amount of the fee. On the upside, however, Invesco will not honour the IAF – and they say so in the prospectus and otherwise – if the fee exceeds 1.5%. It appears that a client would have to sign an IAF for each fund family of interest which may place a paper burden on clients and dealers. The CSA may wish to examine this approach and assess the issues associated with it.

12. *Based on a consideration of the data and evidence provided in this Part, would a proposal to discontinue embedded commissions address the three key investor protection and market efficiency issues discussed in Part 2?*
They would address the primary issues <u>but only if the proposed CSA targeted reforms/BI are implemented and meaningful and timely regulatory enforcement is applied</u>.
13. *Are there other ways in which the CSA could address these issues that could be introduced in conjunction with, or separate from, the discontinuation of embedded commissions?*
We are unable to provide a better alternative.
14. *Are there other conflicts-of-interest that could emerge following a transition to direct pay arrangements that would not be addressed in the current securities regulation framework?*
It's not that other conflicts-of-interest will emerge, they exist in plain sight today. The report from the Canadian Securities Administrators (CSA), the Investment Industry Regulatory Organization of Canada (IIROC) and the Mutual Fund Dealers Association of Canada (MFDA) examined the various compensation arrangements in the retail investment business and the conflicts they can create, including a bias for proprietary

products and incentives to sell products that may violate suitability standards. The long list of advice- skewing incentives and inducements was in our view, quite shocking. Even more shocking was the matter of fact lack of reaction and concern by regulators. These arrangements go well beyond the embedded commission issue and cry out for firm, prompt and decisive regulatory action, not more monitoring. One has to question why there has been so little enforcement.

A glance at the IG Simplified Prospects, pages 31 and 32 shows a large number of non-trailer influencers that could skew the advice provided https://www.investorsgroup.com/en/documents/corp/regulatory/prospectus-guides/c2994.pdf . viz "We may also pay prize awards and performance bonuses to your Investors Group Consultant, or provide credits that may be paid in cash or used towards a variety of business, benefit and education-related expenses, based on the dollar amount of the various products and investments distributed or serviced by the Investors Group Consultant during the year, as well as bonuses for career achievements such as obtaining an educational designation, or licence or for program completion. Some prizes and bonuses paid for Investors Group Funds may be higher than those paid for other products. Also, your Investors Group Consultant may own, directly or indirectly, shares of IGM Financial Inc."

A 2016 IIROC report commented on dealer control over compensation related conflicts It stated: "...However, when it came to compensation-related conflicts, most firms sampled lacked a meaningful process to identify, deal with, monitor and supervise compensation-related conflicts. For example, most firms did not have mechanisms in place to identify advisors who recommend products that yield higher fees and bonuses, when there are other suitable but less expensive alternatives available. They also did not have a process in place for implementing additional monitoring of advisors approaching compensation thresholds based on the amount of revenue generated. Furthermore, we found that there was confusion among some firms regarding the best interest standard as set out in our conflicts of interest rule and guidance. Although most Dealer Members responded that they always put clients' best interests first, we found little supporting documentation as far as compensation-related conflicts were concerned. .."
http://www.iiroc.ca/Documents/2016/F58C9465-AFC5-42F3-A5D1-6C5BFDF19CF3_en.pdf Without a defined process for managing advisor compensation-related conflicts actions and inactions, we fail to see how robust advice can be provided. The best solution is to avoid such conflicts to the greatest extent practicable.

The Brondesbury Group Report, "Mutual Fund Fees Research", Spring 2015, https://www.securitiesadministrators.ca/uploadedFiles/General/pdfs/Brondesbury%20Mutual%20Fund%20Fee%20Research%20Report_e_ngwr.pdf was quite clear in one respect: the literature shows trailers generate conflicts but there is insufficient research on conflicts in fee-based accounts, so we really don't know what the conflicts are. Brondesbury had cautioned against shifting to that model without studying the conflicts. To our knowledge no one has done so. We have repeatedly identified two conflicts: higher fees for advice; reverse churning.

According to the Brondesbury report "All forms of compensation affect advice and outcomes". But not all forms of compensation are equal. For instance, advice delivered under a suitability standard and paid for by trailers is likely to have a worse investor outcome than advice delivered under a direct-pay Best interest standard. Advice from a bank branch dealer collecting trailers would on average be expected to be worse than advice coming from a dealer with a suite of competitive non-proprietary products. Advice provided by a direct pay compensation method is more likely than not to lead to better long-term client outcomes because the client will have a better capability to measure results vs. advisory fees and take timely remedial actions.

15. *What effect do you think the removal of embedded commissions will have on investor experience and outcomes? In particular:*

• *Will investors receive advice and financial services that are more aligned with the fees they pay?*

In theory they might if a documented fee and service schedule is provided and clients are alert. Informed clients could then assess whether the services provided are worth the money. They could at least in principle, comparison shop but we do not expect small retail clients to have much leverage in negotiating fees. NOTE: Since a multitude of other conflicts-of-interest will be omnipresent, we remain constructively critical that many unsophisticated retail investors will be able to assess the quality and integrity of the advice provided.

Kenmar is of the view that advisors also have a potential conflict-of-interest due to the possibility of higher trailing commissions from increased sales of a particular category of fund. For example, since trailing commissions on equity mutual funds are typically higher than those on fixed income or money market funds, advisors may have an incentive to favour such equity mutual funds in portfolio allocations. The resulting unbalanced portfolio would not correlate well with the client risk profile, itself based on a flawed process in the majority of cases. The removal of trailers should have a positive impact on investor experience and outcomes with the provisos surrounding fee-based accounts.

• *What effect will the proposal have on the growth of automated advice? Is this likely to be beneficial to investors?*

We believe automated investment advice will see an increase in interest once the true cost of investment advice and the services actually provided become clear to investors. This could be beneficial for small investors because of lower costs and avoidance of abusive dealer/advisor sales practices.

• *Is discretionary advice likely to increase in Canada as we have seen in the other markets that have transitioned away from embedded commissions and, if so, would this shift be positive or negative for investors?*

Reversion to discretionary is potentially a real issue. What happens is IIROC-licensed reps end up providing discretionary advice, like a PM would. The wording of the proficiency standard is similar but not quite and leaves the potential for abuse. Discretionary could be positive, but it could also be a negative outcome, depending on fees (and clarity on fiduciary duty). There is also the issue of competency. A PM for a fundco spends almost all of his/her time monitoring the portfolio and researching investments. The discretionary advisor at a dealer does not. They don't have the infrastructure really to do those activities -they tend to rely on dealer research, and have no real investment style. We have a hard time believing clients are better off using discretionary. One should contrast that with Private Investment Counsel shops who do the same things as fundco PMs and who are very open and upfront with potential clients about the investment approach, expectations and fees. The problem is cost – they won't take on accounts under $1 million typically.

• *What effect will the proposal have on the growth of the online/discount brokerage channel and cost of fund products offered in this channel? Is this likely to be beneficial to investors?*
From early feedback, we believe that a not insignificant number of people will explore the use of discount brokers as a result of CRM2 sticker shock and unrelenting media reports of advisor wrongdoing. Some will come as orphans as IIROC dealers trim their client base to focus on larger accounts. We believe banning trailers will cause the smaller account clients to consider going DIY with all or at least a portion of their investments. This could be beneficial for investors as long as IIROC does not curtail the many innovative features, guidance and tools these firms have created. A concern: With trailers banned, at what price will discount brokers sell mutual funds?

We are encouraged to see the OSC announcement of its LaunchPad program to help new tech firms develop their business models in a compliant fashion. It appears that the OSC will try to be flexible on regulations, allowing time-limited registrations or exemptions for companies to test new models. Kenmar support this initiative to support the development of online advice, robos and discount brokers. This can only benefit investors.
• *What effect will the proposal have on the cost and scope of advice provided to specific investor segments?*
This is very difficult for us to project.

We suspect a number of questionable products may be dropped. For example, BMO, the country's second-largest ETF provider, wraps its moderately priced ETFs in high-priced mutual funds before selling them at bank branches. Removal of the trailer may assist in reducing the number of such products from the market BUT they might end up in a 1.5 % SMA or fee-based account unless a Best interests standard also comes into force. This is why we keep saying that banning trailers on a stand a-lone basis will not be effective and could have adverse consequences.

It is not unreasonable to expect removal of embedded commissions will spur innovation, cost reduction, more use of automated advice and mobile platforms, especially for millennials. We fully expect Canadian industry creativity to be as creative as those in other jurisdictions. If the uptake of robos in the U.S. is any indication, it should prosper here given our higher mutual fund costs.

Advice Fees may rise but we do not see a corresponding change in the scope of advice provided for small investors. It is anticipated that any increase in fees will be more than offset by use of lower cost products but this should not be taken for granted. That is why we continue to demand a statutory BI standard be implemented.

At first there will be some consternation of the change especially since investors have been told "advice" is free. It will take some time for the system to settle down, perhaps as long as 6 -9 months or even longer. The CSA will have a role is providing investor education. Some fraction of small investors may decide they don't want or need investment advice at the prices on offer. We continue to make the point that investors with say $25,000 or less to invest may not need much in the way of investment advice. For them paying down debt, cutting household expenses, investing with an indexing firm like Tangerine or a robo may be more than an adequate solution until their investable cash increases and/or their financial situation becomes more complex. We would also expect that the Money Coaches sector would be given a boost if trailers are banned.

A comprehensive CSA communications program will be needed to support the transition period.

While we are cool to financial literacy initiatives we are excited about financial capability. It is our opinion that Canadians need as much support or more for holistic financial planning than advice on investments. In this regard **we recommend that the CSA formally partner with the FCAC to develop easy to use plain language tools, calculators, checklists related to the most common financial issues that will assist Canadians with modest savings to take control of their own financial destiny.**

16. *What types of payment arrangements are likely to result if this proposal is adopted? In particular:*
• *Would the payment arrangements offered by dealers to investors differ based on investor segment? If so, how and why?*
We don't know but the industry is creative. We expect they will find a solution for each segment and channel. A huge concern of course is that people, especially seniors, will be herded into fee-based or other types of accounts that are not suitable for their needs. It will be up to the regulators to ensure that creativity doesn't make the situation worse than it is now. We point out that front-end load payments are in use now and will continue to be permitted according to this consultation.
17. *Do you think this proposal will lead to an advice gap? In particular:*
•*Which segments of the market are likely to be affected?*
Please consider segmentation by wealth, geography (size and location of community e.g. remote, small, medium, large), age, technological sophistication, the level of fund ownership across households, etc.

There has long been an "advice gap" in the industry, where full-service advice is much more likely to be available for large accounts and not small accounts. That reflects the economic reality that getting lots of good quality advice is expensive and not everyone can afford to pay for much of it. There is a gap between what advice investors are actually receiving vs. what they expect (professional unbiased advice). There is a gap between what advice clients are receiving and what they really need (a simple financial plan, low cost simple products). For many, there is a gap between what they are paying for advice and the level of effort applied to their situation.

According to the J.D. Power 2016 Canadian Full Service Investor Satisfaction Study, SM despite Canada's wealth management industry promoting a goals-based approach to advice, nearly half of full service Canadian investors say their advisors fail to deliver on even the first stage of that process, which helps them set goals that reflect their risk tolerance. The study identifies three broad stages of goals-based investing: setting personal goals; implementing a strategy to achieve those goals; and monitoring progress. Only slightly more than half (54%) of investors indicate their advisor helped set goals and discussed risk. **Barely one-third (34%) say their advisor effectively delivered on all three stages.** Additionally, despite all the attention on transparency around fees with CRM2, just 27% of investors say they "completely" understand their fees, down from 30% in 2012 http://canada.jdpower.com/press-releases/jd-power-2016-canadian-full-service-investor-satisfaction-study

Respected fund industry observer Dan Hallett states in **Advice gap exists now** http://www.investmentexecutive.com/-/advice-gap-exists-now?redirect=%2Fsearch :"...Most advisors segment their client roster. This results in larger accounts getting a lot more attention than smaller ones, who are lucky to get one face-to-face meeting each year. (These assumptions are based on IE's surveys.) I know of advisors with 500 or more clients. Yet, practice and relationship-management experts suggest a maximum of 75 to 125 client relationships per advisor.As a result, clients with smaller accounts get little or no ongoing advice because the economic realities force advisors to focus on giving more service to larger accounts. So, there probably is an advice gap problem for smaller accounts already. They technically are "on the books" of an advisor. And even if we assume that they receive good advice up front, economics equate to little or no ongoing interactions and follow-up...." This situation matches our experiences. The "advice gap" is a theoretical construct developed by industry participants wanting to retain embedded commissions.

It's been suggested that in an environment without trailers, some small (say less than $50,000 in investable assets) investors may not get any service whatsoever. A case in point would be the investor who invests $50,000 (per IFIC the average MFDA account in 2014 was $44,000), in an equity mutual fund. The trailer on that would be 1% or $500, of which the salesperson might get half depending on his or her arrangement with the dealer. What kind of service is a client with a $50,000 account getting for $250? We've seen many situations where the level of service has ranged from a short meeting at RRSP season, abysmal to NIL. Recognize however we are talking very basic investment guidance like mutual fund selection, asset allocation and maybe some elementary tax suggestions. It is extremely rare to see a real financial plan in small accounts.

We expect that such small investors would be forced to utilize robos, bank branches (with proprietary mutual funds as the only choice), discount brokers (DIY) or financial priorities might shift to reducing household debt or paying down the mortgage. Clients with amounts to invest as low as $10,000 can access the markets via a direct-to-client firm like MFDA licensed dealer Steadyhand that offers its own proprietary high performance mutual funds, provides basic advice and does not pay trailers. The firm also offers fee reductions based on tenure and amount invested.

As account size grows investors can move up the advice depth ladder. They might also be seduced by a dual licensed Rep to purchase a Segregated fund and obtain the conflicted "advice" associated with that "insurance" product (Seg funds will continue to pay trailers , so "advice" of sorts will still be available to small investors after trailer prohibition in securities products).

There is an advice gap now because the advice provided is based on incorrect information. One has to question the "advice" being dispensed when the client risk profiling process rests on a foundation of Jell-O. The real advice gap is that core advice processes are not functioning. Assessing risk need, tolerance and capacity is fundamental before making investment recommendations ("advice"). Yet an independent research report by PlanPlus Current **practices for risk profiling in Canada** http://www.osc.gov.on.ca/documents/en/Investors/iap_20151112_risk-profiling-report.pdf found that while risk questionnaires are widely used in the mutual fund dealer channel, the vast majority (83.3%) of these questionnaires "are not fit for purpose." The report found that these surveys have too few questions, use poorly worded or confusing questions and involve arbitrary or poorly conceived scoring methodologies. More than half (55%) of risk questionnaires have no mechanism to identify highly risk-averse clients who should be invested solely in cash. The report identifies best practices in other jurisdictions and provides recommendations for regulators, the industry and the academic community. For example, it calls for a "clear regulatory framework that includes all aspects of risk in its definition." It recommends that regulators define the components of risk that they expect advisors to review with their clients in order to establish a client's risk profile.

- *Do you agree with our definition of an advice gap?*

If the "advice gap" is defined as the group of investors who cannot obtain the amount of [**investment**] advice they desire at the price they are willing to pay we would agree realizing however that in many cases a product-based proposition is masquerading as a trusted service- based proposition. The "advice gap" is no different than the "legal gap", or the "dental gap" in that there are individuals desiring specialized services who cannot afford them. That's life in a capitalistic society. Access to affordable investment advice, while desirable, is not a fundamental citizen right at this time.

The investment "advice" clients are receiving today from dealing representatives/ salespersons (self-identified as "advisors") is based on the low suitability standard in addition to being conflicted, thereby leading to non-optimum investor returns. Based on empirical data, a fair number of clients are receiving nothing more than a sales pitch with a recommendation to purchase, sell or borrow money to invest. As we see it, the kind of advice really needed for these small retail clients actually involves many actions that would result in using disposable cash to pay down high interest debt, secure adequate life and disability insurance, pay off the mortgage, budgeting better, spending less on frivolity, and setting up an emergency fund rather than investing in high fee products. Based on our experience, "Advisors" dependent on fundco trailers are unlikely to recommend such actions or take on such high maintenance /low margin accounts if trailers are banned (fee-only advisors would recommend actions beyond investing).

As far as tax advice goes, we do not see a big need for small accounts. Such accounts are pretty basic tax-wise. Besides , it is not clear to us that MFDA Approved persons have the qualifications necessary to provide accountable advice on tax matters .Today's widely-used interactive tax software provides more than adequate guidance on how to arrange tax affairs for small investors. Should a complex tax situation arise, we expect individuals would engage a professional accountant rather than an MFDA approved person.

Financial (other than investment advice) advice regarding debt counseling, income tax support, insurance and estate planning and will preparation would still be available from traditional sources at prevailing rates. For those requiring mortgage advice, mortgage brokers and bank branch staff can satisfy the needs. These important financial advice services will not be impacted by a ban on embedded commissions. So, where is the "advice gap"?

Notwithstanding our views and those of the CSA such an important issue deserves objective evidence .We therefore recommend that the provincial and territorial regulators, in cooperation with the MFDA/IIROC, retain an independent research firm to interview a representatively large number of investment fund investors to determine what level of service, if any, they get from their advisors in return for the trailers. This would include looking at the specific services the dealers provide their clients on an ongoing basis for the service fee/ trailer commission and relate those services to the dollar value of those charges. We expect there will be some services whose value may be difficult to quantify.

• *Should we differentiate between an advice gap for face-to -face advice and an advice gap generally?*

There is no doubt that some investors do feel more comfortable with face to face meetings. A differentiation is appropriate.

• *What types of advice or services currently provided today would be most affected by the proposal?*

• *Are there any potential interactions between this proposal, existing reforms such as CRM2 and other potential reforms such as CSA CP 33-404 that may affect the size of any potential advice gap?*

The existing advice gap would be reduced if embedded commissions and CSP 33-404 were implemented.

•How could a potential advice gap, face –to -face advice gap or financial service gap be mitigated?
• Do you think that online advice could mitigate an advice gap? If so, how?
We believe online advice will be attractive to many and will help close the postulated investment advice gap. For investors with less than $100,000, robo-advisors have already made the investment situation better. While investment solutions are still basic, low-cost diversification, coupled with automatic deposit, flexible reporting, and auto rebalancing provide an excellent starter kit for the small retail investor. Robos continue to expand their capabilities. For example WealthBar, regularly communicates through its website, emails and hosts webinar sessions to help further client confidence and build trust. They also use a wide range of investment classes to help reduce volatility for investors. Wealthsimple has full-time registered portfolio managers available for clients to talk to on the phone, over email or video chat. The company is also able to use its technology to identify and respond to investor concerns. If a nervous client is constantly logging into their account on a day when markets are tanking, Wealthsimple can contact them even if they haven't reached out to the company. Basic financial and tax planning tools are not far behind. Based on this we feel confident that small retail investors will be well served if trailers are banned.

Robo-advisors are fiduciaries so the quality of investment advice will actually be enhanced. Still, some segment of small investors want face to face interaction -it is here we believe the banks are best positioned to be able to provide investment "advice" at a competitive price. Bank-owned dealers have clients that line up to come see them at the bank branch. They have access to client's banking, mortgage, car loan and credit card information so they can operate on a high volume, low margin business model where they can keep their "advisors" on base salaries and some incentives. They have standardized advice and their costs are so far embedded and inter-twined that they don't have to show any "commissions". Bank salespersons have numerous opportunities for cross-selling, giving them a strategic competitive advantage over those firms with a more constrained service offering.

Discount broker capabilities are impressive but we remain concerned that recent IIROC proposals will reduce their benefits for the DIY investor if approved. We urge the CSA to challenge IIROC as its actions could adversely impact financial market health, decrease access, decrease competition and increase the postulated advice gap by unduly constraining discount broker capabilities.
• Do you think that the significant market share of deposit -taker owned and insurer -owned dealers in fund distribution in Canada will affect the size or likelihood of an advice gap to develop?
The Consultation Paper notes, that 55% of mass-market investors are already unadvised and those who purchase investment fund products tend to do so via integrated deposit-takers or insurers. We believe that the mass market dominance of deposit-taker (bank) and insurer-owned dealers will blunt the industry-postulated advice gap.

In a July 2016 column Vanguard Canada observed that its colleagues in the U.K. reported that the advisors who weathered the commission ban best were those who proactively decided to adjust their practices to thrive and not just survive. Many shifted to a fee-based compensation structure, as Vanguard has advocated in their advisor's alpha framework. “In Our own recent global survey of advisors found this view was shared by a majority, with 76% of Canadian advisors surveyed indicating a fee-based model was better for their clients than a commission-based model. *Is this the end of the line for trailer fees? “* https://vanguardcanada.ca/advisors/articles/research-commentary/vanguard-voices/is-this-the-end-of-the-line-for-trailer.htm The key assumption here is that regulators would take steps to ensure that fee-based accounts are suitable for clients (and that clients will have a choice as to the type of account).

18. *Given some of the changes we have seen in the industry over the past few years (fee reductions, introduction of DIY series, streamlining of fund series, automatic fee reductions increasing access to fee-based options etc.), what is the likelihood that the fund industry will transition away from embedded commissions without regulatory action? In particular:*
• *Will the industry continue to transition away from embedded commissions if the CSA does not move forward with the proposal?*
Some of the elaborate campaigns opposing a ban are well funded and comprehensive, comparable to a declaration of war. Given the defiant public stance of Advocis, IFIC, and others we think it is a pipedream that the MFDA channel will voluntarily transition away from embedded commissions. The infrastructure costs of such a change in business model may be prohibitive. Dual-licensed mutual fund Reps may in fact transition clients into trailer paying Segregated funds unless the CSA is able to develop an effective counter-measure.
We see these changes disproportionally affecting small-to-medium independent mutual fund dealers relative to full service *Investment Industry Regulatory Organization of Canada* (IIROC) member dealers as they rely more heavily on embedded commissions (27% of fee revenue compared to 16%).Representatives of vertically integrated deposit-takers and insurers appear to be already largely insulated from the short-term impacts of the proposed changes.

Although we see strong evidence of fund fee reductions, we do not feel there is a good chance that embedded commissions will gradually be reduced without regulatory intervention.
19. *How accurate is Figure 8 regarding the purchase options available to fund investors by channel, account size and firm type? In particular:*
• *Do you see payment options and business models evolving at present?*
• *How are they likely to change over time if the CSA were to choose not to move forward with the proposal?*
We do not have the capability to make such projections.

20. *We note that the distribution of fee-based series is still relatively limited in Canada versus other markets. Are there obstacles (structural, operational, regulatory, investor demand, etc.) specific to Canada limiting the use of fee-based series by dealers?*

From our limited sources we have seen a huge conversion to fee-based over the last two years in the IIROC channel. We have not yet seen a similar movement to fee-based in the MFDA channel. There may be structural/ system issues in the MFDA channel -that affects about 83,000 dealing representatives.

Potential impact on competition and market structure

21. *Please describe how discontinuing embedded commissions will affect competition and market structure and whether you agree with the analysis set out in Part 4? In particular:*
• Do you think the proposal will have an impact on the level of industry consolidation or integration? What about with respect to the concentration of mass-market investor assets held in investment products managed by deposit-taker owned firms?
We think the dominance of banks will increase.
• What are the likely impacts on investor outcomes and market efficiency of any potential consolidation?
• What opportunities and what challenges do you think the proposal would introduce for specific industry stakeholder groups?
• Independent dealers?
• Independent fund manufacturers?
The CSA provides one clue:" *For active investment fund managers with little or no access to related party distribution, on average 59% of assets at these firms may experience redemption pressure over time assuming once again these managers were not able to adjust their fees or improve performance*." We have no basis for agreeing or disagreeing with this statistic.
• Integrated financial service providers?
A wonderful growth opportunity.
• Mutual fund dealers?
We see huge challenges for MFDA dealers.
• IIROC dealers?
• Online/discount brokers?
• What is the likelihood and magnitude of regulatory arbitrage across similar financial products such as segregated funds and deposit-taker products?
Very hard to estimate but given the high percentage of dual-registered MFDA Reps, it would be naive to believe that the risk of arbitrage is anything less than significant.
• What would be the impact on dually-licensed mutual fund dealers and insurance agents?
Some will exploit regulatory arbitrage, others may exit the business.
• Will the proposal lead new, lower-cost entrants to the market? Why and how?
We do not see this happening. New mutual fund entrants would have to compete with the banks/ IG, outperform Fidelity and set up a distribution system for a relatively small market that faces increased regulation. Even powerhouse Vanguard entered Canada with ETF's rather than actively-managed mutual funds.

• Does the interaction between this proposal and the proposals set out in CSA CP 33-404 change your responses to the questions above and, if so, how?
• Will a transition away from embedded commissions reduce fund series and fee complexity, as we have contemplated?
Yes but it may give rise to a new fee structure related to the components of advice e.g. a fee for a financial plan, a fee for specialized reports, a fee for an IPS ….
• Do integrated financial service providers have an advantage in terms of their ability to cross-sell and cross-subsidize across business lines? If so, how?
Integrated financial service providers have a distinct competitive advantage in terms of their ability to cross-sell and cross-subsidize across business lines because they can offer convenient one stop shopping. Multiple accounts can be checked online and money transfers between accounts are simple with integrated firms. Although tied selling is prohibited, bundled cross-business pricing is not. Industry concentration will further increase in favour of the banks and insurance company –owned dealers and fundcos. Independent fundcos would be severely challenged without a dedicated distribution network. The introduction of performance fees might be one way the independent fundco might counter .Reduced competition is clearly not a positive in favour of a prohibition on embedded commissions.
• What are the potential effects on competition of the rise in online advice? Are these effects likely to be large and positive?
Online investment advice will be a positive. Over time, we believe many low cost services will be offered. Digital advice should drive human advisors to increase productivity, examine fees and sharpen their value proposition. The rise of AI could be a real game changer for the advice industry. *See Canada's financial services sector "moving fast" on AI* - Investment Executive
http://www.investmentexecutive.com/-/canada-s-financial-services-sector-moving-fast-on-ai

22. What impact will the proposal have on back office service processes at the investment fund manager or at the fund dealer? In particular:
• Is there any specific operational or technological impact that we should take into consideration?
We cannot comment except to note that mobile solutions are being demanded by younger investors and even some seniors.
23. The payment of embedded commissions requires the dealer and the investment fund manager to implement controls and oversight (with associated compliance costs) in order to mitigate the inherent conflicts of interest today.
• Would the transition to direct pay arrangements alleviate the need for some of these controls and oversight?

We are not aware of prevailing oversight or controls between the fund manager and distributors other than commission payment terms and conditions. If there really were effective controls, discount brokers would not be selling A class funds to online investors and collecting trailers for services not provided. Kenmar suggest that fund governance may also be a factor that should be reviewed as a possible reason for the high mutual fund fees in Canada. While other leading jurisdictions have a board of directors (and independent directors), Canada did not adopt that model and instead adopted the concept of the Independent Review Committee, which Kenmar does not believe provides sufficient oversight. We do not suggest that the CSA delay in implementing the recommendations herein while examining this issue, but it should be pursued.

• *To what extent, if any, does the use of direct pay arrangements by representatives today (e.g. when a representative provides services under a fee-based arrangement) alleviate the need for some of these controls and oversight?*

Under the lowly suitability standard, nearly anything is suitable. We fully expect all the usual well identified problems related to fee-based accounts – double dipping, aggressive asset increase initiatives, reverse churning, fee rates higher than 1% for small investors, abusive or no price breakpoints, leveraging etc. Tougher enforcement would help alleviate the abuse to an extent. A Best interests advice standard would also help alleviate the need for some of these controls and oversight.

24. *Embedded commissions, especially trailing commissions, provide a steady source of revenue for dealers and their representatives. If embedded commissions were discontinued, would dealers be able to compensate for the loss of this revenue with direct pay arrangements?*

We believe they would, say, via fee-based accounts with fees at 1 % or higher. Of course fee-based accounts can be and have been, abused, so regulators would need to be alert. The Cumming study found that an increase in trailer fees corresponds to a decrease in performance. There is negative drift in fund performance when other factors, such as trailers, influence fund sales. However, the study found a different story for mutual fund sales through fee-based purchase options. In these cases, fund sales are highly influenced by past performance and this has a positive impact on future performance suggesting that the greater transparency of fee-based accounts can potentially improve investor outcomes. We use the word "potentially" because we don't know if the fees in a fee-based account will be fair and reasonable or if it will be appropriate. If they exceed 1%, investors might be worse off.

One of the alternative payment methods is the fee-based account. In theory such an account might be an improvement over embedded commissions. In practice we have seen how the industry has exploited this account type in the double dipping scandals. Of course there are many other ways such accounts are harming investors. For example, clients nudged into such accounts might pay a 1% or more fee to hold cash, GIC's, index funds or Bond funds. This would be worse than the current level of exploitation. Another example we are seeing is that seniors (low portfolio turnover accounts) are inappropriately being nudged or forced into fee-based accounts simply to generate a steady flow of fees i.e. reverse churned .See our blogs on **Fee-based accounts** http://www.canadianfundwatch.com/2014/12/alert-trouble-with-fee-based-accounts.html and **Are you a Reverse churning victim?**

http://www.canadianfundwatch.com/2015/10/are-you-reverse-churning-victim.html Regulators need specific rules to address the many threats posed by-fee-based accounts.

As for direct pay, it would depend on the fee level and the method of payment. In principle, dealers should be able to compensate for the loss of trailers by charging a 1% annual fee (typical for equity mutual funds) or more. If it were all upfront, investor resistance would be high. Our concern is that dealers could charge more than 1% which might make the situation worse for small investors.

According to a JD Power study aimed simply to help U.S. wealth companies assess the relative attrition risk they face depending on how they change their products and pricing in response to the DOL rule the findings were illuminating: Responding to a question about their willingness to switch to fees, only 8% of commission-paying investors favour the switch, and another 33% say they probably will. Forty percent are leaning toward disagreement, while 19% are adamant in refusing. Among HNW investors, 25% said they would definitely not switch from commissions to paying 1% in fees on AUM; when the suggested fee rate rises to 2%, the objectors increase to 52%. As for commission-paying validators, 35% say they probably would not switch and 26% definitely would not. This could have implications for Canadian regulators but more research is needed***.***
Commission Clients Don't Favor Switch to Fees: *J.D. Power*
http://www.thinkadvisor.com/2017/03/16/commission-clients-dont-favor-switch-to-fees-jd-po Since the CSA is permitting commissions as direct pay, this should not be a huge issue in Canada. However, the up-front sales commission arrangement would need to be covered by a service/engagement agreement that requires the dealer to provide ongoing advice. Again, this advice should be under a Best interests standard not a suitability standard.

25. *Aside from commission grids and salaries, what other approaches to representative compensation might dealers use if we were to discontinue embedded commissions? How are these approaches likely to change over time?*

The Dec. 15, 2016 Canadian Securities Regulators NOTICE Review of Practices Firms Use to Compensate and Provide Incentives to their Representatives identified a host of compensation methods that are used by dealers to skew advice https://www.securities-administrators.ca/aboutcsa.aspx?id=1540 . The survey found that firms use a wide range of practices to compensate their representatives, including direct tools such as commissions, performance reviews and sales targets, as well as indirect tools such as promotions and valuation of representatives' books of business for various purposes (for example, retirement and awards). The systems are all based primarily on sales production.

We are surprised that a consultation paper on embedded commissions/conflicts-of-interest ignores an important aspect of the management expense ratio ("MER"). Fixed rate administration fees (include but are not limited to, registrar and transfer agency costs, audit fees, legal fees and custodial fees) can effectively prevent mutual fund expenses from declining as a percentage of assets as the fund grows We are of the view that such is a rather high price to pay for the "stability and predictability" such fees provide. *We believe such fees represent a serious conflict-of-interest for a mutual fund manager as there is a clear incentive on the manager to reduce service to unitholders in order to increase its profitability. The Fixed admin fee model also disconnects fee disclosure from actual cost incurred so subsidization (or not) can take place without detection or reporting by auditors.* We see no difference between these fees and management fees and view moves to adopt such fees as a backdoor attempt at increasing management fees.

See also our response to Q14.

26. *What impact will the proposal have on representatives in the industry? In particular, what impact will the proposal have on the:*
- *career path;*
- *attractiveness of the job;*
- *typical profile of individuals attracted to the career;*
- *recruitment; and*
- *relative attractiveness of careers in competing financial service business lines?*

We cannot respond to this question but can say that it is inevitable that proficiency and ethical standards must be raised and that could cause some Reps to depart the industry or retire early. Conversely, if the transition to a Best interests standard occurs, we could see many professional people attracted to the advice business.

27. How practicable are the mitigation measures discussed and how effective would these measures be at assuring:
- *access to advice for investors,*

We think the measures are adequate. As for the issue of low financial literacy potentially hindering investors' ability to assess the value of advisory services or to negotiate fair fees for such services, the CSA plan of continuing to work on investor literacy initiatives to increase investors' awareness of investing costs and empower them to confidently engage in the negotiation of fees with their representative will need to be dramatically beefed up. This would include more explicit examples of the effects of fee de-compounding, risks and benefits of working with dual licensed persons, how to assess dealer complaint responses and selected topics like reverse churning ,using videos, simulators, plain language brochures, even games. As noted previously, we do not anticipate small investors having the leverage to negotiate fees even if they possessed the requisite negotiating skills. Right now we are seeing small investors being shunned or minimum investment amounts being increased.
- *choice of payment arrangements for all investor segments, and*
- *a level playing field amongst competing investment products?*

We feel that the measures proposed will help mitigate the main effects of a trailer ban between competing investment products.

We would not expect that POS and CRM2 reforms will dramatically improve investors' awareness and understanding of fund and dealer compensation costs in the lead up to any potential rule proposal discontinuing embedded commissions. After all, Fund Facts does not delineate the actual trailer rate (only a range is provided) and annual CRM2 reporting omits about half the cost of investing (only dealer costs are included) with product costs excluded. We would not expect this quasi disclosure to sufficiently improve investor awareness and understanding that would provide a retail investor with an initial point of reference from which to gauge the appropriateness of advisory fees under direct pay arrangements.

The proclamation: "*We would expect representatives to fully inform their clients of the types of accounts available, and the differences between those accounts, both in terms of service and cost. Our expectation is that investors would have more choice in how they may pay for advisory services further to the discontinuation of embedded commissions, not less* "should be validated.

The first sentence is rather naïve given that dealers who offer fee-based do not distinguish fee rate based on service. The only distinction is level of assets. Again, dealers are free to say we offer our services for X% and if you don't want all the services, you are still paying X% if you wish to deal with us. After all, the dealer is not obligated to take on any business; no one has a right to force the business to offer its product or service on a basis that it chooses not to. This is the essence of capitalism. In fact it is happening now to clients who are moved into fee- based accounts (or asked to move their account elsewhere).

Based on history we would have zero confidence that the CCIR will take steps to neutralize regulatory arbitrage. The power of the insurance lobby is well known. The CSA plan to continue to liaise with other regulators to discuss the risk of dealers and representatives prioritizing their compensation interests over the interests of their clients by inappropriately shifting their clients' assets to other investment products with embedded fees is inadequate investor protection. We suggest that Seg funds in particular be defined as a security and that creative rules that would help mitigate arbitrage be introduced by the CSA/IIROC/MFDA.

If the definition of advice is advice on investments (as opposed to financial advice) we feel the number of available options should be adequate. This is hard to predict precisely but we feel that the risks are low that access will be denied to those truly seeking trustworthy investment advice and willing to pay a fair price. See our WHITE Paper **Small investors will not be disenfranchised by a prohibition on trailers**
https://drive.google.com/open?id=0ByxIhlsExjE3Rk05VHBpd285VFk

We remind the CSA that the "advice" provided today is conflicted, not achieving regulatory objectives and in many cases causing investor harm. The CSA Consultation Paper on Best Interests http://www.osc.gov.on.ca/en/SecuritiesLaw_csa_20160428_33-404_proposals-enhance-obligations-advisers-dealers-representatives.htm stated ***"Clients are not getting outcomes that the regulatory system is designed to give them:*** *There are a number of potential causes of this concern, including opaqueness in the* *suitability assessment, existing requirements that require more clarity to assist in effective enforcement, barriers to obtaining redress for a registrant breach, and lack of effective compliance and enforcement in certain cases."* Also *"The self-regulatory and industry organization investor complaint experience shows there is consistent and ongoing non-compliance with many of the current key regulatory requirements, with the unsuitability of investment recommendations being the primary basis for complaints to OBSI for the past five years, case assessment files for IIROC for the past three years and allegations in MFDA enforcement cases for the past three years". Source:* http://www.osc.gov.on.ca/en/SecuritiesLaw_csa_20160428_33-404_proposals-enhance-obligations-advisers-dealers-representatives.htm Our comments on CP 33-404 can be found at http://www.osc.gov.on.ca/documents/en/Securities-Category3-Comments/com_20160711_33-404_kenmar.pdf and are incorporated herein by reference.

We believe financial advisors should be clear with their clients about what services are provided and we believe CRM2, which require annual disclosure of the amount of trailing commissions received, in dollars, could at least in principle ,provide the means for the retail investor to evaluate whether they are getting appropriate value for the services. Kenmar believe that with a clear delineation of services, the competitive market should then address this effectively. We base this view on our belief that there are some advisors who offer many services to their clients and many advisors who offer very little.

For clients of the latter type of advisor, they can review the annual compensation report and, if they do not believe they are getting value for service, they should switch dealers/advisors. Virtually anyone who has ever transferred an account from one dealer to another is aggravated as to why the process takes so long. We would argue that it takes so long because there are no enforced regulatory requirements around maximum timeliness and basic corporate behaviour is such that a dealer is slow to transfer out client money since that directly impacts firm revenue. **To facilitate this, the MFDA, IIROC and the CSA should consider regulations regarding account transfers including maximum transfer times as integral to this consultation**.

28*. What other measures should the CSA consider to mitigate the above unintended consequences?*
We have provided numerous recommendations throughout this document to help mitigate unintended consequences. The CSA should learn from the experiences of jurisdictions that have banned commissions.
29. *Other than the potential impacts we have identified in Part 4, what other potential unintended consequences, including operational impacts and tax consequences, may arise for fund industry stakeholders and investors further to the discontinuation of embedded commissions? In particular:*
• Would there be a negative tax impact to investors associated with their payment of dealer compensation under direct pay arrangements? In particular, would the investor's

payment of dealer compensation through periodic fund redemptions facilitated by the investment fund manager attract tax consequences? Please explain.
In a non-registered account, such redemption could have adverse tax consequences and create a record keeping nightmare for investors.
• *To the extent a transition to direct pay arrangements results in the rationalization of fund series, could this rationalization attract negative tax consequences for investors?*
• *What, if any, measures, regulatory or otherwise, could assist in mitigating potential operational and tax impacts?*

We are unable to provide useful input in response to this question.

30. *With respect to the loss of a form of cross-subsidy from high net worth investors to lower-wealth investors in a fund further to a transition to direct pay arrangements,*
• *to what extent (please quantify where possible) would the loss of this cross-subsidy increase the cost of providing advice and services to lower-wealth fund investors under direct pay arrangements?;*
We leave this to industry participants for response.
• *does the existence of this form of cross-subsidy suggest that high net worth fund investors may be indirectly paying fees that are not aligned with the services they are receiving (i.e. do the fees they pay exceed the actual cost of the services and advice they receive?); and*
• *what measures may mitigate the potential effects on dealers, representatives and investors from the loss of the cross-subsidy?*

Based on previously submitted industry Comment letters, cross-subsidization allows dealers to service smaller accounts .Large investors are the source of funds that permit this to occur. If actual cost was charged, the price for advice might be too high for small investors unless the dealer decided it a sound business decision to subsidize small accounts until they grew to an economic size.

[Another form of cross-subsidization can occur across fund families .In *Favoritism in Mutual Fund Families? Evidence on Strategic Cross-Fund Subsidization* by Jose-Miguel Gaspar, Massimo Massa, Pedro P. Matos https://papers.ssrn.com/sol3/papers.cfm?abstract_id=557078 the researchers investigated whether mutual fund families strategically allocate performance across their member funds favoring those more likely to generate higher fee income or future inflows. The researchers found evidence of strategic cross-fund subsidization of 'high family value' funds (i.e. high fees or high past performers) at the expense of 'low value' funds in the order of 6 to 28 basis points of extra net-of-style performance per month, depending on the criteria. This overperformance is above the one that would exist between similar funds not part of the same fund family. The authors further document how this family strategy takes place by looking at preferential allocation of IPO deals and at the amount of opposite trades among 'high' and 'low value' funds belonging to the same fund complex (a practice that can encompass 'cross-trading'). Such subsidization practices are clearly more available to integrated firms like the deposit-taking firms (banks).]

Under certain fee structures used in Canada, all investors in a particular mutual fund (or series) pay the same management fee. However, the proportion of that fee paid out as a trailing commission may differ depending on the type of sales charge paid by each investor at the initiation of their investment (higher trailing commissions are generally paid for funds (or series) sold on a front-end basis). Thus, two investors buying the same mutual fund may face different upfront charges and different proportions of the management expense fees may be paid out in commissions to their advisors. As a result, investors with lower trailing commission ratios subsidize those with higher commission ratios through the management expense fee. This diversion of resources causes affluent (HNW) clients to pay more than they should. We would be glad to see this unfair practice end as it has no place in a contemporary advice-based system.

In our view, mitigation measures could include

- The subsidization of smaller accounts by larger ones could also be addressed through firms creating a fee schedule that entails some subsidization of smaller accounts. By taking a long term view of the relationship, and a long term business plan approach, smaller investors can continue to be served profitably under a fee-based model. Firms will benefit over time as such clients grow their assets.
- Independent fundcos may need to acquire a distribution channel to mitigate the loss of the subsidy (or abandon the market).
- Transitioning product line to actively-managed ETF's. Canada already has the highest percentage of actively- managed ETFs in the G7, with this type of fund representing 13.7 % of total ETF assets, compared with just 1 % in the U.S. market, as of Dec. 31, 2015 according to data compiled by National Bank Financial https://beta.theglobeandmail.com/globe-investor/funds-and-etfs/etfs/active-etfs-finding-fertile-ground-in-canada/article28495210/?ref=http://www.theglobeandmail.com& Per CETFA, the amount would be approximately $22.7 billion vs aggregate industry AUM of $123 billion or 18% as of end of Q1, 2017.
- Superior fund performance /effective marketing to attract clients.
- Investors should be offered lower MER fund series as would be reflected in attractive fund breakpoints and household rate packages.
- Investors could be offered loyalty discounts based on the number of years invested with the fund family
- Confident portfolio managers might be willing to implement performance fees as a means to increase revenue to offset the loss of the cross-subsidy provided to smaller investors.
- MFDA dealers could start selling ETF's in order to broaden their market coverage.

A positive by-product of a prohibition would be that the value (or not) of active management of a fund could be compared to a benchmark without the constant need to account for the embedded commission.

31. What measures could fund industry participants proactively take to mitigate the unintended consequences that may stem from the discontinuation of embedded commissions?

We have no comment except to note that a different corporate culture is required from the leadership. They should be taking steps now to address the known consequences of a changing consumer base, fintech and regulatory environment.

32. *For each transition option, please tell us how your business (investment fund manager or dealer) would have to operationally change or restructure in terms of systems and processes and the related cost implications. Where possible, please provide data on the estimated costs.*

We have no comment except to make the observation that it is the primary obligation of regulators to protect investors, not encapsulate costly and abusive business models.

- Are there unique costs or challenges to specific businesses?
- What transition period would be appropriate?
- Should existing redemption schedules for DSC and low-load purchase options be maintained until the redemption schedule is completed, or discontinued at the Transition Date?

We believe they are part of a "deal' and so should be allowed to play out. It would be a constructive gesture if the industry voluntarily waived some early redemption penalties say for hardship cases or when evidence of mis-selling becomes apparent.

NOTE: On page 47 of the consultation we're told "Fund investors with little to invest are the most likely to be offered DSC purchase options and some firms primarily offer their clients DSC options. Also "The dealer will typically choose which purchase options to make available and if multiple options are made available, the representative will choose which of these options are presented to the client depending on their needs and the representative's revenue requirements." **It seems to us such undifferentiated "advice" is likely mis-selling, calling out for regulatory enforcement.**

33. *Which transition option would you prefer? Why? Are there alternative transition options that we should consider?*

As investor advocates we prefer the transition with the shortest cycle time. The CSA say they understand that it will be imperative to provide sufficient time to all affected parties to ensure a successful transition. The CSA believe that a Transition Date of 36 months after the Effective Date could provide sufficient time to complete all required transition steps. If that happens, it will be 2021, 26 years after the first of the Stromberg reports on investor protection! Kenmar appreciate the disruption that a ban on embedded commissions will have but expect that at least some progressive industry participants will move faster and be rewarded by increased sales.

34. *As discussed in Appendix B, the CSA did not retain the option of capping embedded commissions, either as a stand-alone solution to the key issues discussed in Part 2 or as an interim step toward an eventual discontinuation of embedded commissions. Should the CSA further consider using a fee cap as a transition measure? Why?*

The industry argument is that capping commissions eliminates one of the main conflicts in the Cumming report - increased trails resulted in increased sales to that fund company with less correlation to performance. The other big conflict was that the sale of proprietary products bears no relationship to performance of those products - but the paper does not deal with that in any way - in fact it sends the modest investor to the banks. Several fundcos posit that a fee cap allows the small investor to purchase the fund at a stated price without having to explicitly pay for the "advice "- advice they may perceive that they can't afford. The affordability of course comes about by subsidizing the real costs by overcharging larger fund investors. Per the CSA, Investment fund managers could facilitate investors direct payment of dealer compensation through payments taken from the investor's investment (for example deductions from purchase amount or periodic redemptions from the investors account).

In Jan.2016, Credential Credit Union announced a fee -based payment system for mutual fund investors. According to the News Release "The OnPoint Fee-Based Account solution is best suited to investors with a minimum of $100,000 to invest who are seeking to build a strong relationship with an advisor who can provide personalized advice and long-term investment solutions. " http://www.credential.com/about-us/news/press-releases/2016/01/26/credential-financial-introduces-mfda-fee-based-account-for-credit-union-members We expect such a payment system will be expanded with lower minimum thresh-holds.

We argue that the idea of small investors negotiating fees is wishful thinking. The CSA want to prompt an explicit negotiation, but we don't think most small retail investors are equipped to negotiate because a lack of negotiating leverage, poor negotiating skills or information asymmetry. However, as investable assets increase, lower rates should apply in a competitive market.

Capping fees would not eliminate the potential for conflict created by the fund manager paying the client's agent, but it would, according to industry participants, address the financial incentive to behave badly and, in their view, largely reduce the harm created by the conflict. It is also asserted that trailers are fairly consistent within classes, so in a sense this would regularize what is already happening in practice and would eliminate the outliers in the MFDA channel. An embedded commission rate cap is of minimal value in the IIROC channel because of the large number of competing non-fund securities and SMA's available to such dealers/Reps.

The CSA's main objection seems to be that capping commissions wouldn't eliminate embedded commissions/ conflicts. But using a fee- based account also doesn't eliminate all conflicts either so there is little or no net gain by banning trailers unless a statutory Best interest advice standard is adopted.

On the other hand, investor advocates argue that maintaining trailers (even at a 1% cap) does absolutely nothing to get advisors to look at product merit as the primary determinant of what they recommend to clients. Industry participants seem to think that the only options advisors have for clients are actively-managed mutual funds .As a general rule, ETFs (and Index funds) outperform active MFs over the long term, but by "advisor" recommendation, far more money goes to MFs… simply because of the bias-inducing trailers that they pay. See **Why Indexing Works** by J.B. Heaton, Nick Polson, Jan Hendrik Witte: SSRN
https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2673262

On balance, we thought the CSA arguments against a fee cap were reasonably sound so cannot think of a reason to reconsider If the CSA vision is to isolate the costs of advice, the connection between fund manufacturers and dealers/advisors must be severed but in a way that will not harm investors.

35. Please explain whether you think each of the initiatives discussed above will, either alone or in combination:
• address the three investor protection and market efficiency issues and their sub-issues identified in Part 2; and
• address or not address any additional harms or issues that you have identified.

As we have explained, the prohibition of embedded commissions is complementary to the other CSA initiatives -- targeted reforms and regulatory Best interests. If these other reforms are not implemented, we believe the investor protection gains will be marginal and could significantly increase the market share of bank-owned dealers with proprietary products, which we regard as negative. If the other initiatives are introduced, then we believe the identified issues will be addressed.

When embedded trailers are banned, fund dealers will likely respond by going fee-based like the investment dealers, consolidate or disappear as control of remuneration passes from the fund companies to the dealer's hands.

What the Cumming's report does not emphasize was that dealer compensation on mutual funds is largely uniform (A 2015 report by Investor Economics found that 86 % of equity and balanced funds sold in Canada paid trailer commissions of 1 % for front-end and no load options. An additional 9 % of the funds paid fees above 1%). At dealers, fee schedules may be opaquely disclosed and may be complicated for retail investors to compare. Regulators will not be able to regulate dealer/advisor fee schedules. The CSA assumption seems to be that a competitive market will prevail. Perhaps it will. Will small retail investors really be able to negotiate fees? We doubt it, so they will be nudged into robos, bank branches, DIY investing or simple index investing like that offered by Tangerine. Not necessarily bad outcomes while they wait until their account size grows to the point where more fulsome advice can be obtained.

36. Are there alternative options or measures, whether regulatory or market-led, that could successfully address the three investor protection and market efficiency issues and their sub-issues identified in Part 2. If so, please explain.

The principle of separating advice from transactions is so fundamental that any other identified option is not consistent with that goal. That being said, we would listen to industry proposals.

Summation

In aggregate, the CSA estimate that 44% of actively-managed fund assets may experience redemption and reallocation pressure to competitor investment fund managers over time if embedded commissions were discontinued and these managers were unwilling or unable to adjust their fees or improve performance .For active investment fund managers with little or no access to related party distribution , on average 59% of assets at these firms may experience redemption pressure over time assuming once again these managers were not able to adjust their fees or improve performance. Assuming the CSA analysis is accurate, what does this say about the prevailing Canadian mutual fund industry and its distribution network.

Freeing the "advisor" from trailer commission constraints could be a potential Win-Win for retail investors and those who advise them. Of course there is still the risk of unsuitable investment recommendations, undue leveraging, churning, personal financial dealing, inappropriate pension commutation under foggy suitability criteria and even risky/ fraudulent Off - book transactions. Robust compliance and regulatory enforcement is key to protecting retail investors.

While we accept as fact that trailer commissions skew “advisor” recommendations and reduce fund performance, Kenmar believe many other factors are at play .We support a discontinuance of embedded commissions as a complement to the CP 33-404 regulatory reforms. [See APPENDIX I for a Summary for possible failure mechanisms related to a discontinuance of embedded commissions. See APPENDIX II for a listing of issues related to the prohibition of trailers/embedded commissions. See APPENDIX III for Referenced Documents used in the preparation of this submission.]

We hope this Comment letter proves useful to the CSA in its policy setting deliberations.

Trusted advice is a Canadian socio- economic issue well beyond the bounds of securities regulation. We had better be careful we don't squander this opportunity to protect trusting financial consumers.There will be a huge social and economic cost if we do.

We thank the CSA for the opportunity to provide these comments. We would be happy to address any questions you may have or to meet with you to discuss these and related issues in greater detail. We appreciate the time you are taking to consider our points of view. Do not hesitate to contact us if there are any questions regarding our Comment letter.

Permission is granted for public posting.

Sincerely,

Ken Kivenko P.Eng.
President, Kenmar Associates

APPENDIX I: Possible Failure mechanisms resulting from prohibition of trailers

We focus on three of the CSA's main concerns about conflicts of interest: that embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors; that they limit investor awareness, understanding, and control of dealer compensation costs; and that "[e]embedded commissions paid generally do not align with the services provided to investors."

Sounds pretty enticing. Our intuition was always to support prohibition. Yet as fact-based commenters we explored various scenarios to see if banning embedded commissions alone will deal with the stated concerns AND not give rise to unintended failure mechanisms.

Based on our analysis the following failure mechanisms will exist:

1. Dual licensed reps will flog Seg funds and other "investment" products not under the domain of the CSA. The life insurance industry which regulates Seg funds is lightly regulated compared to the CSA regime and Seg fund fees are higher than mutual funds. If not addressed, such regulatory arbitrage could cause harm to retail investors.

2. Integrated firms like the banks will continue to offer only proprietary products. Investors at bank branches will thus be receiving "advice" that is not only conflicted but sub- optimal. This is consistent with the findings of the Cumming report. Even that report did not consider that banks , just like insurers , also have " investment " products like PPN's and Index linked GIC's that could substitute for mutual funds . Such products are not considered to be low- cost products and contain provisions that limit the upside potential of the investment. The CSA has no mandate to regulate the sale of such products so mis-selling could increase.

3. Independent fundcos without a dedicated distribution channel could be disadvantaged by prohibition relative to the integrated firms with an internal distribution network. The end result could be reduced competition for the banks. It could be argued that the increased bank market share will ultimately work to the detriment of the retail investor.

4. Trailing commissions from the fund manufacturers will be replaced by dealer fees (incentives, inducements and non-financial rewards). These fees could very well be higher than the traditional 1% trailer on mutfunds. The Dec 15, 2016 CSA/IIROC/MFDA announcements listed a host of conflicts-of-interest that made our eyes glaze over. This revelation actually is an admission of massive regulatory failure *re enforcement of the basic requirement for registrants to act fairly, honestly and in good faith*.

If embedded commissions are banned they will simply be replaced by these advice-skewing incentives unless they are specifically banned and the rules (a new, more comprehensive version of NI81-105) vigorously enforced. Sales targets cannot co-exist with trust-based advisory relationships...they override the equations that frame the integrity of the deliverable service- trustworthy advice.
We urge the CSA act promptly to address these investor abusing conflicts-of-interest.

5. Conversion of clients to fee- based accounts is in motion now by IIROC dealers. The fees will apply to cash, bonds, bond funds, GIC's, mutual funds etc. so that it is quite possible, even likely, that overall client investing costs will rise. Such fees would not be regulated and could exceed the nominal fund industry standard of 1% for actively-managed equity funds. This could be compensated for if dealing Reps select lower cost products, but will they in the absence of a Best interests standard?

6. Reverse churning could occur (is currently occurring) that could see Buy and hold investors unduly paying more in fees. Regulatory enforcement will be even more critical as many more Canadians, especially seniors, will hold fee-based accounts. Will regulators step up to the plate?

7. The continuance of referral fees could subtract from any potential prohibition gains. Similarly, the continued use of cooperative marketing (using fund assets) could undermine the ban by continuing to allow fundcos to influence dealers. A recent OSC settlement with Sentry Securities Inc. followed a multi-year investigation into sales practices at the Toronto-based independent mutual fund company. OSC commissioner Philip Anisman, who approved the settlement, said this was the first proceeding by the OSC that addressed "prohibited payments and gifts" made by an investment fund manager and the "systemic supervisory failures" that permitted them.(the rule regarding prohibited payments came into effect in 1998 so enforcement has been rather shallow over the past 18+ years). Investment fund managers ("IFMs") are prohibited from making a payment of money or providing a non-monetary benefit to a dealing representative ("DR") in connection with the distribution of securities, except in certain permitted circumstances under Parts 3 and 5 of National Instrument 81-105 Mutual Fund Sales Practices ("NI 81-105"). All payments made to Reps from fundcos should be prohibited as they just add to problems with no benefit for clients.
http://www.osc.gov.on.ca/en/Proceedings_enr_20170405_sentry.htm

8. Small investors who desire human facing advice may be confined to bank branches (and proprietary products/funds) assuming banks develop a new fee structure. The reason the system hobbles along now is that larger investors are subsidizing smaller investors. The result is that dealers use the subsidy to deal with smaller investors. Of course it has been proven by research that the “advice” provided under the trailer regime results in conflicts- of- interest that harm investors. In some cases the "advice” can be doubly dangerous because of churning and leveraging. Regulators and investor advocates have questioned the level of advice relative to fees paid, the quality of advice provided or even if advice is provided at all. Whether small investors receive much trusted support other than fund selection. / asset allocation recommendations is an open question. More information is needed on exactly what “advice” dealing reps provide to small accounts.

9. Smaller clients may be unable or unwilling to pay directly for conflicted advice. Some may decide to become do- it- yourself investors or use robo -advisors or invest with reputable direct to client fund companies that offer guidance but not recommendations. The decision not to engage an advisor could be based on unaffordability, anger at being told in the past that advice was free or simply not feeling the advice is worth the cost. According to industry lobbyist IFIC, just 37% of mutual fund investors seek direct payment for advice. Kenmar believe a combination of convenience/simplicity, complacency, detachment, a lack of understanding of the impact of conflict-of-interest on recommendations and unbridled trust in their advisor contribute to this attitude.

10. Industry participants argue that even small accounts need personalized investment advice while some investor advocates argue that such small investors could buy a low-cost balanced fund or ETF or just pay down debt or their mortgage. Will these postulated small account advice orphans materially suffer as a result of prohibition? We believe not but it is still a risk that should be assessed.

11. Account and product cost are not currently explicit components of a “suitability” assessment. Given that fees reduce returns to investors, and numerous studies have demonstrated the negative relationship between fees and returns. Fees are an important consideration in evaluating the suitability of otherwise-similar investment funds or other investments. Cost was an element of the targeted reforms but it is far from clear that the CSA will make cost an explicit component of suitability. If it does not, investor protection will remain compromised.

12. Since the consultation is non-committal on the future of Best interests and the targeted reforms, the prevailing low suitability standard will continue, leaving a gaping hole for bad advice to continue to be dispensed with near impunity.

13. Continued lax enforcement, wrist slap penalties and a focus on individuals rather than root causes (like supervision, compliance and compensation practices) could undermine the prohibition initiative. Unless regulators apply timely and effective deterrence, rules are meaningless. The recent scandals involving double dipping

occurring over a decade is an example of massive dealer compliance and regulatory failures. Another example would be the lack of NI81-105 enforcement. Yet another would be discount brokers improperly collecting advisory fees.

An objective assessment of the cumulative impact of these failure mechanisms leads to the conclusion that the anticipated benefits of embedded commission prohibition will be less than hoped for. In the worst case, it could make the situation even worse for retail investors.

APPENDIX II: Related Issues not covered by the Questions

There are other issues we wish to draw the CSA's attention to. These include but are not limited to:

A. After embedded fees are banned, will investor's pay for investment advice?
Given the scope, nature and quality of the "advice" actually being provided, the question is -will retail investors of modest means be willing to pay for such advice when the true dealer costs are made visible via CRM2 and other means and embedded commissions banned ?

There is a range of possibilities why they would continue to pay for personalized investment advice even under the suitability standard:

- They are happy with the results obtained
- They are too busy to spend time on investing matters
- They lack confidence in their own investing abilities
- They do not have access to friends or family that are willing and able to assist them
- They feel their representative adds net value after fees
- They trust their representative even though they may not trust the financial services industry generally
- They appreciate and value advice beyond investing such as on tax matters , better saving habits , comfort during market extremes
- They are not aware of the inherent conflicts of interest and/ or how that may adversely be impacting their portfolio performance
- They believe conflicted advice is better than no advice
- They are unable to determine if the fees/ costs are unreasonable/ competitive
- They underestimate the de-compounding effect of fees on long term returns and hence are fee -insensitive

It is also quite possible they would not pay for personalized investment advice once the masking effects of embedded sales commissions are banned:

- They will discover that mutual funds are a very expensive product that does not provide superior returns over longer timelines

- They will decide the fees are too expensive or they can't afford to pay
- On tax matters. they will leverage their tax preparer (or software)
- On insurance matters, they will use an insurance broker
- They will , on principle, refuse to pay because they had previously been told advice is free
- They will discover the de-compounding impact of fees on long term performance
- They will self-educate via courses , books, investment newsletters
- They will conclude they don't need or want personalized advice
- They will be upset that they have been exploited and/or may hear about well-publicized cases of investor abuse by dealers/advisors (like the double dipping cases)
- They will conclude that they should divert cash towards paying down high interest debt instead of paying fees for investing advice
- They will discover that DIY isn't as intimidating as they thought
- They will discover other lower cost options such robo- investing, debt counsellors, investment clubs or financial coaches
- They will revert to being GIC investors and buy GIC's , Govt. Bonds , PPN's and Index linked GIC's or even Segregated funds
- They will invest in some creative version of a Life Cycle Fund

In the United Kingdom, studies seeking to understand financial consumers' decision-making behaviour conclude that they are most reluctant to pay upfront for advice [June 2006; Andrew Clare, "The Guidance Gap" (Cass Business School, January 2013) http://www.cassknowledge.com/sites/default/files/article-attachments/the-guidance-gap.pdf]

A 2010 study involving retail investors from eight European countries found that between 20 to 30 per cent of respondents were unwilling to pay upfront for advice *Consumer Decision-Making in Retail Investment Services: A Behavioural Economics Perspective* http://ec.europa.eu/consumers/financial_services/reference_studies_documents/docs/consumer_decision-making_in_retail_investment_services_-_final_report_en.pdf .
Like Canada, it is quite possible they did not realize they were always paying for "advice" via hidden fees.

In 2013, the **CFA Institute & Edelman Investor Trust Study** polled investors across the US, UK, Hong Kong, Canada and Australia. The study was based on the feedback received by 1,604 retail and 500 institutional investors. When asked what was most important when making a decision to hire an investment manager, investors ranked "trusted to act in my best interest" as most important (35%). Another 17% stated that commitment to ethical conduct mattered most to them. If you combine these two factors of trust and ethics, you will see that it is the most important thing to more than half of the respondents. The ability to achieve high returns was most important to just 17%, while, surprisingly, the least rated was the amount/structure of fees (7%). http://www.morningstar.in/posts/28966/are-investors-willing-to-pay-for-financial-advice.aspx This suggests to us that while some investors might be unwilling to pay for conflicted advice they would certainly be open to paying for professional advice they could trust.

Even amid today's strong markets, investors are happy to pay for expert advice on their investments. Those were the findings from a recent study performed between January and September 2016 by Cerulli Associates, a Boston-based research and consulting firm. Half of the approximately 5,500 participants agreed with the statement, "I am willing to pay for advice regarding my financial investments." Fully, 79 percent of households aged 30 to 39 either agreed or strongly agreed with the statement, "I am willing to pay for advice." Additionally, 73 percent of households under age 30 felt the same way. While this study applies to U.S. investors, we can find no reasons not to expect similar results in Canada.

Research by behavioural economist Dan Ariely on the "pain of paying" suggests that certain methods of payment will be more successful than others in getting the retail investor to pay directly for advice. Pain is never a good motivator to encourage consumption of a desired product or service. See *The Pain of Paying* http://danariely.com/2013/02/05/the-pain-of-paying/ and also *What is the Pain of Paying?* https://www.ezonomics.com/whatis/the_pain_of_paying/ There could be initial resistance to paying for advice especially since it was previously understood to be free.

Industry lobbyist IFIC sponsored Pollara research found that just over half (54%) would prefer to compensate their advisor through tied-advice (bundled) fees, while 37% would prefer to pay a direct fee. https://www.ific.ca/wp-content/uploads/2016/09/IFIC-Pollara-Investor-Survey-September-2016.pdf/15057/ It is quite possible that when these mutual fund investors become aware of the true cost ,nature , robustness (or not) of the advice provided, the numbers would change significantly. It remains to be seen if CRM2 reporting will have a significant change in investor decision making.

We would expect a certain segment of Canadian investors, also might resist paying upfront fees for financial advice because they do not understand what working with a financial advisor entails and they are unable to discern the benefits, which can be intangible, delayed in time and with an uncertain outcome. They may however be willing to pay for advice if it can be demonstrated that (a) total costs will be equal or lower than prior costs (b) that billing could be spread over a year as was the case with embedded commissions and (c) the integrity of the advice can be relied upon.

The CSA will need to invest in a comprehensive public information campaign to explain the changes in order to stimulate consideration of direct pay advice (or not). Associated Govt. policy alternatives may include optional CPP, a free basic Govt. advice service (as in the UK), a tax deduction for advice fees and investor education courses/books.

B .DIY investor abuse by discount brokers
Discount brokers shouldn't be collecting trailer commissions intended to provide advice.If

we examine tables 13 and 15 of the CSA consultation document we find that only $12 Billion of the $30 billion in mutual funds are D class which means that $18 billion is invested in trailer commission paying funds. Since discount brokers cannot and do not provide investment advice, clients are being robbed of returns. Clients are not being treated fairly, honestly and in good faith as required by securities laws. We've been asking Regulators for years to enforce the law; we're still waiting for an answer. At 1% trailing commission that amounts to $180,000,000 each year that isn't going towards the nest eggs of Canadians! **The IIROC/CSA should take immediate steps to eliminate this massive violation of the requirement to deal fairly, honestly and in good faith with clients and the IIROC's claim that its rules equate to a Best interests standard.** There is no need to wait for a decision on embedded commissions.

[The consultation paper discusses this issue in a roundabout way and, to our surprise, seems to say that regulators may not have ability to tell discount brokers firms to stop collecting trailer commissions. (see Appendix B iii Require a standard class for DIY investors with no or reduced trailing commission). It says the CSA understand that "any nominal trailing commission paid would cover the costs of administrative, compliance and technological services provided by the dealer or manufacturer"." It may not be feasible or possible for the CSA to compel investment fund managers to create a new "execution only" series and/or compel dealers to distribute this type of series".] That is not the real issue. We are not talking about such a series (D?) **– we are asking that IIROC enforce the law (and it's own rules) requiring its members including discount brokers to act fairly, honestly and in good faith with clients and to provide the advice said to be provided per the Fund Facts disclosure given to clients in advance of purchase. We are also asking the CSA to examine fund governance – why is the fund making payments from investor assets to dealers to provide advice services they know will definitely not be provided?**

C. A defective KYC leads to inappropriate advice to investors
The Small Investor Protection Association www.sipa.ca has issued a Report *The Know Your Client Process Needs an Overhaul* http://sipa.ca/library/SIPAsubmissions/500%20SIPA%20REPORT%20-%20KYC%20Process%20Needs%20Overhaul%20-%20201607.pdf which provides constructive suggestions for improvement. We strongly encourage the CSA to review this report and unpublished IIROC research and take the necessary corrective actions.The discretion, the complexity of the processes and the asymmetry of knowledge and experience place the dealing representative and the firm in a position of great responsibility and the elderly investor in a vulnerable position. KYC information should formally be updated at least once per year. Unless the core KYC process is improved, merely changing the method of payment will not in itself lead to improved investor protection or better investor outcomes. The basic foundations for robust advice giving must be in place.

We further remind the CSA of the OSC Investor Advisory Panel sponsored award-winning paper on risk profiling by PlanPlus. The paper https://www.osc.gov.on.ca/documents/en/Investors/iap_20151112_risk-profiling-report.pdf The IAP's research found that most (83%) risk-profiling questionnaires are not "fit for purpose" and that many of these tools use arbitrary weightings, have poorly worded questions and aren't capable of identifying risk-averse investors. Despite these flaws, these tools are widely used in the investment industry. Almost half of the firms reported that risk questionnaires were developed in-house and another 36% said that advisors could choose their own risk profiling methodology. Only 11% of firms could confirm that their questionnaires were 'validated' in some way. What this means is that the "advice" being provided today is based on a very shaky foundation .So again, simply banning trailers will not lead to better advice. Key supporting advisory processes must be repaired or overhauled in parallel.

D. Make dealers accountable for the actions of their representatives

It's well known that regulators collect only a tiny fraction of the fines imposed on dealer Reps. whom they hold responsible for investor abuse. We therefore argue that the deterrence value is NIL. We further argue that the advisory contract is with the dealer NOT the individual Rep. Imagine if aircraft manufacturer Boeing practiced this way. An aircraft maintenance technician would be held responsible by the FAA- Boeing would be off the hook even if the plane went down. Our view is that the dealer recruits "advisors", trains them, incents them to meet sales quotas, provides the systems, policies and practices under which they operate and supervises them plus assigns a compliance officer to quality control the whole process.

The dealer gains from the active selling but when the person at the bottom of the food chain gets caught, the firm walks away. This is an attack on natural justice that ends up leaving trusting clients on their own. Dealers like it this way because they are immunized from wrongdoing and Reps like it because they know IIROC/MFDA can't collect the fines. The only loser is Main Street. Note that OBSI, with rare exceptions, rightly holds the dealer accountable for wrongdoing by "advisors" .The dealers" Trust us" marketing materials hold out the promise of integrity and fairness. It is the dealer who makes declarative statements and places marketing ads re trustworthiness and it is the dealer that should be held accountable for the actions of its representatives. In the vast majority of cases the root cause of problems lies with management and the sales culture it has created. **We therefore recommend that regulators adopt the default position that the root cause of rule breaches attribute to the dealer and that any fines levied should be to the account of the dealer.**

E. **The time for the Deferred sales charge option has past**

Kenmar have not found a good reason for investors to be sold funds on the basis of the DSC option (*The DSC sold Mutual Fund under the Microscope* http://www.canadianfundwatch.com/2015/09/the-dsc-sold-mutual-fund-under.html) . Retail investors hate to pay the DSC early redemption fee .So, rather than creating investing discipline, it keeps investors glued to their advisors with no consideration for the level of service provided.

.

The CSA says that dealers promote the use of a particular purchase option, such as the deferred sales charge (DSC) option, that pays higher upfront embedded commissions, regardless of the availability of other purchase options that may better suit the investor's needs and objectives. When being sold fund investments under the DSC option (aka "back end load" option), the investor does not directly pay a sales commission to their dealer or representative at the time of purchase .While the upfront fee paid to the dealer will show up in CRM2 cost reporting, any subsequent early redemption penalties incurred by the investor will not.

We're told that data from Investor Economics, as at December 2015, 20% of Canadian fund assets totaling $234 billion were held in the DSC option. It is also typical for trailing commission rates to double at the expiration of a DSC redemption schedule (5 to 7 years) - a trailing commission rate of 0.50% for an investment held in an equity fund under the DSC option may increase to 1.00% at the expiration of the redemption schedule. Surely, the amount of "advice" needed (or supplied) does not double simply by this administrative change. The Canadian fund market is unique in its relative reliance on DSC and low load options. While making up 20% of mutual fund assets in Canada today, these options make up less than 1% of mutual fund assets in the United States and Europe which suggests to us some form of mis-selling is taking place.

In fact a MFDA compliance review completed in Dec. 2015 uncovered instances of the inappropriate use of the DSC option including clients over age 70 that were sold funds under DSC arrangements; clients who were sold funds with DSC redemption schedules that are longer than their investment time horizon; and evidence of poor disclosure of the redemption fees at certain firms and poor suitability assessment and supervision of sales under the DSC option. In a Dec. 15, 2016 MFDA Review of Compensation, Incentives and Conflicts of Interests, the MFDA identified compensation and incentive practices that increased the risk of mis-selling funds under the DSC option. It provided a couple of examples: One firm paid some representatives as little as 10% of trailer commission on client accounts. But new sales commissions on DSC funds were paid out to the rep at rates between 40% and 75%. Another example was of a firm that paid 10% commission bonuses on sales in excess of $500,000 on DSC or low-load funds, and additional production bonuses for each $1 million of sales of DSC or low-load funds.

The DSC option makes no sense to us especially in a period of near zero front-end load (FEL). The CSA notes that although DSC options have been falling in terms of market share, assets in these series continue to grow. In total, $241 billion was held in DSC options at the end of 2015, and these options grew 19% over the last five years (largely due to the growth of low load fund series assets which grew 101% over the last five years versus 3% for traditional back-end load series). While making up 20% of mutual fund assets in Canada today, these options make up less than 1% of mutual fund assets in the United States and Europe- the question is why? Based on our experience fund investors with nominal amounts to invest are the most likely to be offered DSC purchase thus disadvantaging them along several dimensions. We note that Investors Group will be abandoning the DSC option which Morningstar estimates will impact 25% of total assets held in the DSC option. At the end of March, Dynamic Funds announced that as of

June 30, 2017 the DSC purchase option will be closed to new investments. It looks like the DSC is self-extinguishing- a positive sign.

The CSA further note that "Further analysis of MFDA enforcement files show that the DSC option can attract dealers/representatives promoting unsuitable leverage strategies on their clients or churning the client accounts .Recommendations that clients borrow to invest in funds on a DSC basis enable the dealer and their representative to increase the total compensation they can earn from the investment. Specifically, they may receive a referral fee from the financial institution in connection with their client's loan in addition to the 5% upfront commission (plus the ongoing trailing commission) they may receive from the investment fund manager on the purchase transaction." **We urge the CSA to (a) prohibit referral fees and (b) constrain fees on leveraged money as ASIC has done i.e. account fees only on <u>net</u> assets.**

In our interaction with complainants we see some salespersons recommend drawing out the 10 per cent "free" funds from a particular fund. This is a potentially positive thing, in that it reduces the potential DSC fees for the client. If the advisor moves those units of the fund to the same fund but a different class (for example, XYZ Canadian Equity fund DSC switched to XYZ Canadian Equity front-end load with no commission), that is a good thing for the client. But when the fund salesperson regularly moves those 10% "free" funds into a new fund or fund company on a DSC basis, they are simply getting another 5% upfront payment and extending the time the client is trapped in their investment. This abusive practice is not being flagged by compliance. We recommend that the SRO's immediately put dealers on notice that this practice must cease.

Another tactic we have seen is that the mutual fund salesperson coincidentally decides it is time for a change in direction. They sell the fund and put the client into a new DSC fund, starting the redemption clock all over again for the investor, and receiving a new 5 per cent upfront payment from the mutual fund company. **We recommend that the SRO's immediately put dealers on notice that this practice must cease.**

DSC in RRIF's can be a killer for seniors because of minimum annual withdrawal requirement [early redemption penalties run into the tens of millions of dollars annually].Based on our experience, lucrative trailers are the motivation for the sale of DSC funds in RRIF's and RRSP's. Note that DSC penalties cannot be offset against capital gains in registered accounts. Such irrecoverable penalties impair account returns for retirees and pensioners. **We recommend that the CSA should act immediately to phase out the DSC option regardless of any decision on embedded commissions.** [the CSA expect a decline of 15-25 bps based on the pricing practices of investment funds that separate these purchase options into unique series (as DSC purchase options typically tend to be more costly to administer than front-end or no load options].

Issues also arise when there is a fundamental change in the nature of the fund. If DSC survives, we recommend that requirements be developed to provide unitholders with an opportunity to redeem securities without penalty in the case of fundamental changes to a fund.

Mutual fund sellers claim that these fees are supposed to encourage people to "buy and hold" for a longer time. However, if somebody is not getting the level of return they expect (or the quality of service they desire), this just traps people to stay with the same fund company. Investors might be interested in "buying and holding" but with a different fund; the DSC fee effectively prevents this. **Notwithstanding any changes to embedded commissions, we urge the CSA to declare that DSC sold funds are harming investors and should be wound down**. They do not meet the requirement of dealing, fairly, honestly and in good faith with clients.

F. Fair complaint handling is essential
Fair complaint handling is particularly important for all investors, particularly seniors. In our view, investment complaint handling in Canada is exploitive. Too many valid complaints are rejected by the mere issuance of a form letter claiming the dealer is not at fault. The very public attack on the Ombudsman for Banking Services and Investments (OBSI) is symptomatic of adversarial behaviour by the financial services industry. Regulators need to meaningfully enforce the requirement that complaints be handled fairly and in a timely manner. Regulatory rules need to include requirements for detecting and promptly dealing with systemic issues. What is ultimately necessary is a clear path to financial restitution which doesn't exist now except through the difficult and expensive civil litigation process See *IIROC complaint handling rule needs an update* http://www.canadianfundwatch.com/2016/01/iiroc-complaint-handling-rule-needs.html The ineffective IIROC complaint handling rule needs an overhaul without undue delay.

OBSI only provides a *recommendation* for restitution. Due to industry intransigence, OBSI has been forced to issue "Name & Shame" News Releases which appear to have had little effect on an apparently shameless dealers.] Conclusion? OBSI recommendations should be binding on dealers. See the Independent Reviewer's complete set of recommendations at https://www.obsi.ca/en/download/fm/539/filename/2016-Independent-Evaluation-Investment-Mandate-1465218315-e9fa5.pdf The OBSI Board has already recommended that OBSI be granted binding recommendation authority. Each day that passes without such authority exposes Canadians, especially vulnerable investors, to exploitation via unjust compensation denials and low ball settlements. **The CSA must grant OBSI binding recommendation authority and agree with the strategic purpose of OBSI without further delay.**

G. IIROC OEO guidance may curtail Consumer Choice
One of the issues that will arise if mutual fund trailers are prohibited is what choices will be available to the retail investor. Clearly, direct to client firms like Steadyhand noted for being investor-friendly and which have never paid trailers, might see an uptick in business as would robo-advisors. Another viable channel might be online brokers , disparagingly referred to by IIROC as Order Execution Only dealers .IIROC are currently contemplating reining in the scope of activities permitted by what we refer to as ebrokers. They intend to redefine the meaning of *recommendation* and *advice* and

thereby limit the tools and services available to the DIY investor, a category that could swell after investors confront CRM2 reports for the first time.

If IIROC institute a much more nuanced interpretation of recommendation it will reverberate back through the rules and will impact compliance at the broker level. We think this is a bigger deal than most people are making out. As the consultation is depicted as Guidance, the CSA may not need to approve the IIROC anti-competitive initiative.

Allowing Canadians to control their own financial destiny is a stated Government objective and DIY investing fits that bill very well for basic needs. It seems to us that the CSA should examine the proposed IIROC Guidance in light of all the regulatory initiatives underway, particularly this one. Clearly there is a need for services that help investor structure portfolios and it may well be that use of these services would fall under higher accountability standards. But there is nothing stopping the implementation component, the core discount brokerage, from remaining as is and separate. We see no reason for adding regulation to the transaction engine at all.

And what of course is the value and cost of allocation components and how can we get the investor to accept the risks and returns of those components. Additionally, if the discount side does develop more tools that mirror a lower cost way of getting advice as opposed to implementation, then yes, it may attract more and more investors who are not as capable of making their own investment decisions, people who do not understand the tools or what they really mean. Could this lead to investor protection issues? In our experience we have not seen any valid investor protection concerns or an influx of client complaints related to "advice" in this channel.

Canadian investors are being squeezed by the proposed OEO guidance.....required to take responsibility for advice presented as merely guidance by regulators and not allowed to take responsibility for their own decisions when deciding to do so....nowhere to run, nowhere to hide.

We expect to see pricing for structure and advice start to develop in the open, separate from products/transactions, which would be a good thing. But of course we have to be wary of the fact that many firms may well attempt to use the discount brokerage side as a way of dumping small clients in an increasing tech world (or alternatively for larger account sizes ,improperly reverse churn them in fee-based accounts). What we are really concerned about here is preventing the development of services that could compete with the current full service (conflicted and much higher cost) business model. It is unfortunate that these issues are being addressed within a significant universal constraint and that constraint is a system which does not properly regulate advice and which is product distribution focused. In an alternate universe the same consultation would be focusing positively on how we could develop the evolution and accessibility of advice for ordinary Canadians. **We urge the CSA to require IIROC to stay its plan to constrain discount brokers.**

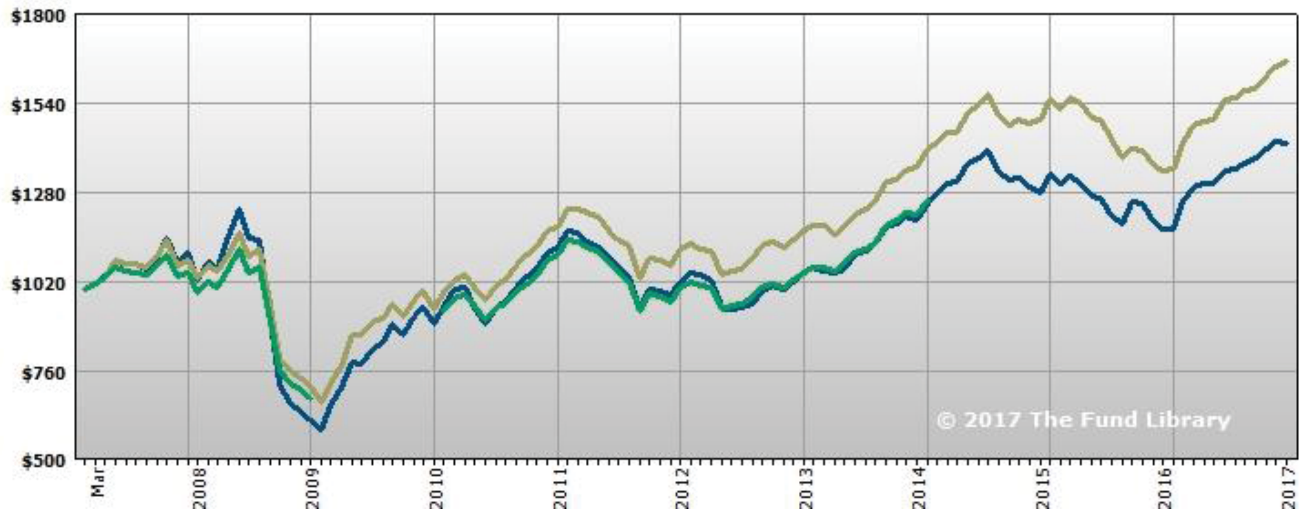
H. Canadian fund risk-adjusted performance re impact of trailers
The CSA postulate that fund managers may be aware their funds will continue to have new inflows of cash when there are relatively high trailer commissions so may have less motivation to perform well / take risks to ensure clients remain invested. The CSA state that the research that they have gathered and reviewed suggests that this inherent conflict-of-interest diminishes the investment fund manager's focus on risk-adjusted outperformance, thus impairing investor returns. There is no doubt that an embedded commission creates a conflict-of-interest.

Portfolio managers are supposed to be fiduciaries so we expect that fund governance protocols do not permit this conflict-of-interest to exist. If it does, the CSA should commence enforcement actions. For example, paying full trailers to discount brokers does It is clear that extracting fund assets to compensate distributors impairs fund returns.

The fact that dealers promote higher margin products seems to play out in that direct-to -client fundcos with solid performance have difficulty attracting clients and index products are rarely sold despite their positive advantages for the small investor. The latest SPIVA report demonstrates that the majority of Canadian actively-managed mutual funds do not beat their passive benchmark over longer time periods. The comparison is not totally valid however because the index is costless and frictionless and does not include the cost of distribution (aka “advice”). **We would need to see a deeper analysis to conclude that competitive market forces (based on after -fee performance) are insufficient to overcome the implied conflict-of-interest created by distribution channel access achieved by trailers.** There may be other forces at work.

A G&M article *Canadian mutual funds are the world leader in closet indexing* http://www.vandermeerwealth.com/pdf/Canadian_mutual_funds_are_the_world_leader_in_closet-indexers.pdf suggests that sub-par performance may be deliberate, not necessarily due to the influence of trailer commissions. In their paper, **Indexing and Active Fund Management: International Evidence,**” four professors of finance – Martijn Cremers of Notre Dame, Miguel Ferreira of the Nova School of Business and Economics, Pedro Matos of the University of Virginia and Laura Starks of the University of Texas at Austin – estimate that about 37 per cent of the assets in equity mutual funds sold in Canada are in closet indexers. The implication here is that Canadians are paying for active management but are not receiving it. Depending on the magnitude of the shortfall, the impact on returns could be more significant than the effect of trailers.

See for example TD Canadian Equity A (MER=2.18 %, Assets $ 4.9 billion



Blue: TD Canadian Equity Fund - A
Gold: S&P/TSX Composite Index TR Benchmark
Green: Fund Library Canadian Focused Equity Average

Showing chart for past 10 yr(s).

Chart period: 10 Years GO

We eagerly await the results of the CSA investigation into closet indexing.

The Cumming report results can also at least be partially explained by forces in addition to trailer commissions. For instance, it can be argued that the bank branch network is so convenient for most time- pressed Canadians that investable cash does not necessarily flow to top performing funds but rather to "OK" proprietary funds readily available at bank branches. At the end of 2015, 69 % of assets in the MFDA channel were held at dealers that focussed primarily on proprietary funds. This may be why independent fundcos like Fidelity and Invesco have to have superior returns to attract assets from a smaller segment of the investing population that actually pay attention to fees, performance, risks and taxes.

In our view, it is the structure of the Canadian fund distribution channels that is the dominant factor in influencing fund flows even after considering the not insignificant impact of trailers. Eliminating trailers without implementing other reforms may have the unintended effect of concentrating fund assets even further with bank and insurance owned dealers [Deposit –taker and insurer owned fund dealers dominate fund distribution in Canada. At the end of 2012, of the 37% of households that owned investment funds, 87% purchased their funds through a deposit-taker/insurer owned distributor while only 18% purchased their funds through an Independent/other fund distributor; according to Morningstar data, the banks' combined share rose from 39% at the end of 2011 to 48% by September 2016.] .This growing dominance may not be unacceptable to regulators but at least it should be a factor in restructuring / redesigning the “advice” (“wealth management") business in Canada.

I. Rules without Enforcement are just words

According to the 2013 CFA Institute Global Market Sentiment Survey, financial firms have themselves to blame for the lack of public trust in the industry. The survey found that over half of the respondents outside of Canada (56%) believed that the lack of an ethical culture within financial firms was the biggest factor contributing to the current distrust of the financial industry. In Canada that number was slightly higher at 58%.According to the survey participants, one way to regain the public's trust is through the improved enforcement of existing laws and regulations. Globally, 24% of CFA members agreed with this approach. Of the CFA members surveyed in Canada, 27% felt this was one of the best ways to improve investor trust and market integrity. Source: http://www.cfainstitute.org/about/research/surveys/Pages/global_market_sentiment_survey_2013.aspx We have been advocating this since 2005.

As we have pointed out many times before, that without robust enforcement, the rules don't matter much. We have for years illustrated how few investor complaints are actually investigated by SRO's and Commissions. When we review Hearing Panel decisions we find the bulk of actions are against individuals rather than the root cause of most issues, the dealers. When the dealers are investigated we find that mitigating factors overwhelm aggravating factors, sanctions are modest and root causes are not resolved. More recently, we have seen how the regulators have handled the so-called double dipping scandals. A major aspect of the scandals revolved around fee-based accounts and A class mutual funds paying trailers commissions. In effect, the dealers were collecting fees twice over long periods of time.

Steadyhand president Tom Bradley summed up investor displeasure at the regulatory settlements in these words". *“Then there were four. Four banks have now disclosed to the Ontario Securities Commission that they were overcharging their wealth management clients. BMO is the latest to self-report that they were double charging their clients (following in TD, Scotia and CIBC’s footsteps). In a no-contest settlement last week, the bank agreed to compensate 60,000 clients to the tune of $50 million. The BMO case is interesting because the overbilling was not just isolated to BMO Nesbitt Burns, the brokerage arm. It was endemic, with clients also being overcharged in BMO Private Investment Counsel, BMO Investments (bank branches) and BMO InvestorLine (discount broker). .. In my view, these four institutions are getting off way too easy, as are the advisors and branch managers involved. Fee-based accounts, which caused most of the problems here, are not complicated, so the overcharging can’t be blamed on a systems error. I can assure you that in investment firms, inputs or factors that impact compensation are never overlooked (30 years of managing investment professionals allows me to say that). The banks' systems may be inadequate, but they are not the reason for this betrayal of client trust. They also got off easy because all four announcements were reported one day and forgotten the next. And the fines paid to the OSC were token. The big amounts (i.e. $50 million for BMO and $73 million for CIBC) simply involved returning the clients’ own money to them (with 5% interest).”* 50 million more reasons for CRM2 - Episode 4 - by Tom Bradley https://www.steadyhand.com/industry/2016/12/21/fifty_million_more_reasons_for_crm2/

Investment Fee Overcharging Summary: PIAC

Institution	Reimbursement to Clients	Number of Accounts Affected	Duration of overcharging	Contribution to Investor Protection Initiatives	Date of Settlement
BOM	$49.9 Million	60,393	2008-2016	$2.1 Million	December 2016
CIBC	$73.2 Million	81,575	2002	$3 Million	October 2016
Bank of Nova Scotia	$20 Million	45,703	2008 to 2015	$800,000	July 2016

Quadrus Investment Services Ltd.	$8 Million	3,329	2011	$250,000	November 2015
CI Investments Inc.	$156.1 Million	360,000	2009 to 2015	$8 Million	February 2016
Totals	**$320.7 Million**	**515,777**		**$14.75 Million**	

*This was one category of violation where the number of affected accounts was not listed.

Another example of lax enforcement:
This is a very puzzling comment from the CSA Footnote 62, page 41

Advisor class units that are offered by some ETF providers are designed for advised investors and are meant to be purchased through an advisor. The only difference between this class of units and the common class units is the trailing commission component (or alternatively denoted the "service fee" component) embedded in the management fee of the Advisor class. We do not know if these holdings of Advisor class units in the online/discount brokerage channel are a consequence of previously advised assets transferring in or are due to investor error. However, we note that some discount brokerages do make Advisor class units available for trade on their platforms.

Given this knowledge, how can the CSA / IIROC possibly justify non-intervention? The mere offering of Advisor Class in these instances is wrong, contrary to the duty to act fairly, honestly and in good faith and basic morality. This is nothing more than a money grab. When the CSA makes findings like this, they have to publicize and name names. Should the public not know which discount brokers do this? It provides a signal as to ethics. In CP 33-404, the CSA makes a big deal out of information asymmetry yet when it is in a position to even out the information imbalance it appears quite reluctant to do so. **Kenmar are of the firm conviction that this lack of meaningful and timely enforcement of existing rules is a major cause for so many negative retail investor outcomes.**

APPENDIX III: Research Reports and materials we considered

The documents listed below paint a clear picture. The takeaway message is that the mutual fund industry has evolved into a sales and marketing culture. Sales incentives like trailers support this culture .Any financial advice provided is incidental, undefined and ad hoc and unregulated. Fund industry lobbyists have been successful in blunting reforms in the $1.3 trillion Canadian mutual fund industry. This has however resulted in needed investor reforms being delayed or derailed.

There have been periodic attempts to break the embedded commission model and give DIY discount investors what they want: the stock-picking prowess of portfolio managers but without advice. In 2004, E-Trade Canada announced it would sell the F class funds of Invesco Trimark Investments and Elliott & Page. Self-directed investors cheered but both firms soon reversed themselves after the rest of the industry made known its deep displeasure. Today Questrade Inc. has its Mutual Fund Maximizer program, which rebates trailers on most big broker-sold funds. A few fund companies offer F series, so Maximizer broadens the range of funds from which to choose. But some discount brokers that offer trailer rebates have been told to stop the practice for their funds. In 2013, a major bank-owned discount broker cut top performing Steadyhand funds out of its lineup because it does not pay trailers. It varies from dealer to dealer, and it changes from time to time. Some don't charge anything - Qtrade, iTrade and BMO Investorline. The others mostly charge a fee for either the purchase or sale, but not both- fees vary considerably.

We are informed that at least one bank-owned dealer has removed Steadyhand, Mawer and Leith Wheeler from their platform because they don't pay a trailer. If trailers are banned, we'll probably see more pricing uniformity. Our preference would be that DIY investors get charged the same commission they get on ETF trades - i.e. $9.95 or less. [Industry talks about investor choice but discount brokers are distorting the market by keeping these low cost funds away from DIY investors See *Purchasing Steadyhand through Discount Brokers - Clearing the Air - Steadyhand Investment Funds* (2013) https://www.steadyhand.com/industry/2013/03/27/purchasing_steadyhand_through_discount_brokers_clearing_the_air/]

If the industry was client-focused , fund manufacturers would reduce price breakpoints, introduce more D Series funds and eliminate DSC money market funds .It seems odd that investor advocates, bloggers and personal finance journalists promote TD's low cost eFunds more than TD does. TD distributes moderately priced index options to its online brokerage customers but none through bank branches. This is an industry that treats dealers/"advisors" better than customers. That's why **we would recommend the CSA to introduce competition and investor choice via access to U.S. Mutual funds as is already the case for ETF's.**

The commission-based system corrupts dealer and "advisers" Back in 2005, the MFDA said it was aware that a number of MFDA members had entered into referral arrangements with Portus, a controversial and troubled fund, regarding managed accounts involving BancNote Trust Series investments. It said "MFDA members in the affected jurisdictions must immediately cease referring clients to Portus during the period covered by the temporary order and any subsequent orders," the MFDA says. The regulator also directed dealer to "take appropriate steps" to determine if any of their Reps have entered into referral arrangements directly with Portus and if so, to cease such activity immediately. It reminded dealers and Reps that securities-related referrals cannot be entered into by Reps either directly or indirectly through another entity, such as an insurance agency or a personal service corporation, these sorts of referrals can only be made through an MFDA member. Over 20 % of Portus assets were acquired by referral arrangements that paid outsized sales commissions. A key fact about which there is clarity is that Portus paid exorbitant fees to advisors who referred their clients to Portus and provided them with sales incentives that would be banned if the investments their clients were making were in conventional mutual funds. It is also clear that the dealers/advisors who referred their clients to Portus did not look beyond the dollar signs and sales incentives in determining the suitability of the Portus investments for their clients. Nor did they seem to understand or appreciate the need for due diligence inquiries respecting the nature, structure and governance of these investments, or the nature and validity of the principal-protection arrangements. The arguments that the dealers/advisors were relying on Portus to do this points out serious weaknesses in the securities regulatory system.

Canadian Fund Industry Overview

Recently CSA sponsored research (2016) on mutual fund commissions' influence on fund flows led by Douglas Cumming, finance professor at the Schulich School of Business at York University in Toronto - and the related Frequently Asked Questions document - has triggered passionate responses. The research found that commissions and "related dealers" (those affiliated with fund manufacturers) result in higher fund flows regardless of portfolio performance. The fund industry - and financial advice providers - downplayed the report, urging regulators to do more analysis before making any policy changes. The industry's automatic "no" response to virtually every investor-friendly proposal risked bringing on the very commission ban the industry now faces. Each time such an idea surfaces, the industry seemingly puts up roadblocks rather than making constructive suggestions to move proposals forward.

Mind the Gap: Active Versus Passive Edition Morningstar
Key Take-Aways
1) The biggest costs investors tend to incur don't show up on a fact sheet but are a product of their own bad behavior.
2) Investors in passive funds have tended to pay smaller bills for their conduct over time.
3) Index fund investors' reasonable expectations, or as Bogle has referred to it, index funds' "relative predictability," go some way toward explaining their exemplary behavior.
4) Channel-specific considerations have also played a part. 401(k) plans are a pipeline for legions of disciplined investors.
http://ibd.morningstar.com/article/article.asp?id=755644&CN=brf295,http://ibd.morningstar.com/archive/archive.asp?inputs=days=14;frmtId=12,%20brf295

Two ways mutual fund investors get burned; First they get scorched by fees, then behavioural silliness compounds the problem: They chase funds with strong track records
The typical Canadian ETF beats its actively managed counterpart by almost 2 per cent a year, after fees. If Canadian investors behave as poorly as those in the United States, those in actively managed funds would give up a further 1 per cent a year by chasing past returns. On the flipside (as mentioned above), Morningstar says index-fund investors outperformed their funds by 0.58 per cent annually during the same time period ended Dec. 31, 2015.If that were true in Canada, those who invest in index funds might beat those who invest in actively-managed funds by more than 3.4 per cent a year. You can make a lot more money if you can avoid getting burned.

The Market for Conflicted Advice by Briana Chang, Martin Szydlowski: SSRN
Abstract: We study decentralized markets in which advisers have conflicts of interest and compete for customers via information provision. We show that competition partially disciplines conflicted advisers. The equilibrium features information dispersion and sorting of heterogeneous customers and advisers: advisers with expertise in more information sensitive assets attract less informed customers, provide worse information, and earn higher profits. We further apply our framework to the market for financial advice and establish new insights: it is the underlying distribution of financial literacy that determines the consumers' welfare. When advisers are scarce, the fee structure of advisers is irrelevant for the welfare of consumers.

Banks misleading clients on mutual funds - Canada - CBC News
http://www.cbc.ca/news/canada/banks-misleading-clients-on-mutual-funds-1.1415027
Research: Top 10 Issues Facing the Canadian Asset Management Industry
http://www.pwc.com/ca/en/investment-management/publications/top-10-issues-facing-canadian-industry-2010-09-en.pdf Mutual fund companies today face the challenge of differentiating themselves in the industry. As a result, fund companies are increasingly looking to their business models to acquire and retain assets. To succeed, fund managers will not only need to develop a robust distribution model, but focus on delivering knowledgeable, quality advice. Indeed, the advice channel in Canada is gaining importance amongst investors, which could be attributed to the complexity of funds, especially given the myriad of offerings and providers that investors can choose from and the positive experiences when using an advisor. In addition to mutual funds, investors are faced with numerous investment choices like exchange-traded funds (ETFs), wrap accounts, principal-protected notes, segregated and hedge funds. To better understand these products and how they fit in their portfolio, investors are looking for trusted professional advisors.

Margin of error: Why advisors shouldn't be off-book loan distributors - Investment Executive
"Interestingly, B2B Bank doesn't consider its clients to be the people who borrow from it. In its own corporate profile, B2B says its "client communities" are advisors and dealers. It sees itself as a lender "that serves a network of 27,000 financial professionals." It reassures them that "we don't compete with our clients by offering products directly to the public." No, indeed. Under this business model the manufacturer doesn't sell its products (investment loans) directly to consumers. Instead, the manufacturer's clients (advisors and dealers) are utilized, in effect, as product distributors. They're the sales force for these loans..."

Stromberg report on mutual funds (1998)
http://www.sipa.ca/library/SIPAdocs/Stromberg_InvFunds-Oct1998.pdf

The Fund Library: Columns: **New fund risk-ratings regime a blessing in disguise?**
"...Now this does not mean that all managers will immediately lower the risk rating for these funds, because they do have the discretion to keep the ratings higher. However, understanding that lower risk ratings can increase the pool of potential investors and thus increase sales, it is logical to think that if some companies begin to lower their risk ratings, other will soon follow. It will also be interesting to see what happens in 2017 when the volatility we saw during the financial crisis in 2007 and 2008 begins to drop out of the 10-year SD calculation. If we do not experience a spike in market volatility within the next year, the volatility numbers will begin to fall and inevitably, so will risk ratings. So what at first what looked like an attempt by the regulators to increase the risk ratings in the fund industry could potentially give managers the ammunition they need in order to lower the ratings on many of their funds. Stay tuned...."
http://www.fundlibrary.com/features/columns/page.asp?id=16061 Kenmar continue to believe the CSA has created a risk disclosure system that will mislead investors and cause them harm. It is by far the world's worst fund risk disclosure system.

The lowdown on paying for referrals | Advisor.ca
http://www.advisor.ca/my-practice/paying-for-referrals-13121

Indexing and Active Fund Management: International Evidence January 5, 2015
Abstract: We examine the relation between indexing and active management in the mutual fund industry worldwide. Explicit indexing and closet indexing by active funds are associated with countries' regulatory and financial market environments. We find that actively-managed funds are more active and charge lower fees when they face more competitive pressure from low-cost explicitly indexed funds. A quasi-natural experiment using the exogenous variation in indexed funds generated by the passage of pension

laws supports a causal interpretation of the results. Moreover, the average alpha generated by active management is higher in countries with more explicit indexing and lower in countries with more closet indexing. Overall, our evidence suggests that explicit indexing improves competition in the mutual fund industry.
https://papers.ssrn.com/sol3/papers.cfm?abstract_id=1830207

90% SALES 10% ADVICE :A SNAPSHOT OF THE FINANCIAL PLANNING INDUSTRY
http://www.industrysupernetwork.com/wp-content/uploads/2011/10/A-snapshot-of-the-financialplanning-industry-110930-1010version.pdf "The facts set forth in the report support the position long held by ISN that ongoing commissions and asset-based fees for advice enable planners and dealer groups to earn 'passive' income at the expense of consumers and should be banned, along with all other forms of conflicted remuneration. If ongoing asset-based fees are permitted to continue, credible reform requires that these fees be subject to a regular 'opt-in' mechanism. The ASIC [Australian Securities Commission] report has pulled back the curtain to reveal the extent to which the structure of the financial planning industry impedes planners from being able to act in the best interests of their client. The Future of Financial Advice reforms are essential to restructure this industry to serve the interests of clients, who are relying on advisers to help them save for retirement, build wealth, and otherwise manage their financial lives. However, the financial planning industry has stridently opposed the key aspects of reform legislation that would clean up their industry. The ASIC report makes this opposition easy to understand: this is an industry built around conflicted remuneration and passive income charged to millions of unwary clients (often from their compulsory super) who receive no ongoing services. "

Banning Investment Commissions – moving beyond "if" towards "how" | Chalten Fee-Only Advisors Ltd. | Blog
We continue to emphasize that the root cause of the Caveat Emptor advice environment is management, not the front line dealer Reps. A large minority are merely trying to survive in a toxic environment and do what they can to protect their clients. The low recruitment criteria, attractive sales inducements and weak compliance systems created by Bay Street management are the cancer that permeates the so-called Wealth Management industry today. Prohibiting trailers may be necessary but it is not sufficient to bring about a trusted advisory marketplace.

Investing industry is a drag on returns- by design
http://www.theglobeandmail.com/globe-investor/investment-ideas/strategy-lab/growth-investing/why-mutual-funds-hurt-your-returns/article4619712/ "..One simple example of that drag is the fees charged by actively- managed mutual funds. Those levies take a big bite out of your returns. Andrew Hallam, the millionaire teacher and a fellow Strategy Lab contributor, has written compelling articles demonstrating that actively-managed funds underperform a broad stock market index. He's right." G&M Oct 18, 2012. , Pg B16

Conflict -of- interest part of DNA In "Conflicts of Interest and Competition in the Mutual Fund Industry," Ajay Khorana (Georgia Institute of Technology) and Henri Servaes (London Business School) examine how conflicts-of - interest in the U.S. mutual-fund industry affect competition and investor behaviour (their database covered the period 1979-1998). Overall, their paper "highlights a number of conflicts between fund families and investors," say the authors. For example, they found "no evidence that investors derive any benefit" from annual fees for marketing and distribution (12b-1 fees in the U.S). Furthermore, "fund families generally want to maximize assets under management … and the resulting management fees," an objective at odds with investors' "desire for high risk-adjusted performance at low cost."

Should Canada's financial advisors be held to a fiduciary standard?

The Cost of Active Investing Tuck School of Business at Dartmouth; National Bureau of Economic Research (NBER) April 9, 2008
Abstract: I compare the fees, expenses, and trading costs society pays to invest in the U.S. stock market with an estimate of what would be paid if everyone invested passively. Averaging over 1980 to 2006, I find investors spend 0.67% of the aggregate value of the market each year searching for superior returns. Society's capitalized cost of price discovery is at least 10% of the current market cap. Under reasonable assumptions, the typical investor would increase his average annual return by 67 basis points over the 1980 to 2006 period if he switched to a passive market portfolio.

A Dissection of Mutual Fund Fees, Flows, and Performance by Douglas J. Cumming, Sofia Johan, Yelin Zhang: SSRN
Abstract: This paper provides a dissection of both mutual fund fees and flows into several categories, and presents evidence that relates specific components of fees to flows, and fees and flows to performance. For stand-alone funds that cannot be purchased directly from fund managers, fees that compensate fund advisors when investors maintain their portfolio positions, and fees that penalize investors for early withdrawal, have a much

flatter flow-performance relationship ("flow-performance slope"), and higher flows regardless of past performance ("flow-performance intercept"). Further, the data indicate that flow-performance intercept and slope are significantly negatively and positively, respectively, related to future risk-adjusted performance, which is consistent with the view that flow-performance provides a strong incentive to generate future returns. These findings are quite stable over time, and robust to numerous sensitivity checks. We find some consistency in the evidence but less robust statistical significance amongst the subsamples of direct purchased funds, and among fund-of-funds.

Favoritism in Mutual Fund Families? Evidence on Strategic Cross-Fund Subsidization by Jose-Miguel Gaspar, Massimo Massa, Pedro P. Matos: SSRN
Abstract: We investigate whether mutual fund families strategically allocate performance across their member funds favoring those more likely to generate higher fee income or future inflows. We find evidence of strategic cross-fund subsidization of 'high family value' funds (i.e. high fees or high past performers) at the expense of 'low value' funds in the order of 6 to 28 basis points of extra net-of-style performance per month, depending on the criteria. This overperformance is above the one that would exist between similar funds not part of the same fund family. We further document how this family strategy takes place by looking at preferential allocation of IPO deals and at the amount of opposite trades among 'high' and 'low value' funds belonging to the same fund complex (a practice that can encompass 'cross-trading'). Our findings complement the existing literature on distortions in delegated asset management by highlighting the role played by family affiliation. They are also relevant to the regulatory debate concerning 'cross-trading' between funds under common management.

Impact of Fees on Investor Returns

Numbers and percentages Most economists protect the returns for the decade ahead. This could have a major effect on the impact of product fees on your retirement security. In the past, if the benchmark return was 10 per cent and you under performed by 2%

then you left 20% of this potential return on the table. Going forward if the benchmark return is 6% and you still underperform by 2%, now you're still taking all the risk but you've left one third of the potential return on the table. Pay attention to product cost and account fees- they are more important than ever before. Be sure to scrutinize the new personalized cost reports that dealers will be issuing to you shortly.

Research: The $25 billion annual mutual fund rip-off
http://cupe.ca/pensions/The_25_billion_annua
A comprehensive study by Canadian pension fund expert Keith Ambachsheer has found that defined benefit pension plans in Canada achieved annual average returns at least 3.8% higher than mutual funds with comparable investments. Defined Benefit pension funds outperformed the market by 1.23% per year, while mutual funds had average returns that were 2.6% below the market during the 1996 to 2004 period. Returns for most mutual investors were even less than this, as a result of sales fees and consistently poor selection of mutual funds by misinformed investors: buying high and selling low. This means that those with savings in mutual funds lost a total of about $25 billion a year from the higher management fees and lower returns compared to workplace pension funds. Higher management fees are responsible for about $15 billion of this.

Wrap accounts add costs but yield questionable benefits .The CSA confirms our experience with wraps. Over the last several years, wrap accounts (fund-of-fund products) have grown in popularity, now accounting for approximately 47% of long-term mutual fund assets under management, up from 37% in 2006 .Wrap .accounts hold substantial appeal for Reps since they are per-packaged mutual fund investment portfolios which eliminate having to do any fund selection and asset allocation . In the case of a wrap, the advisor need only assess the suitability of the top level fund rather than assess the suitability of every fund in the portfolio. Notwithstanding the dramatic workload decreases that wraps provide for dealer Reps, the trailing commissions payable on wraps are the same or higher than on stand-alone equity mutual funds. We have found no evidence clients obtain more face time with Reps; instead we are told, the time freed up is used for prospecting for even more buyers. Fund manufacturers also gain by sales [AUM] of their own proprietary funds rather than using Best-in-Class funds. The client ends up with a package of expensive funds whose asset allocation is not tailored to their individual needs, personal situation and objectives.

A fund-by-fund break down of the hidden advice fees Canadians are paying - The Globe and Mail
http://www.theglobeandmail.com/globe-investor/funds-and-etfs/funds/table-trailer-fees/article29792039/

Investment fees cost Canadians hundreds of thousands
Next to buying a home, fees paid on investments can be the single biggest lifetime expense many Canadian households will have to deal with. Over the course of an investor's life, mutual fund fees can end up costing the average Canadian household $323,654.40, according to Nest Wealth, a Toronto-based digital wealth manager (www.nestwealth.com). "Put in context, the average Canadian household will spend $80,000 more on investment fees than they'll spend to raise their child to the age of 18," says Randy Cass, founder and CEO of Nest Wealth. "It's not surprising that Canadians feel like no matter how much they try to save, they keep falling further behind their goals."

Wrap mutual fund disappointment
http://www.fa-mag.com/news/wrap-mutual-fund-disappointment-12154.html

Wrap Account Ripoff (Forbes.com): "In 2007 Josephine DesParte, an 88-year-old Chicago widow, had $8 million tucked into an account at William Blair & Co. One-quarter of it was in municipal bond funds and cash and the rest in three stocks dear to her heart: Together the securities were generating more than $100,000 in annual dividend and interest income. DesParte's coupon-clipping strategy made good sense for the widow, but she claims the inactivity made the commission-based account a dud for William Blair. In October 2007 brokers Brian L. Kasal and William H. Ross persuaded DesParte to begin selling her stocks and many of her bonds and to diversify into a number of blue chips. They also moved her into a wrap account, which, DesParte would later claim, gave William Blair the advantage of shaving off 1.5% of her assets a year, or $120,000, in annual fees. The brokers' moves further saddled her with a $322,000 capital gains tax bill for 2007, DesParte claimed. DesParte filed a $2 million claim with the Financial Industry Regulatory Authority seeking compensation for wrongful investment losses and taxes. She was awarded $1.1 million in November 2009.
http://www.forbes.com/forbes/2010/0412/investing-brokerage-commission-retirement-finra-ripping-you-off.html?boxes=Homepagetmagazines " Needless to say, wrap accounts and managed accounts are on the upswing in Canada and wreaking havoc with portfolio performance.

Research: Why Does the Law of One Price Fail? An Experiment on Index Mutual Funds

http://www.ncbi.nlm.nih.gov/pmc/articles/PMC2872995 ABSTRACT : We conduct an experiment to evaluate why individuals invest in high-fee index funds. In our experiments, subjects allocate $10,000 across four S&P 500 index funds and are rewarded for their portfolio's subsequent return. Subjects overwhelmingly fail to minimize fees. We can reject the hypothesis that subjects buy high-fee index funds because of bundled non-portfolio services. Search costs for fees matter, but even when we eliminate these costs, fees are not minimized. Instead, subjects place high weight on annualized returns since inception. Fees paid decrease with financial literacy. Interestingly, subjects who choose high-fee funds sense they are making a mistake.[The composition of their subject pool , college staff/MBA students made it more likely that they would find support for rational theories; given the dismal results it is thus no surprise that ordinary Canadians have trouble figuring out fund fees]

The behaviour of individual investors
https://www.umass.edu/preferen/You%20Must%20Read%20This/Barber-Odean%202011.pdf

OSC Investor Advisory Panel Report Conflicted compensation can undermine the trust that is an integral part of the advisor client relationship. The Panel's 2013 Survey Findings on Adviser/Investor Relationship http://www.osc.gov.on.ca/en/Investors_nr_20130318_iap-adviser-investor-relationship.htm found that only 20% of investors strongly agree that they trust their financial advisor's advice while 64% overall believe that how a financial advisor is paid impacts the recommendations they receive. Furthermore, a majority (58%) rely on their financial advisor as their main source of information and yet more than 4 in 10 don't know how their advisor is being paid. The Panel also saw strong support for a statutory best interest duty – 93% agree that it is needed.

Global Fund Investor Experience Study: Morningstar June 2015
https://corporate.morningstar.com/US/documents/2015%20Global%20Fund%20Investor%20Experience.pdf Canadian mutual fund fees are among the highest fees in the world as supported by numerous independent research studies [portfolio transaction expenses add to investor costs but are not included in the MER]. Needless to say, this severely impairs the retirement income security of Canadians.

High Fees Destroy Bond Fund Performance | Morningstar

Banning Trailer Commissions Could Give Canadian Investors a Wealth of Lower-Cost Products | The Motley Fool Canada
http://www.fool.ca/2017/01/13/banning-trailer-commissions-could-give-canadian-investors-a-wealth-of-lower-cost-products/

Uncovering the hidden fees: Questrade
http://media.questrade.com/downloads/manuals/crm2_free_guide.pdf

Trailer commissions are BIG $$'s http://www.thestar.com/business/article/846861--daw-industry-defends-mutual-fund-trailer-fees According to a August 12th 2010 article by the Toronto Star's James Daw , *Industry defends mutual fund trailer fees* , a lot of money is at stake. He quotes Carlos Cardone, senior consultant with research house Investor Economics who says about $2 billion was deducted from Canadians' mutual fund assets in 2009 to pay advisers what are called trailer commissions. That compares with about $9.5 billion in the U.S., with ten times the population. The Canadian figure excludes what banks embed in their funds to pay sales and advisory staff. Bank funds hold roughly 30 % of total mutual fund assets in Canada. According to the CSA Consultation "A significant portion of the management fees earned by most Canadian mutual fund manufacturers on the mutual funds they manage is used to pay an ongoing commission to dealer firms. This payment was originally intended to compensate dealer firms for the ongoing services their advisors provide to investors after the mutual fund purchase, including investment advice. This is generally referred to as the "trailer fee" or "trailing commission"...Trailing commissions are usually paid by mutual fund manufacturers to dealer firms quarterly for as long as their clients hold investments in the manufacturers' mutual funds. Each dealer firm then pays out a portion of those trailing commissions to its representatives according to the firm's own compensation grid. Generally, under this compensation grid, the more commission or fee revenue the advisor generates for the firm, the greater the portion of that revenue the advisor gets to keep." There is ZERO connection to the amount or quality of advice provided or any measures of client satisfaction.

How much do actively-managed mutual funds cost investors?
http://independentinvestor.info/content/view/961/236/1/0/ "When you add up the numbers for MER, taxes and load fees you come up with the following (what is sometimes called the croupier's take; see Davis 2009 Reveal the true cost of the croupier's take doc.1825).In the US -the MER, impact and load costs add up to 3.87% of fund investments. In Canada - the comparable number is 5.13%. Therefore, the typical US and Canadian equity funds needs to outperform their index benchmarks by almost 4% and by more than 5%, respectively, in the two countries before its investors do better than the market as a whole. This is a major challenge, and the odds of any active fund manager overcoming these types of numbers are very poor. And remember these numbers do not take into account expense categories 2 (non-MER MER expenses), 3

(non-traditional management fees), 4 (mutual fund shenanigans) and 7 (risk premium) in our list because we have not been able to quantify them but which are nevertheless very real expenses."

Influence of "Advisors"

Research: *What is the Impact of Financial Advisors on Retirement Portfolio Choices and Outcomes?* http://www.nber.org/programs/ag/rrc/NB10-05%20Chalmers,%20Reuter%20FINAL-revised.pdf

What Do Financial Advisors Do? | Investopedia
Does your "advisor" perform these tasks?
http://www.investopedia.com/articles/personal-finance/050815/what-do-financial-advisers-do.asp

Financial Advisors: A Case of Babysitters? by Andreas Hackethal, Michael Haliassos, Tullio Jappelli: SSRN
Abstract: We use two data sets, one from a large brokerage and another from a major bank, to ask: (i) whether financial advisors are more likely to be matched with poorer, uninformed investors or with richer and experienced investors; (ii) how advised accounts actually perform relative to self-managed accounts; (iii) whether the contribution of independent and bank advisors is similar. We find that advised accounts offer on average lower net returns and inferior risk-return trade-offs (Sharpe ratios). Trading costs contribute to outcomes, as advised accounts feature higher turnover, consistent with commissions being the main source of advisor income. Results are robust to controlling for investor and local area characteristics. The results apply with stronger force to bank advisors than to independent financial advisors, consistent with greater limitations on bank advisory services. http://www.csef.it/WP/wp219.pdf

The value of advice- an investor viewpoint
http://www.investingforme.com/pdfs/reports-studies/Advice-An-Investor-View.pdf

Why Don't Most Financial Planners Plan Finances?
A recent article http://www.milliondollarjourney.com/why-don%E2%80%99t-most-financial-planners-plan-finances.htm on financial planning stated:" While many financial planners claim to do financial planning and provide holistic advice, very few actually provide comprehensive planning with written financial plans, as taught in the CFP courses.The issue is best highlighted by Alan Goldhar, Professor of Financial Planning at York University and Manager for the Ontario Public Trustee. The Public Trustee takes over the finances for people that are mentally unable to make financial decisions. They have taken over more than $500 million in investments for 10,000 clients, most of which had a financial planner, broker or bank advisor. They interview the client and the family and then send in a team to obtain all financial documents. The shocking fact is that, of the 10,000 clients they took over, none had a financial plan! Not one!". For seniors, such a state of affairs is more than troubling.

Advisor Risk
https://docs.google.com/viewer?a=v&pid=forums&srcid=MDQyNjM4MzIyMTkzMjczODgyNDABMTQxNTYxNzExMTMwMjcyMzE2NzEBV2lUMEYtb1ZrejBKATQBAXYy Trailer commissions are embedded in the management fee rather than shown separately. Many retail investors mistakenly believe there is no cost to buying or owning a mutual fund. They don't grasp the long-term significance of distribution costs on account performance. Dealer Representatives aren't required to disclose all forms of their compensation that they earn from clients' fund investments. If mutual fund costs and compensation practices aren't mentioned to clients, they don't become a factor in a client's decision-making. This creates a risk for unsuspecting clients.[Costs deter only one of six investors from buying, according to an Investor Education Fund survey which is a major financial competency problem in itself.]

The value of advice: An investor viewpoint Kenmar Associates
http://www.investingforme.com/pdfs/reports-studies/Advice-An-Investor-View.pdf

Financial Abuse - (this insightful exposition was written several years ago before the IDA morphed into IIROC). Author Andrew Teasdale is an expert on suitability, KYC and portfolio construction)
http://moneymanagedproperly.com/new_folder/rights%20and%20abuse/financial%20abuse.htm **" "...Trailer fees:** Trailer fees are annual fees paid by a mutual fund company to an investment advisor for recommending the mutual fund. The investor does not need to be told about this even though the money is paid from the investor's own funds. Likewise the advisor has no obligation to do anything for the client to earn these fees. Trailer fees and other referral type fees are an abuse of the client -advisor relationship and, unless these fees are disclosed and used to offset valid and identifiable services performed by the advisor, they increase costs and are detrimental to an individual's financial position. The greed of the industry has seriously affected the ability of mutual funds to meet the objectives and needs of the individual. Indeed, the benefits of one of the most efficient investment vehicles ever invented have been submerged under the self- interests and costs of an industry that has lost sight of its reason for being...." [The fact that trailer commissions as a percentage of "adviser" income has risen since 1996 was not known to retail investors .The lack of disclosure added to investor risks and may explain the apparent increase of leveraging and the rapid rise of wrap accounts]

Financial Advisors Encourage Bad Behavior
http://www.forbes.com/sites/rickferri/2012/03/30/financial-advisors-encourage-bad-behavior/

The Market for Financial Advice: An Audit Study This working paper by Sendhil Mullainathan (Harvard), Markus Noeth (University of Hamburg), and Antoinette Schoar (MIT), was recently published by the National Bureau of Economic Research (NBER), a private, non-profit, non-partisan research organization. Most individual investors consult a financial advisor before purchasing investments. Given the central role of advisors in the investment process, Mullainathan, Noeth and Schoar tested whether financial advice serves to de-bias individual investors and thus correct mistakes they might make without these inputs, or whether advisors encourage the same bad behavior. The study defines 'good advice' as recommendations that move investors toward a low-cost, diversified index fund approach, which textbook analyses on mutual fund investing suggests. Overall, their findings suggest that the market for financial advice does not alter individual investor biases, and if anything may exaggerate existing biases. They also found that advisor self-interest plays an important role in generating recommendations that are not in the best interest of the clients. They are unwilling to lean against these biases even when they know they exist because not doing so helps them further their own economic interest.

Research on Fund fees: Out of Sight, Out of Mind: The Effects of Expenses on Mutual Fund Flows
http://faculty.haas.berkeley.edu/odean/papers%20current%20versions/Out%20of%20Signt.pdf The more opaque the fees, the easier it is to bamboozle retail clients. The paper by Brad Barber, Terrance Odean and Lu Zheng concluded that: "..*We report evidence that mutual fund marketing does work. On average, any negative effect of expense fees on fund flows is more than offset when that money is spent on marketing; non-marketing expenses, however, reduce fund flows. Though [front load] load fees are also spent on marketing, the positive effect of marketing on flows does not appear to be sufficient to offset investors growing awareness of and aversion to loads…" While operating expenses (including embedded trailers) constitute a steady drain on a fund's performance, the effect of that drain is masked by the considerable volatility in the returns on mutual funds…"* [We've always found it curious that the fund manufacturer marketing materials and advertisements do not refer to the advice component of the mutual fund value proposition. It is strange because IFIC gives advice such emphasis in their lobbying literature.]

Risks to Customers from Financial Incentives: FSA
http://www.fsa.gov.uk/static/pubs/guidance/gc12-11.pdf [UK FSA] This is an excellent document demonstrating how incentives distort advice. After extensive research the FSA found that:
• Most firms did not properly identify how their incentive schemes might encourage staff to mis-sell. This suggests they had not sufficiently thought about the risks to their customers or had turned a blind eye to them.
• Many firms did not understand their own incentive schemes because they were so complex, making it harder to control them.
• Firms did not have enough information about their incentive schemes to understand and manage the risks.
• Most firms relied too much on routine monitoring, rather than risk-based monitoring, such as performing more checks on staff with high sales volumes.
• Some firms had sales managers with a clear conflict- of- interest that was not properly managed.
• Many firms had links to sales quality1 built into their incentive schemes that were ineffective.
• Some firms had not done enough to control the risk of potential mis-selling in face-to-face situations.
Such results have caused the FSA to essentially ban commissions

Why hasn't indexing taken root in Canada? | Christopher Davis | Fund Investing | Morningstar
"..That's not a problem for Canada's six largest banks, which have successfully used their built-in distribution network of bank branches to sell in-house funds. The banks control an increasingly large slice of long-term mutual fund assets. According to Morningstar data, the banks' combined share rose from 39% at the end of 2011 to 48% by September 2016. (Investors Group, which controls 7% of long-term fund assets, uses a distribution model similar to the banks, selling only funds with its house label through its giant national network of advisors.)..."

Study shows trust for advisors in Canada down

Entitled *From Trust to Loyalty: A Global Survey of What Investors Want*, the survey also showed that in Canada, strong ethics was the most important factor for clients. "Overall, trust globally is up from 50% to 61% so that's the good news," she says. "In Canada, we are still above the global average with 64 per cent, but that is down from the 2013 survey when we were at 76%. Globally the financial markets have done better in that timeframe, while the reverse is true for Canada, so I think that might be the rationale for the change in sentiment." http://www.wealthprofessional.ca/news/study-shows-trust-for-advisors-in-canada-down-208737.aspx and https://www.cfainstitute.org/about/press/release/Pages/02172016_128524.aspx

Fund Fact sheets littered with weaknesses
http://www.theglobeandmail.com/globe-investor/investment-ideas/fund-fact-sheets-littered-with-weaknesses/article625822/ In this piece respected fund analyst Dan Hallett discusses FF deficiencies re risk disclosure . We agree with Dan's observations and also add that we have for the past 4 years been pleading with regulators to spell out Rep/dealer conflicts-of-interest and locate fund fees disclosure ahead of performance on the Fund Facts form. Relocating cost information would give costs more prominence.

Managing conflicts of interest in the financial services industry: ASIC
The paper seems to suggest that extraordinary effort is required to "manage" conflicts but in the end ASIC concludes that if the efforts are expended, ASIC will consider the conflicts "managed" re investor protection. Corporate culture, policies, employee training, oversight and regular audit are required. Maybe better to avoid conflicts of interests altogether.
http://download.asic.gov.au/media/1327370/Conflicts_discussion_paper_April_2006.pdf

Guidance on conflicts of interest for investment advisors: Research
It appears that under a fiduciary or BI advice standard, the "management" of conflicts of interest is extremely difficult. Avoidance may be the only way since disclosure has been shown to be ineffective even detrimental in the retail investor case. We wonder if there is any research that demonstrates conflicts can be satisfactorily managed at the retail investor level.

The High Costs of Canada's Mutual Fund Based Retirement System
David Macdonald **FEBRUARY 25, 2015** Download
Abstract: This study compares the management fees charged by mutual funds and pension plans, and finds that high management fees will cause Canadians relying on mutual funds for their retirement income to work longer or retire with less, compared to those with pension plans. The study recommends an expansion of inexpensive workplace

pension plans or public pension plans, like the CPP; and as a stopgap measure, trailers fees—the portion of mutual fund fees that go back to the advisor—could be capped or banned entirely.https://www.policyalternatives.ca/publications/reports/feeling's-not-mutual

Purse Strings Attached: Towards a Financial Planning Regulatory Framework
.The report reveals that the pace of reform has been slow for an industry entrusted with the retirement security of Canadian consumers. "It's time all employees of the financial planning industry in Canada face the reality-they need to employ a uniform standard of care for investors, complete with a full disclosure of how they're being compensated," notes Jonathan Bishop, co-author of the report. The research reveals Canadian consumers are potentially leaving thousands of their retirement dollars in someone else's hands by conflicts of-interest .The report concluded that the time remains ripe for provincial consumer and finance ministries to work towards a regulatory framework for financial advisors. http://www.piac.ca/wp-content/uploads/2014/11/pursestrings_attached_final_for_oca.pdf

According to a Broadbent Institute study **An Analysis of the Economic Circumstances of Canadian seniors** https://d3n8a8pro7vhmx.cloudfront.net/broadbent/pages/4904/attachments/original/1455216659/An_Analysis_of_the_Economic_Circumstances_of_Canadian_Seniors.pdf?1455216659 a large percentage of older, working Canadians are heading to retirement without adequate savings. Unbiased advice would help reduce the percentage.

A recent study **Old Age and the Decline in Financial Literacy** http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1948627 shows the ability of the elderly to manage their money may decrease after they reach retirement age, but confidence in their ability to make good financial decisions stays the same. The study, found financial literacy declines at a consistent rate after retirement. The ability to answer basic financial questions decreases as respondents age, and this rate of decline almost exactly matches the gradual erosion of memory and problem-solving abilities later in life. This is worrisome because households aged 60 years and older control about half of the wealth in Canada. Since fewer employers provide pensions than ever before, more people are dependent entirely on their retirement savings and that in turn is dependent on trustworthy investment advice.

Protecting Seniors and Their Life Savings: Policies and Practices of Missouri's Investment Firms
A specific policy that ensures account information for senior clients is maintained, regularly reviewed, and updated is a solid approach to avoiding unsuitable recommendations. This information is vital because as investors age, their investment time horizons, and objectives, risk tolerance, family's needs and tax status may change. Liquidity becomes a higher priority, and products that were once a sound investment may no longer be suitable if money is locked up in complicated products where liquidation is possible only after a substantial penalty is paid. These changes in investment needs and goals can be recognized in a timely manner through regular account maintenance and updating.

MFDA sets out regulatory priorities - investmentexecutive.com
" ....In terms of leveraging, it stresses that firms should have policies in place to ensure they meet their leveraging suitability obligations, including criteria for assessing the suitability of a client's use of leverage and describing appropriate circumstances for recommending the use of leverage.
The bulletin also stresses that protecting senior investors is "an area of focus and a strategic initiative" for the MFDA. It says firms should consider certain senior-specific

issues in their supervisory work, including: reviewing new account and KYC paperwork, suitability reviews, marketing and advertising, and the use of business titles specifically directed towards senior investors (to ensure they don't mislead clients). It suggests that firms should consider developing specific procedures to supervise activity with senior investors. Additionally, it notes that dealers are responsible for maintaining policies and procedures to ensure the fair and prompt handling of client complaints, and it sets out what those policies should include. This may be a particular issue for seniors, it suggests, as they may have physical limitations that would make it difficult to submit a formal written complaint; so, it suggests that dealers should be prepared to assist senior clients in documenting their verbal complaints..."

The Changing State of Retirement in Canada – Fidelity (Oct., 2007)
http://m.twmg.net/state_of_retirement_cda.pdf A survey of more than 2200 households shows that Canadians are on track to replace only 50% of their pre-retirement income. To maintain a comfortable lifestyle they may need as much as 80% of pre-retirement income. That's one reason that investing fees and expenses are so important.

Retirement brings new financial challenge
https://secure.globeadvisor.com/servlet/ArticleNews/story/gam/20121127/SRWEALTHMGMTQAMPAATL The investor de-accumulation phase will have a major impact on the advice industry.Drawing down assets in retirement encompasses more than simply ensuring that clients have enough money to cover living expenses and such lifestyle choices as vacations and golf fees each year, but also that clients are not pulling so much out of retirement nest eggs that they are bumping into higher and higher tax brackets. Retirement income planning, covers just how much income people should draw from various sources: tax-deferred, tax-exempt and taxable income accounts. This is true financial planning and is significantly different from transaction based selling of mutual funds. The Regulatory and fund industry implication are self -evident. We're surprised there is so little debate about opening up a supplemental tranche of CPP as an obvious and elegant solution to most retirement concerns being discussed. Securities regulators are not qualified and ill suited to develop retirement incomes policies in Canada. Canadians at large are not willing allocators of capital. It's something they are forced into

doing in the absence of alternatives. Many cost and behavioural finance concerns would be resolved with the CPP option. Flaherty came close to going this route at the PEI first ministers conference but caved to the insurance lobby and we got the stillborn PRPP instead. We stand with Keith Ambachtsheer and Malcolm Hamilton in support of an expanded CPP.

CPP 'economies of scale' make it a cheaper alternative to PRPPs
http://business.financialpost.com/2012/11/27/cpp-economies-of-scale-make-it-a-low-cost-alternative-to-prpps/ "In the final report of the Ontario Expert Commission on Pensions, Professor Harry Authors notes: "I feel obliged to report that a significant number of submissions raised the possibility [of] an expanded or two-tier CPP. I was particularly struck by the fact that this idea was raised in different ways in briefs from stakeholders as disparate as the Canadian Federation of Independent Business and the Canadian Labour Congress.""

Research: Mutual Fund Investors: Sharp Enough?
Who are mutual fund investors? The answer is critical to regulatory policy. The mutual fund industry portrays fund investors as diligent, fairly sophisticated, and guided by professional financial advisors. The SEC paints a more cautious portrait of fund investors, though touts improved disclosure by the fund industry as a sufficient antidote. However, an extensive academic literature finds that fund investors are unaware of the basics of their funds, pay insufficient attention to fund costs, and chase past performance despite little evidence that high past fund returns predict future returns. These findings suggest that policymakers should rethink current regulatory policy. Disclosure may not be enough. http://ideas.repec.org/a/ris/jofitr/0948.html

Research**: Investor behaviour and beliefs: Advisor relationships and investor decision-making study** OSC Investor Education Fund
http://www.getsmarteraboutmoney.ca/en/research/Our-research/Documents/2012%20IEF%20Adviser%20relationships%20and%20investor%20decision-making%20study%20FINAL.pdf ".In summary, advisors are the key influence in investor decision-making. Investors rely upon their advisor for planning and asset mix advice, as well as advice on what specific investments to buy. Other sources of information are secondary to the advisor's opinion. Investors trust their advisor to provide advice that benefits the client first. This trust is underpinned by a belief that their advisor has a legal responsibility to 'put the client's best interest first'. With this as a foundation of investor belief, investors find little reason to be concerned about fees, and perhaps as a result, fewer than half of advisors disclose what they are paid..". Another troublesome finding is that disclosure of trailing commissions declines as the age of the investor increases. Some 40% of 20-39 year olds agree that trailing commissions were disclosed versus 24% for age 40-59 and just 18% for those age 60+. This suggests to us that a seniors vulnerability issue has developed.

Can financial education improve financial literacy and retirement planning?
http://irpp.org/assets/research/faces-of-aging/can-financial-education-improve-financial-literacy-and-retirement-planning/IRPP-Study-no12.pdf ".."Danger lurks, however, when financial education is viewed as a *substitute* for, rather than a *complement* to, these other policies. Willis argues that "[a] society that believes that financial...education will solve consumer financial problems has an all-too-convenient excuse not to engage in the difficult task of finding better...public policies" (2008, 272).This is not to say that developing financial capability is unimportant — innovative efforts to help Canadians understand the need for retirement planning, to avoid the many perils of the financial services market and to take an active part in policy debates should be encouraged. Such efforts are necessary but far from sufficient... "

Pollara Poll IFIC 2016

According to the 2016 Canadian Investors' Perceptions of Mutual Funds and the Mutual Fund Industry, confidence in financial advisors is strong, with 95 per cent of mutual fund investors indicating they can trust their advisor to provide them with sound advice and 88 per cent saying that they get better returns as a result of the advice they receive. Eighty-two per cent credit their advisor with helping them achieve better savings and investment habits, and 91per cent say they get value for the money they pay to their advisor. One-half of investors say retirement funding is their primary motivation for investing in mutual funds and an additional 14% say their mutual funds are intended to augment their income at retirement or later in life. The current market gives consumers choices about how they access and pay for savings products and advice. The Pollara research found that mutual fund investors prefer to have choice when it comes to payment options. Just over half (54%) would prefer to compensate their advisor through bundled fees, while 37% would prefer to pay a direct fee. https://www.ific.ca/wp-content/uploads/2016/09/IFIC-Pollara-Investor-Survey-September-2016.pdf/15057/

Is this the end of the line for trailer fees? Aka commissions**: Vanguard**
" Given how common trailer fees are in the mutual fund industry, any hint that commissions may be limited (or even banned as in the United Kingdom and Australia) naturally raises alarm bells from advisors worried about the impact of any restriction on compensation. Our Vanguard colleagues in the U.K. have reported that the advisors who weathered the commission ban best were those who proactively decided to adjust their practices to thrive and not just survive. Many shifted to a fee-based compensation structure, as Vanguard has advocated in our advisor's alpha framework. Our own recent global survey of advisors found this view was shared by a majority, with 83% of Canadian advisors surveyed indicating a fee-based model was better for their practices than a commission-based model, as the illustration shows."

Trailer commissions not the only way advice is skewed.

UK FCA suggests reforms that would make financial advice and guidance work better for smaller investors http://www.fca.org.uk/news/reforms-will-make-financial-advice-and-guidance-workbetter-for-consumers Some of the ideas would work well in Canada too and should be considered by the CSA/Government.

Why it's hard to hope for mutual fund fee reform
http://www.globeinvestor.com/servlet/ArticleNews/story/GAM/20170203/RBGISTRATLABHALLAM

It's time to ban embedded fees - Investment Executive
"...One of the biggest beneficiaries of such a move is likely to be independent advisors. For too long, advice has been devalued by embedded compensation, which distorts the market for advice and undermines advisors' value to clients. Trailer fees work well for the investment fund companies and for dealers because trailers serve as a powerful incentive to accumulate assets - but these fees don't reward superior advice to clients and don't allow high-quality advisors to distinguish themselves. That's why advisors should embrace the CSA proposal to eliminate embedded compensation as a once-in-a-lifetime opportunity to shed a system that devalues their service, deters them from developing into genuine professionals and often compels them to be simply salespeople..."

The Market for Conflicted Advice by Briana Chang, Martin Szydlowski: SSRN
Abstract: We study decentralized markets in which advisers have conflicts of interest and compete for customers via information provision. We show that competition partially disciplines conflicted advisers. The equilibrium features information dispersion and sorting of heterogeneous customers and advisers: advisers with expertise in more information sensitive assets attract less informed customers, provide worse information, and earn higher profits. We further apply our framework to the market for financial advice and establish new insights: it is the underlying distribution of financial literacy that determines the consumers' welfare. When advisers are scarce, the fee structure of advisers is irrelevant for the welfare of consumers.

Fund Stewardship Matters: Morningstar Research Shows Link Between Good Stewardship and Strong Performance
Morningstar evaluated the 27 Canadian fund providers to which Morningstar analysts had assigned a 2010 Stewardship Grade. The group includes both large and smaller providers, and represents approximately 75 percent of the industry's assets and 1,500 distinct funds. Among this group, Morningstar analysts assigned five firms a Stewardship Grade of "A," six firms received a "B," 15 firms received a "C," and one firm received a "D." Overall, Morningstar found that fund companies with higher Stewardship Grades had better-performing funds during the study period, as measured by their Morningstar Success Ratios.http://www.prnewswire.com/news-releases/fund-stewardship-matters-morningstar-research-shows-link-between-good-stewardship-and-strong-performance-for-canadian-fund-companies-277431651.html

Carl Richards: **Six Things the Investment Industry Can Do to Change the World |** CFA Institute Annual The “behavior gap,” he said, comes from measuring time-weighted versus dollar-weighted rates of return. “Most of the money in a mutual fund is advised; it gets there because an adviser put it there. So if there is a big difference between the time-weighted and dollar-weighted rate of return on mutual funds, and most of the money is advised, we are part of the problem,” he said. “We are constantly creating new products. It is easy to sell to clients what they want, but it takes a bit more to have them purchase what they need, and often we are facilitating this mess we have created. Our industry has to be one of the most opaque industries in the world. Nobody really knows what they pay. It’s really hard to even figure it out.”

It’s Time to Ban Advisor Commissions | Canadian Couch Potato on Advocis position
With an investment advisor, the situation is completely different. Selecting appropriate funds for the client is (or should be) a fraction of the overall service. An advisor’s time is spent primarily on goal planning, risk assessment, tax planning, portfolio maintenance, behaviour management and a host of other ongoing services. None of that has anything to do with financial products. So why should a professional advisor be compensated primarily by mutual fund commissions?
http://canadiancouchpotato.com/2013/06/13/its-time-to-ban-advisor-commissions/

Anxiety, Advice, and the Ability to Discern: Feeling Anxious Motivates Individuals to Seek and Use Advice
Across 8 experiments, the influence of anxiety on advice seeking and advice taking is described. Anxious individuals are found to be more likely to seek and rely on advice than are those in a neutral emotional state (Experiment 1), but this pattern of results does not generalize to other negatively valenced emotions (Experiment 2). The relationships between anxiety and advice seeking and anxiety and advice taking are mediated by self-confidence; anxiety lowers self-confidence, which increases advice seeking and reliance upon advice (Experiment 3). Although anxiety also impairs information processing, impaired information processing does not mediate the relationship between anxiety and advice taking (Experiment 4). Finally, anxious individuals are found to fail to discriminate between good and bad advice (Experiments 5a–5c), and between advice from advisors with and without a conflict of interest (Experiment 6).

The Gamma Factor and the Value of Financial Advice: CIRANO
This study, based on a new Canadian survey and adjusting for the causality issue, reconfirms the positive value of having financial advice. As in our earlier paper, the discipline imposed by a financial advisor on households' financial behaviour and increased savings of advised households are key to improving asset values of households relative to comparable households without an advisor. Benefitting from a subset of participants in both surveys, dropping an advisor between 2010 and 2014 was costly: those households lost a significant percentage of their asset values while the households who kept their advisor have gained in asset values.

Financial Advice: Does it Make a Difference? by Michael S. Finke:: SSRN
Abstract: The financial advice profession provides a potentially valuable service to consumers within an increasingly complex financial marketplace. Financial advice professionals can substitute for costly investment in financial knowledge by households. This paper provides evidence that financial advisers improve financial outcomes when the

interests of the advisor and household are aligned. However, professional advice can harm consumers if conflicts of interest create high agency costs. Understanding how differences in compensation methods and regulatory frameworks affect incentives is essential to improving the breadth and quality of professional advice.
https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2051382

OSC Annual Report-Dealers / Advisors A recent OSC report airs concerns over advice to seniors. The Report states:
"Through recent compliance reviews or investor complaints, CRR and the Investor Office, have detected concerns related to the provision of investment advisory services or sales of products to vulnerable investors; in particular, senior investors, but also investors with other vulnerabilities (e.g. a diminished cognitive capacity, a severe or long term illness, a physical disability, mental health problems, a language barrier). Senior investors, especially those who may have diminished capacity, are vulnerable to investment advice that is unsuitable, investment fraud and financial abuse. OSC staff is concerned with issues related to senior investors because: ☐ they are growing as a demographic, both in terms of population and also in terms of household investable assets, ☐ they are relying on investments to fund retirement costs, and in some instances agreeing to invest in high-risk products to generate a desired level of income, and they may have a reduced investment time horizon to recover from financial losses, ☐ they may not understand the risks and investment features of the product they have invested in. We are prepared to take serious regulatory action when we find unsuitable investments."

In Defense Of Mutual Fund DSC Fees For Smaller Investors
http://www.moneysmartsblog.com/defense-mutual-fund-dsc-fees-investors/

Commission-based clients may not want to switch A new JD Power report on US investors' reaction to the conflict-of-interest rule advanced by the Department of Labor (DOL) has found that investors currently paying commissions do not want to switch to fee-based payment in their retirement accounts, according to Financial Advisor IQ. Under the DOL's fiduciary rule, financial advisors have to always act in their clients' best interests when servicing retirement accounts. The rule also requires for retirement account-holders to be charged fees on a percentage of assets under management instead of on a per-trade or commission basis. While fee-based compensation can motivate advisors to grow their clients' assets, fees can be more expensive than commissions. Responding to a question about their willingness to switch to fees, only 8% of commission-paying investors favour the switch, and another 33% say they probably will. Forty percent are leaning toward disagreement, while 19% are adamant in refusing. http://www.wealthprofessional.ca/news/commissionbased-clients-may-not-want-to-switch-222906.aspx and https://financialadvisoriq.com/c/1590253/182213

Embedded Commissions Article - An Important Read | Advocis Calgary
At the crux of the compensation debate in Canada is the desire to see the consumer properly advised and properly protected. If consumer protection is the real issue for regulators, why not start with increasing advisor professionalism? Consumers would benefit tremendously from a requirement that their advisor meet ongoing proficiency standards, satisfy continuing education requirements, and adhere to a code of professional and ethical conduct that ensures the client's interest is always put first. With this approach, consumers are better protected by knowing their advisor is held to a higher standard — not by having their freedom to choose how they pay for advice taken from them. http://www.advociscalgary.ca/embedded-commissions

Re: CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Conflicted Compensation

Harold Geller and MBC Law Professional Corporation are pleased to comment on the Canadian Securities Administrators ("CSA") consultation paper 81-408 – Consultation on the Option of Discontinuing Conflicted Compensation ("Reform Proposal"). Consultation paper 81-408 is an important part of the overall CSA review of the conflicts of interests which harm Canadian investors and impair market efficiency.

The Reform Proposal, on its own, is an essential effort to resolve the overall problem whereby investors' interests are in conflict with the self-interest of advisers and their dealers (hereinafter collectively referred to as "Salespeople"). This conflict of interest is not one that is resolvable through disclosure, or in the case of CRM2, partial disclosure of the conflicts. The CSA Reform Proposal is a welcome and overdue step towards providing protection to investors from unfair, improper and abusive practices which harm investors and undermine the integrity of Canadian capital markets.

The following comments are limited to those issues of interest to the individual retail investor only. In summary, it is our opinion that:

1. The overriding issue is the conflicts of interest inherent in the current conflicted compensation model used for the sale of investment products. These inherent conflicts of interest routinely result in the interests of the investor being subordinated to the interests of those selling the investment products. Salespeople have far greater knowledge of capital markets than do their retail clients. This creates significant reliance by the investor on Salespeople, which reliance leads to vulnerability in many cases. Salespeople have the opportunity to exploit this vulnerability when acting in a conflict of interest.

2. This conflict is long-standing.

3. The industry has failed to resolve this issue on its own.

4. Regulatory steps are required to align the interests of Salespeople with that of investors.

We agree with the presentation of the issues as described in Part 1 – these conflicts are well known and the issues are appropriately summarized.

The industry has failed to remedy the conflicts arising from conflicted compensation either by requiring greater proficiency or managing the conflicts by avoiding biased compensation models. Examples include the spreads on fees paid for sales which incent salesperson to sell of particular products or, in particular, proprietary, inferior performing, and higher risk products. Given this failure, action is needed.

Will investors pay for advice?

Salespeople and manufacturers allege that investors will not pay for advice. There is no empirical evidence presented to support this contention. This paternalistic argument (that Salespeople know what is best for the investor) comes from the industry, a conflicted interest group. Further, this argument undermines the counterproposal, rejected in the Reform Proposal, that disclosure by itself will remedy the conflict.

Salespeople claim on one hand that the investor is capable of appreciating the nuance of the complex disclosure post-CRM2, yet deny that the investor will continue to invest if clearer disclosure of true costs and market-distorting incentives is required. "Mass-market" and "mid-market" clients (i.e. smaller accounts) are less likely to have the sophistication necessary to appreciate the significance of the disclosures. As the Reform Proposal makes clear,[1] 88% of all households that owned investment funds in 2012 were in these two categories.

At the same time, there is no empirical evidence of which we are aware that investors will not pay for advice. Indeed, this argument is self-defeating. Investors have always paid for advice one way or another. Salespeople argue that clients should pay without knowing, because if they knew they would act differently (see the Direct Pay discussion below). The Reform Proposal merely requires that investors know what they pay for advice.

There is no social scientific study to show what clients will do if conflicted compensation is banned. As the Reform Proposal states,[2] the Canadian experience is unique. Salespeople, their lobby groups and manufacturers, often refer to sales surveys as evidence that no change is necessary or, alternatively, change is harmful. Survey results conducted by industry players require careful examination of their construction and implementation. Consider the analogy of the rigorous oversight by regulators of drug trials conducted by pharmaceutical companies.

Studies referenced by the CSA reveal that investors who receive conflicted advice have worse outcomes than those with non-conflicted advice. This is true regardless of how the regulators move towards transparent disclosure of the costs of advice. This motivated Salespeople to resist the introduction of CRM2's mandatory disclosure of costs. Essentially, the industry does not want to be accountable for the services it renders to its clients.

There appears to be no relationship between advice and fees charged. As noted in the Reform Proposal, DIY investors get no advice from discount brokers, yet often pay the same fees as other investors.[3]

Impact of the Reform Proposal

---

[1] At pages 26 et seq. Table 2.
[2] At page 6.
[3] At page 51, at page 51.

Once informed of the true cost of their investments, investors may choose to cease relationships with product-driven Salespeople. This is predicted by the Reform Proposal.[4] Indeed, one impact may be that investors switch to holistic planners in place of product Salespeople. To distinguish themselves from others with a similar shelf of products, Salespeople often promote their holistic planning services ("We provide peace of mind." "We act in your best interest.") In other words, they sell planning advice. None advertise that they sell better products. ("Our stocks are better than theirs.") Even proprietary products often closely resemble products sold by competitors (at a lower price). In any event, there is no downside risk to investors being better informed of the true cost of advice or in the elimination of the temptations posed by a conflicting compensation model.

What compensation should be covered

The Reform Proposal suggests elimination of all payments to Salespeople to incent sales of specific products. As the proposal suggests, the issue is the distortion of advice as a result of conflicted incentives. All compensation should be captured. For example, underwriting compensation, referral fees and other sales incentive sweeteners have long been known to result directly in increased sales and more favourable recommendations by Salespeople. The retail investing public is entitled to bias-free advice. Most retail investors cannot appreciate the bias created by the conflicts and what that means for the advice. Disclosure cannot overcome this deficit. Consider the "best interests" debate, where a product is "suitable" for a client, but rewards the Salesperson more than a better (for the client) product available. Salespeople will usually sell the inferior product if incentives reward this.

Exempt products

There is no policy-based fairness principle to exclude exempt products from the Reform Proposal, whether they be structured notes or insurance products (segregated funds). Regulatory arbitrage is a bane of the present system. Our office has seen many cases in which insurances licensees sell exempt products with high compensation to them that are easily replicated at far lower cost by non-exempt investment funds. This arbitrage opportunity rewards conflicted sales recommendations.

Integrated Salespeople

The Reform Proposal observes that integrated dealers make up more than 80% of the investment fund market for retail investors.[5] This is more significant for more vulnerable investors (mass-market and mid-market), who rely on their bank branches to recommend proprietary products from a very restricted shelf. The Reform Proposal must capture internal transfer payments or the integrated dealers will circumvent the Reform Proposal, at risk to the most vulnerable clients. The recent furore raised by the CBC's investigation into bank practices,

[4] In the "Impact" analysis at pages 62 *et seq.*
[5] At page 30 *et seq.*, Tables 5-8

highlights the urgency felt by the public.[6] This must be a broadly based ban to avoid workarounds in Salesperson distribution and compensation models.

Payment options – automatic pay

Any limited permission for payment by the investor from assets held with the Salespeople, requires considerable study. Notionally, this facilitates the investor paying for advice. In reality, there is great risk of this being a backdoor equivalent of conflicted compensation. Many investors, especially in mass-market and mid-market households, lack the financial experience to read and appreciate their periodic statements. They routinely sign forms presented by trusted advisers without reading them – as do we all.
While this mechanism may have merit, the CSA should consider carefully how to permit this option without risking the very harm that the Reform Proposal targets. The Reform Proposal discusses "reverse churning", where a "buy and hold" investor is charged a percentage fee.[7] With automatic pay, there is no bill to pay, no "aha" moment in which the client asks whether the advice is worth the cost and then comparison shops.

Payment options - direct pay

The Reform Proposal also refers to the "direct pay model" where the client writes a cheque for the advice. The industry argues that this raises a major risk. They contend that retail clients who do not pay for advice will not get advice, to their detriment. Direct pay raises the risk that clients will not value the advice as much as its cost. Automatic pay raises the risk that clients will not appreciate that they are paying for the advice, as is often the case with investment fund trailer fees. Which is better? Full, mandatory disclosure or the risk of no disclosure? CRM2 answered this question. Direct pay merely reinforces the CRM2 policy.

There is some evidence that the only benefit to investors of working with a Salesperson is the encouragement to save for retirement. This evidence focuses on the value of planning advice as opposed to product sales. In fact, few investors who invest with self-described financial planners receive financial planning. Most of those who do receive any financial planning, receive template plans which are better described as sales pitches.

Financial planning vs. Product sales

In the conflicted compensation model, the value of advice is disconnected from the sale of a product. The two most important components of financial planning are: pay down debt, and save money. Neither is part of a product sales strategy. Indeed, conflicted compensation encourages asset-gathering strategies through deferral of debt repayment, leverage loans/margin investing and commutation of pensions. These are the antithesis of financial planning, yet are strategies commonly promoted by self-described financial planners. Financial planning and the sale of products can be irreconcilable objectives.

---

[6] http://www.cbc.ca/news/business/bank-s-deceptive-titles-put-investments-at-risk-1.4044702
[7] At page 65, and footnote 127.

The Reform Proposal should encourage Salespeople to offer and provide conflict-free, financial planning in the best interest of their clients. Direct pay supports this.

The advice gap

The Reform Proposal defines the "advice gap" as being "investors who cannot obtain the amount of advice they desire at the price they are willing to pay", an access to service issue.[8] We agree that this is an issue, but we submit that there is a far greater issue facing retail investors in all the markets identified by the CSA, from mass-market to affluent. This is the mismatch between what clients think they are buying (financial planning) and what they receive (sales promotion).

The Reform Proposal should alleviate the real advice gap.

1. The advice gap is not, as salespeople claim, related to the lack of advisors, but the lack of proficiency among advisors. Investors suffer when conflicted advisors provide conflicted planning advice which is, at its heart, sales recommendations.

2. As the UK experience has shown, many non-proficient and conflicted advisors will not continue to offer services when a fair playing field is offered to the investor. This is a positive outcome that narrows the advice gap. The advice gap is inherent in a product sales compensation model. Planning advice is the key to successful investor outcomes, not product sales.

3. Incenting the advisory relationship and de-incenting the sales relationship will directly lessen the advice gap. Consider that advisors usually promote return on investment as the key metric. Clients want to accumulate savings. Returns are only one component of a successful client experience. Returns should not be earned at risk to the client's outcome, unless there is full disclosure in plain language without bias.

4. The value of advice will become clearer when the full cost of advice is transparent. This is a major problem with CRM2 which requires opaque disclosure of the payments to the advisor without clear disclosure of the other conflicted compensation. Thus, this failure of CRM2 will be addressed with the removal of conflicted compensation.

As noted in the conflicted compensation, Salespeople and manufacturers of lesser quality products have little incentive to act in the best interest of investors. Disclosure of compensation removes this anti-market efficiency behaviour.

[8] Page 62 *et seq.*

Predicting the impact of the Reform Proposal

The Reform Proposal makes predictions.[9] These appear to be reasonable. A freer market should respond with new and improved models. Disruption will occur and creative models will emerge. A great hope in this regard is Canadian versions of Fintech. Regardless of fear mongering, the industry will prosper.
The removal of conflicted compensation is good for compensation of professional financial planners. Instead of a front-end payment for sale, clients should pay for planning and advice as services are rendered. Thus, good client behaviour (spend less, save more, pay debt) will replace poor client behaviour (maintain and even increase debt and purchasing high fee products) driven by variable, disproportionately upfront sales compensation. This different model aligns the work of good advisors with their compensation.

Further, the best outcome for clients is the professionalization of Salespeople. Proficiency and professionalism should replace sales. This is good for those advisors who provide advice of good and excellent quality. It will push out those that are merely interested in sales (churning), and support those who put the best interests of clients first.

Conclusion

The Reform Proposals are a necessary and important step towards aligning the interest of Salespeople with that of their investor clients. This alignment will address the present advice gap. This alignment will remove incentives that harm both investors and market efficiency. The CSA proposal is timely and necessary.

Yours very truly,

Harold Geller

I thank you for taking the time to read this submission regarding embedded commissions.

I feel that it is far beneath the services of a profession to be discussing whether or not fees, costs or commissions should be revealed, hidden or any other clever deviation or variation.

It is becoming increasingly common knowledge among Canadians, that there is a massive amount of commission (or fee hungry) salespersons, who do a very good job of concealing the essential elements of the relationship to the people they claim to serve.

This makes an industry which should be based upon trust, appear tainted and predatory, and it will eventually make the regulators appear to be 'helpful' in the predation.

Nothing but self-serving, unprofessional behaviour contrary to the public interest, would result from letting firms continue to play the game of hide and seek on how they are paid.

"The ability to hide or conceal charges in a financial industry is needed only as a selfish and shady method by which to “place obstacles before the blind”, or hide information and truths from the vulnerable clients that this industry purports to serve.”

We now know better than this, and when we know better, it then becomes incumbent that we do better.

Objet : **La position du Conseil des représentants du Réseau SFL, concernant le projet d'abolition des commissions intégrées au Canada.**

Nota Bene
Dans le présent document, le genre masculin est utilisé à titre épicène dans le but d'alléger le texte. Également, les termes représentants, conseillers, planificateurs sont synonymes. Il existe plusieurs réseaux de distribution au Canada, similaires au Réseau SFL.

Maître,

La présente est pour vous transmettre l'opinion des conseillers du Réseau SFL, reconnus comme **des entrepreneurs autonomes ou constitués en cabinet.**

Nous avons pris connaissance du contenu des trente-six questions soumises à titre de guide d'intervention pour présenter notre opinion. Nous avons fait le choix de ne pas y répondre telles que suggérées puisque plusieurs d'entre elles nous semblent tout à fait inappropriées et risqueraient plutôt de nous mener ailleurs que ce que nous désirons vous partager aujourd'hui.

Quelques faits

Depuis plus de 25 ans, l'industrie des fonds communs de placement a connu une croissance fulgurante, contribuant grandement à l'enrichissement des épargnants canadiens.

La consultation générale initiée par les ACVM, qui a mené à la production du document 33-404, a identifié quelques problématiques quant aux sources potentielles de conflits d'intérêt, s'il en est. À cet effet, une grande banque canadienne a tout récemment été mise en vedette dans tous les médias suite à des allégations provenant d'anciens employés. À ce jour, aucune accusation n'a été portée.

Cependant, les commentaires d'une centaine d'employés alimentent grandement les doutes auprès des consommateurs en général. D'ailleurs, lors d'émissions spécialisées à la télé, il a déjà été mentionné que des grandes banques semblaient exercer une certaine pression sur leurs employés afin qu'ils effectuent le plus possible de ventes croisées, tout en favorisant l'offre répétée de produits "maison" auprès de leurs clients. Ces démarches sont-elles initiées dans le meilleur intérêt de leurs clients? On peut se poser la question.

Malgré les risques liés à ce genre de pratique, les ACVM ont plutôt décidé de s'attaquer aux commissions intégrées (81-408) en voulant les éliminer et par conséquent, de menacer l'existence même du conseiller indépendant. Est-ce la meilleure façon de reconnaître la valeur ajoutée de celui-ci? Permettez-nous d'en douter!

SFL et ses conseillers «entrepreneurs»

Cette bannière de distribution en services financiers est présente et en pleine croissance partout au Canada. SFL est reconnu comme un important courtier qui n'offre aucun produit maison en épargne collective.

Les conseillers indépendants, dont ceux du Réseau SFL, sont des entrepreneurs au sens réel du mot. Ils ne reçoivent aucun salaire mais plutôt une rémunération sous forme de commissions ou d'honoraires. De plus, ils sont reconnus comme ayant largement contribué à l'essor de cette industrie et ainsi d'avoir permis à des milliers de canadiens, de petits et grands investisseurs, d'atteindre leurs objectifs d'épargne.

À cet effet, une étude récente le démontre clairement :

> ***« La discipline imposée par un conseiller sur les habitudes financières de ménages et leur taux d'épargne supérieur sont les clés qui mènent à l'amélioration de la valeur de ces ménages lorsque comparés aux ménages sans conseiller »***[1]

Les conseillers SFL offrent à leurs clientèles une gamme complète de produits et de services professionnels.

[1] *Centre interuniversitaire de recherche en analyse des organisations (https://www.cirano.qc.ca/files/publications/2016s-35.pdf)*

Au fils des ans, leur offre de services s'est raffinée afin de mieux répondre aux besoins de leurs clients. La qualité de leurs conseils et leur accompagnement auprès de leur clientèle deviennent une valeur ajoutée qui augmentera le taux de réalisation des objectifs financiers de leurs clients.

Le conseiller SFL n'a aucune obligation quant au choix de ses fournisseurs. Il n'a aucune contrainte quant aux choix des produits qu'il offre. Et sa plus grande préoccupation sera de respecter les cibles de réussite et l'intérêt de son client. Évidemment, il ne subit aucune pression de vendre tel ou tel produit puisqu'il a le choix entre une gamme de produits non restrictifs. Il est important de rappeler que le conseiller SFL est un entrepreneur indépendant et n'offre pas de produits maison en épargne collective.

Son seul actif est sa clientèle. C'est avec la qualité de ses conseils, de son service et des produits offerts qu'il réussira à **construire, à satisfaire et à conserver** sa clientèle.

Tel que mentionné, tous les conseillers indépendants sont des entrepreneurs. Ils prennent des risques d'affaires et doivent aussi débourser d'importants frais dans l'élaboration et le maintien de leurs affaires.

Voici quelques exemples des frais déboursés sous leur responsabilité :

- Frais de déplacement
- Permis
- Perfectionnement
- Assurance responsabilité
- Comptable et autres frais professionnels inhérents
- Équipement de bureau
- Formation continue
- Loyer
- Personnel administratif
- Prospection
- Représentation, promotion, marketing

Il est raisonnable d'affirmer que les dépenses engendrées par un conseiller indépendant pour le maintien de sa profession se situent entre 25% et 35% de ses revenus. L'acquisition de clientèle peut également faire augmenter ces coûts considérablement.

On comprendra que la situation est totalement différente dans une institution de type bancaire qui assume tous les frais cléricaux et qui rémunère ses employés à salaire.

De plus, les conseillers indépendants procurent de nombreux emplois, directs et indirects, partout au Canada.

Le conseiller peut, tout comme celui du Réseau SFL, faire l'objet de vérifications de la part des autorités réglementaires. Ses activités sont encadrées par la Chambre de la Sécurité Financière.

Depuis plusieurs années, les conseillers indépendants ont des obligations de plus en plus importantes en matière de conformité, de formation et de professionnalisme. Nous convenons tous du bien-fondé de la rigueur que ces dernières apporteront à notre profession, au bénéfice de nos clients.

Ces obligations assurent une qualité accrue en ce qui a trait à la valeur des conseils donnés. Il est largement démontré et prouvé que les clients qui bénéficient de conseils de leurs conseillers réussissent mieux que ceux qui n'en ont pas.[2]

Le mode de rémunération actuel est composé de quatre éléments : de commissions provenant de ventes avec frais différés, avec frais réduits ou sans frais, ou encore d'honoraires. En tout temps, le conseiller peut être rémunéré en fonction des objectifs et de l'horizon temporel de son client.

De ce fait, le conseiller s'assurera que son client possède tous les éléments en main pour atteindre sa sécurité financière sans payer de frais additionnels.

Les enjeux

Nous savons tous que les ACVM ont entrepris une vaste consultation sur l'option d'abandonner les commissions intégrées.

Les conseillers SFL, comme tous les autres conseillers indépendants, s'interrogent sur les objectifs qui motivent et guident les ACVM au pays. Aux dires même des représentants de l'AMF au Québec, il semble que toute cette démarche émane de seulement quelques groupes de pressions dont «Fair Canada». Qui est Fair Canada? Qui finance ces organismes? Quels sont les intérêts recherchés par ceux qui financent?

Les conseillers vous confirmeront qu'en aucun temps les clients informés se plaignent de la rémunération de leur conseiller. Ils savent reconnaître la qualité du service et la valeur du conseil.

Trois enjeux (ou plutôt affirmations) sont soulevés dans le document de consultation 81-408 en prétextant que les buts recherchés dans cette démarche sont d'abord la protection des investisseurs et ensuite, l'efficience des marchés.

Ces enjeux sont :

1. Les commissions intégrées pourraient donner lieu à des conflits d'intérêts;
2. La compréhension des coûts réels pourrait être difficile pour les investisseurs;
3. Les commissions intégrées pourraient ne pas convenir aux services fournis par le représentant;

[2] Voir https://www.ific.ca/fr/policy_topics/value-of-advice/

Même si le document de consultation 81-408 explique clairement qu'aucune décision ne semble prise, la lecture de ses 182 pages nous laisse manifestement croire qu'au contraire, la décision d'abolir les commissions intégrées semble apparaître comme l'unique piste de solution pour les ACVM.

Nous nous expliquons mal les raisons qui motivent les ACVM à orienter voire même diriger les discussions sur cette voie. Nous sommes d'avis que l'orientation actuelle de la réflexion adoptée par les AVCM pour améliorer le sort des investisseurs n'est vraiment pas l'avenue à privilégier.

Voyons ces trois enjeux plus en détail, savoir :

1. **Les commissions intégrées pourraient donner lieu à des conflits d'intérêt;**

Au niveau des fonds mutuels, il y a lieu de rappeler que les commissions sont très similaires d'un manufacturier à l'autre, voir identiques dans bien des cas.

Les clients voient la valeur ajoutée qu'ils obtiennent et comprennent la réalité économique du conseiller entrepreneur.

À l'inverse, ils comprennent aussi que cette réalité ne s'applique pas au domaine bancaire. L'offre de service est différente, tout comme les produits offerts et l'indépendance des conseils.

En définitive, différentes options sont offertes aux clients et ces derniers peuvent facilement choisir ce qui leur convient le mieux.

Pour nous, le vrai conflit d'intérêt se révèle lorsqu'un ¨conseiller-salarié¨ a l'obligation de vendre le produit que son institution-employeur lui oblige de présenter à la clientèle qui lui a été confiée en contrepartie du salaire reçu comme employé. Par ailleurs, on pourra convenir que vendre un produit qui pourrait répondre au profil d'investisseur d'un client est une chose, mais recommander le meilleur produit parmi les quelques 6 000 options possibles en est une autre.

Décidément, un fait semble très clair pour nos clients:
<u>l'indépendance de leur conseiller leur procure assurément la meilleure garantie contre les conflits d'intérêts potentiels</u>.

Compte tenu de la réalité entrepreneuriale du conseiller indépendant, il est impossible de penser qu'un mode de rémunération unique à honoraires pourrait s'avérer ¨rentable¨ dans tous les cas. Ce faisant, un nombre important de clients pourrait devenir privés de recevoir des conseils judicieux et indépendants, et pouvoir se procurer de bons produits.

En coûte-t-il vraiment moins cher pour le client d'avoir un compte à honoraires plutôt qu'un compte à frais réduits? Un compte sans frais ou un compte à frais différés? À titre de professionnel dans la distribution des services financiers, nous croyons et affirmons que NON.

Lors d'une récente rencontre de monsieur Mathieu Simard de l'AMF (le 21 février 2017) à nos bureaux, il lui fut démontré qu'en remplaçant la rémunération actuelle d'un conseiller indépendant par une rémunération à honoraires, un très fort pourcentage de clients (évidemment les plus petits) seraient abandonnés par le conseiller, faute de pouvoir être rémunéré décemment pour continuer à les servir de façon professionnelle.

2. La compréhension des coûts réels pourrait être difficile pour les investisseurs;

Il est peut-être vrai qu'avant le MRCC2, le ratio de frais de gestion (RFG) et, par le fait même, les commissions intégrées pouvaient ne pas être facilement compréhensibles par le client. Cela étant dit, il est maintenant obligatoire d'en discuter et le fait que les frais et commissions soient divulgués sur les relevés annuels nous semble la meilleure garantie pour le client que le conseiller expliquera la ventilation des frais.

Cependant, nous croyons qu'il est beaucoup trop tôt pour évaluer les résultats de l'implantation du MRCC2. Il serait avisé et sage de patienter quelques années pour en mesurer les effets réels.

Contrairement aux nuances subjectives exprimées dans le document 91-408, la rémunération versée aux conseillers n'a jamais nuit à l'enrichissement des clients.

L'expérience vécue dans d'autres pays a clairement démontré, hors de tout doute, qu'une proportion importante de clients subissent les effets négatifs conséquemment à des décisions semblables à celles que semblent vouloir prendre les ACVM au Canada.

Pour nous, il y a deux façons de voir les choses :

- On peut penser faire mieux qu'ailleurs!
- On peut aussi éviter les erreurs commises ailleurs!

On sait maintenant que certains pays, dont le Royaume-Uni, qui ont aboli les commissions intégrées sont à rechercher présentement des moyens pour relancer l'industrie et à s'assurer que les épargnants ¨qui ont été mis de côté¨ puissent obtenir ¨à nouveau¨ des conseils judicieux et des services professionnels.

3. Les commissions intégrées pourraient ne pas convenir aux services fournis par le représentant;

Sur ce point, il y a probablement des éléments qui méritent discussion. Il faut se rappeler que les courtiers recommandent à leurs conseillers de respecter les règles de la conformité édictée par l'AMF. Par conséquent, les conseillers revoient périodiquement leurs clients et se doivent de compléter ce qu'on appelle un CVC (Connaitre Votre Client), et ainsi mettre à jour les objectifs et les informations propres à chaque client.

Alors, sans être parfaite, on peut tout de même affirmer que cette pratique d'affaire assure un suivi certain après de toute la clientèle par les conseillers et pour les courtiers, que des conseils ont effectivement été prodigués.

Cependant, nous sommes toutefois d'avis que les clients sont assez avisés pour juger de la qualité du niveau des services reçus versus ce qu'ils désirent recevoir, et que la rémunération touchée par le conseiller soit à la hauteur de leur degré de satisfaction. Les clients ont donc toujours le choix d'exprimer leur satisfaction ou leur insatisfaction en conservant ou en changeant de conseiller.

Conclusion

Le Conseil des représentants du Réseau SFL est d'avis que tout changement au mode de rémunération présentement offert aux conseillers indépendants, mettra sérieusement en péril la pérennité de l'industrie. Ne pouvant pas obtenir ou trop peu de rémunération en échange de leurs conseils auprès des clients à plus faible volume d'actifs**,** plusieurs conseillers auront le réflexe de se désengager de la profession et ce, sans compter les risques que le recrutement de nouveaux conseillers devienne à plat. C'est pourquoi, **plusieurs investisseurs** (les plus petits qui ne comprendront pas la nécessité de verser des honoraires pour obtenir des conseils) **risqueront donc de se retrouver sans conseillers pour bien les guider.**

Par conséquent, toute cette approche risque grandement de compromettre la valeur ajoutée de tout le travail accompli dans l'industrie depuis plusieurs décennies. **Nous répétons notre conviction qu'il n'y aurait plus moyen d'assurer une relève chez les conseillers indépendants.**

Dans le document de 182 pages de 81-408, on fait allusion aux FNB. Pourquoi? Les gens sont libres d'en acheter ou de choisir les conseils d'un conseiller. Ces produits peuvent être très volatils en période de baisse. Par ailleurs, il a été démontré clairement que de bons fonds mutuels procurent des alphas supérieurs aux indices mais surtout, ceux-ci donnent accès aux conseils.

En fait, il existe une foule de produits sur le marché. Certains paient des commissions ou des honoraires et d'autres, pas du tout. Les clients peuvent aussi gérer eux-mêmes leurs actifs, ou faire affaires avec de grandes institutions ou encore travailler avec des conseillers indépendants.

Donc, les clients «s'appartiennent». Alors, de grâce, ¨**LAISSONS-LEUR LE CHOIX**!¨

Nous pouvons convenir que c'est le privilège du client de pouvoir choisir avec qui il veut travailler pour planifier adéquatement son avenir financier; il a aussi le même privilège de pouvoir souscrire le produit qui pourra lui convenir pour atteindre ses objectifs.

La situation au Canada, depuis les vingt-cinq dernières années, ressemble davantage à un succès qu'à un échec. Elle a permis l'enrichissement de millions de baby-boomers. À consulter le presse d'affaires, cela ne semble pas le cas au Royaume-Uni présentement!

Nous espérons que, tout comme nous, vous prendrez très sérieusement en considération la présente et que vous verrez à améliorer et à faire avancer la profession… plutôt qu'à l'éliminer à court et moyen terme. Nous sommes d'avis que le dialogue s'impose

Au nom du conseil des représentants du réseau SFL pour le Québec, veuillez agréer, Maître, l'expression de nos salutations distinguées.

I am a retired senior who has felt the bitter sting of conflicted sales advice of mutual funds. It was a life altering experience I would not wish on anyone.

Anyone presenting themselves as an advisor should not be collecting hidden sales commissions from the company recommended. It would be like a doctor getting paid under the table to prescribe a certain drug that was more expensive than others available or worse, wasn't needed at all.

These so-called embedded commissions can also lead to other bad advice like borrowing to invest. The more in embedded commissions a salesperson makes in trailers while at the same time putting the investor at greater risk. The situation is even worse when the salesperson gets a commission for referring a trusting client to a lending institution. These referral arrangements should be outright banned.

I highly recommend that the CSA ban embedded commissions and at the same time require that "advisors" put the client's interests above their own commercial interest, otherwise it is a conflict of interest.

Canadians depend on "trusted" advice to manage their nest eggs for retirement but the current system is Caveat Emptor.

At the same time I urge the CSA to give the Ombudsman for Investments binding authority for its recommendations of the national ombudsman.

I sincerely hope this feedback is useful to the CSA.

It is fine to post my comments publicly as I would like others to be aware of the dangers of the current system of conflicted advice.

Sincerely,

Mildred Jagdeo

May 8, 2017

Dear Sirs: if this e-mail is delivered to the wrong department, please forward it onto the appropriate regulatory commission.

I have been in the life insurance business for over 48 years. During my career I have helped many small business owners and clients build up their retirement plans. To do so I have had to be extremely persistent in calling on and visiting with these clients. I could only do so if I was being compensated by commission. I have spent thousands of hours driving to client's offices and homes to encourage them to save for retirement and 50% of the time I am not compensated or rewarded for my efforts. These clients don't just walk into my office...they are busy conducting their lives and running their businesses, and are too distracted to initiate investing their funds or purchasing life and disability income insurance. It is only the adviser who is compensated by commission who is motivated enough to call on them without being compensated immediately or at all. The commission system has worked wonders across Canada with trillions of dollars of savings and insurance being put into force by commissioned advisers. Billions of dollars of life insurance claims have been paid because of these diligent agents/advisers...benefits to widows and orphans and retirees that otherwise would not happened. Saving for retirement or purchasing life insurance isn't like buying house or car insurance where there are deadlines. Retirement saving and life insurance and disability insurance don't have deadlines and are not provided to millions of people through their employment....why would you want to take this wonder workforce of advisers away from independent business owners and employees not covered by Employee Benefit Packages....like you yourself probably enjoy?

As I mentioned I have been instrumental in helping many clients build up large retirement nest eggs and I have personally delivered millions of dollars of life insurance claim cheques to widows....none of these benefits would have accrued if I just sat in my office and waited for clients to call.

Finally, after 48 years in the business I have never had a formal complaint lodged against me and my clients have never received a fee billing from me. It amazes me that none of my clients have asked me to switch to a fee for service format and yet the Bureaucrats continue to push this agenda. No doubt there are complaints across Canada but please don't ignore the gigantic amount of good that has arisen from Commissioned Advisers.

Kindest Regards,

Rick Reynolds, CLU CHFC

I am a small investor who has in the past believed that mutual fund advice I received from employees at the Big Five Canadian banks (pillars and institutions of the Canadian financial system) and their brokerage arms, was a courtesy in both meanings of the word, that it was sound, that our goals were aligned. Several years ago, my family had experienced the exact opposite dealing with a "financial advisor"* at a "boutique firm" (boiler room-type operation but with IIROC's and OSC's stamps of approval), so sticking again with the banks and with mutual funds felt like an even safer haven by comparison than it did before we ventured 'outside'.

But as it turns out, buying mutual funds through your bank is no guarantee of objective, honest advice. And the new disclosure rules in CRM2 do little to illuminate for the small investor the *magnitude* of the impact "embedded" (hidden) commission fees have on our savings (next paragraph). This stale, outdated incentive model hijacks an "advisor's"* (really salesperson) efforts away from where they should be, from focusing on the individual needs of their client, and instead to steering, and often pushing, clients toward those investments that will yield for the "advisor"* the highest commissions, to varying degrees of detriment to the investor, in most cases significant and in some even tragic. EFTs and index funds are rarely actively promoted, because there is little or no commission and so little or no incentive to recommend to the client what may actually be best for them. But even when exposed (CRM2, media coverage), this conflict of interest is so ubiquitous and so seemingly inevitable, that most people don't even bother caring, and after all, it's only 1% or so.

* *I use quotation marks because to this day no such regulated designation ("Financial Advisor") actually exists in Canada (despite much ado over many years), a painful shock to us at the time, and an outrage still.*

That "1% or so" translates into ***hundreds of thousands of dollars*** in eroded returns over an average Canadian's lifetime, having added absolutely no value. No wonder retirement age **in the 21st century**, in the "age of tomorrow", is not budging, is actually regularly threatening to go *up*, in the era *following* the scientific revolution, industrialization and mass production, computing, the splitting of the atom, deep space exploration, instant global connectivity and access to all information, and the mapping of the genome! Might it be, still, after a too long and painfully bumpy history of finance free-reigning over the land, decimating retirement savings and family legacies, stunting generations and collapsing nations, the same old, circa 19th century, horse and buggy, simple cash flow problems? As in, simply, 'cash' flowing, unimpeded and virtually unchecked, from the average working stiff to the average, evolving backward, obsessed with growth and rabid with greed financial institution, slowly, quietly, surely (well, maybe not so quietly anymore).

For Canadian banks, sadly, transparency and voluntary, meaningful reforms are still a long way away, as is genuine responsibility and accountability to their retail investment clients. Kicking serious, legitimate complaints of advisor misconduct, including of conflicted and inappropriate advice, to the bank's internal ombudsman is worse even than ignoring them, it feeds false hopes and adds gross insult to the serious injury of being oh so politely duped into parting with the more timely, secure and comfortable version of one's retirement. While "provincial securities regulator" carries the respectable and reassuring patina of government, "*internal* ombudsman" at least hints at a conflict of interest (and shouts it at those who have experienced it first-hand), a blatant conflict of which both have made an art and a science (next paragraph). In the case of a bank's ombudsman, whether polite, concerned and caring in tone or delivered in cold, blunt legal-speak, their poorly veiled agenda is to deny (deny, deny, deny) responsibility and avoid exposure, to stall, for months and even years, until the customer finally gives up, their dignity thoroughly trampled, or in the case of an elderly customer, gives up the ghost (even better).

And so you, regulators, you, *public servants*, with all the years and decades-long discussions and debates, costly research, consultations and amassed voluminous technicalized reports to ascertain the obvious (and then *still* ignore it), year after year after year feigning interest in what we the public have to say, how are you different than a bank's own ombudsman?! What are you actually *doing* other than stalling *real change*, who are you *actually* protecting – those you claim to protect, or those you claim to keep in check? And if the increasingly aware public is mistaken on this account, then PROVE IT! ACTUALLY, *"… protect Canadian investors from unfair, improper, or fraudulent practices and foster fair and efficient capital markets"* – don't just busy yourselves with proclaiming it in self-congratulatory marketing sound bites, with endless consultations, with picking off individual bad apples here and there and other low-hanging fruit. ACT! Do the *real*, the *tough* work, *remake* the industry to remake Canada, NOW! Deciding to put an end to the systematic shafting of the Canadian public should not be "an option", should it?!

With an admittedly oversized degree of optimism, I nevertheless hope that the continuous collective input of small investors (*the public*) reaches the *public* organizations addressed in this letter. It is of the *utmost urgency* that the embedded mutual fund fees, that in their effect constitute negative value and significantly and dangerously erode the country's largest pool of savings - private savings - are eliminated, and that institutional and individual fiduciary duty *finally* becomes the cornerstone of the Canadian financial industry in the 21st, the global century, which we are well into. The Canadian public *is* entitled! Entitled to trust its banks and its government, no expert consultations required.

I value this opportunity to provide my input and I grant permission for publication of this letter.

Sincerely,

Julia Lipovetsky,
small investor

Harvey S. Naglie LLM

CSA CONSULTATION PAPER 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS

May 9, 2017

The Secretary
Ontario Securities Commission
20 Queen Street West 19th Floor,
Box 55 Toronto,
Ontario M5H 3S8
Fax: 416 -593-2318
comments@osc.gov.on.ca

Thank you for this opportunity to comment on CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions. While I strongly support the elimination of embedded commissions, I did not intend to participate in this consultation. Familiar with both the large body of work already developed by regulators on this topic and the many articles and op-eds dealing with this issue, I did not think that I could add anything new, different or worthwhile. However, after reading some of the initial comment letters submitted, I became intrigued and a bit concerned by the recurring references to the UK 'advice gap' in several submissions advocating for the retention of embedded commissions. Many of these commenters asserted unequivocally that the UK's decision to eliminate commissions was directly responsible for producing an 'advice gap', i.e. individuals unable or unwilling to pay for financial advice; and they proceeded to warn that Canada would suffer a similar fate if a decision were made to outlaw embedded commissions. Troubled by this worrisome prospect, I decided to learn more about the UK experience and particularly about the cause and nature of the advice gap. This comment letter offers me the opportunity to share what I learned.

The Retail Distribution Review (RDR) came into effect in the UK on December 31, 2012 and applied to every adviser across the retail investment market, including independent financial advisers. The most visible change for many clients was the introduction of explicit fees for financial advice. Historically, advisers relied on commission from product providers to pay at least some of the costs for advice. Regulators took the view that this could give rise to conflicts of interest and prohibited product providers from paying commissions directly to advisers.

Speculation in the UK about the potential emergence of an advice gap began prior to the introduction of RDR and intensified after its launch. Estimates of the size of the potential gap varied widely. In 2012, Deloitte calculated an advice gap of up to 5.5 million consumers, but only two years later Towers Watson estimated no advice gap at all. This confusion was amplified by data showing a decline in the number of financial advisers offering professional advice - from around 26,000 in 2011 to 24,000 in 2014; and an increase in the proportion of retail investment products sold without advice from about 40% in 2011 to 2012 to about two thirds in 2014 to 2015. Many observers blamed the fall in advice usage on RDR's elimination of commissions. They claimed that RDR had made advice less accessible by driving up its cost and reducing the number of advisers. However, many challenged this explanation of the UK advice gap as too simplistic.

Confronted with these conflicting views and inconclusive data, the UK government launched the Financial Advice Market Review (FAMR) in August 2015. FAMR began its work with a public consultation process that asked for evidence on "the extent and causes of the advice gap for those people who do not have significant wealth or income". This request generated a wide range of responses. One of the most emphatic assessments was offered by the Financial Services Consumer Panel (FSCP), the independent statutory body set up to represent the interests of consumers in the development of policy for the regulation of financial services (like the OSC's Investor Advisory Panel). The FSCP asserted that there was no evidence of a glut of savers looking for advice that it could not get. According to the FSCP "consumers do not always seek professional advice, even when they could benefit from it: some are not aware of what is available; they do not want to pay for advice because they do not understand the price or value of it; they cannot afford it; or they prefer to take decisions themselves." In a similar vein, Which?, a UK consumer group that promotes informed consumer choice in the purchase of goods and services, sampled 1,000 UK adults with between £10,000 and £50,000 available to invest and discovered that the demand for advice was not as high as some had thought. Their research found 67% of respondents had never considered using an adviser for advice on a specific investment.

The FAMR consultation also elicited the view that efforts to tackle the advice gap would be misplaced and that public policy should more appropriately focus on addressing the more serious problem, a savings gap. Others suggested that the advice gap would be more aptly described as a 'sales gap' that did widen when banks left the 'advice' market because their staff were generally poorly qualified and did not have a transparent charging structure. Furthermore, they were confident that individuals who need and value advice, rather than product sales, could find it; while any product sales gap left by the departure of the banks was being filled by online discount brokers. Still others suggested that there was enough adviser capacity to satisfy the current demand and the advice gap should be treated as a case of inadequate demand rather than supply. They claimed that the public had been dissuaded from advice in an environment where it was easier to borrow than save, and amid a constant barrage of scandals and fines. This group clearly believed that there was a needs gap, and a habit of longer-term saving had to be restored.

Admittedly, several respondents to the FAMR request, did attempt to provide evidence of an advice gap. They pointed to people who were being turned away by financial advisors that in the past would have served them. They believed that a lot of advisers were setting the bar for new clients much higher than before. However, the FAMR was not convinced by these arguments. In its final report released in March 2016, there was no suggestion that commissions should be reinstated. Instead, the FAMR recommended that regulators and government focus their efforts on supporting the development of new and more cost-effective ways of delivering advice and guidance to consumers through more effective use of technology. The FAMR also noted that absent a more trusting consumer engagement with financial services, it would not be possible to achieve a long-term, sustainable solution to making financial advice more valued by and accessible to consumers.

The FAMR made specific recommendations in three areas:

1. Affordability – Several recommendations were intended to allow firms to develop more streamlined services and engage with customers in a more effective way. These included a proposal to help firms develop mass-market automated advice models to bring them to market more quickly.

2. Accessibility – Several measures were designed to help consumers engage more effectively with advice. These included making their own information more easily available to them and those that advise them and the development of nudges to encourage customers to seek advice at key life stages.

3. Liabilities and consumer redress – Several recommendations dealt with increasing clarity and transparency about the way in which the Financial Ombudsman Service deals with consumer complaints and consumer redress.

These recommendations make clear that the FAMR did not regard the elimination of commissions as the root cause of the UK advice gap. Therefore, while the UK experience does highlight the issue of advice accessibility, it provides no succor for those commenters in the current CSA consultation championing the retention of embedded commissions. The UK review clearly rejected the notion that accessibility could be addressed by reinstating commissions and instead recommended several other initiatives, many of which Canadian regulator would do well to consider adopting.

I thank you once again for the opportunity to provide you with my comments.

Sincerely,

Harvey S. Naglie

(Deliveries on the 22nd floor)

Dear Sirs:

As I read all the articles regarding the matter of removing commissions for advisors I cannot help to look at how often my dealer has decreased my commission grid and increased my costs to do business over the last 3 years.

It has been brought to my attention that dealers and branch managers can manage there advisor grid as they see fit. Well I can tell you my dealer and branch mangers take a lot of monies from me but I have never seen either of them come out to help me with my business growth.

I am a smaller mutual producer so my grid is lower however, if you are looking at making things fair for everyone why would you not consider leveling out this commission grid for all advisor regardless of volume, that is only fair.

Secondly, many branch managers are also advisors so where the fairness is when they can double dip and get paid from our work and well as their own. Is this fair as we are paying them to assist us from the overrides plus the commissions they earn from selling is this fair to clients as well advisors?

I think these two points are matters that must be considered in your overall commission and compensation discussions as I can tell you many advisors fall under this situation and are not happy with the favoritisms and lack of support they are getting from their dealers and Branch managers because they have a smaller block of business. Again is this fair for advisor to have to deal with this and them also losing our commission's small as they may be.

Thanks for your time and trust you will address these concerns in your discussions

A Starving Advisor.

I am a retired senior. I support the discontinuance of embedded commissions in mutual funds. The majority of seniors cannot comprehend complex mutual fund classes with embedded commissions that currently exist. We require plain language in order to assess our investments without the complications of financial jargon and embedded commissions.

Mutual funds sold on a deferred sales basis are particularly harmful to seniors. I want to know the cost of the fund I am buying separate from the cost of the advice. This would allow for a more transparent process and the interests of the client being addressed first and foremost without any incentivized conflict.

Life savings should not be compromised due to hidden commissions. The government is constantly warning citizens to save for their retirement. The quality of one's senior years is dependent on income derived from investments. Often health issues require additional funds that must be used from savings. Embedded commissions are stripping the retirement savings and potential savings of investors. Many, if not most investors are unaware of the hidden cost of embedded commissions. It is very worrisome that Canadians pay some of the highest mutual fund fees in the world. It is time to remove embedded commissions and the negative consequences of these commissions to the financial, social and emotional health of trusting investors. Canadian seniors want transparency, fairness and a "best interest standard" implemented.

The CSA has been wrestling with this issue for over 20 years. There has been ample time for studies, monitoring and consultations. Please act now and protect investors .

M. Boom

London, Ontario.

Permission is granted for public posting of this letter.

Bonjour,

Notre bureau offre des services de planification financière depuis 19 ans, nous avons donc une bonne expérience avec les besoins et objectifs des clients. Voici nos commentaires :

Avantages d’avoir un conseiller indépendant

1) En tant que conseiller indépendant, on recherche le meilleur produit pour notre client au frais le plus bas. Que le produit soit offert par RBC, Fidelity, CI, on va prendre le meilleur gestionnaire.
    a. Il est prouvé qu’un client avec un conseiller indépendant accumule plus d’actifs pour sa retraite. Alors pourquoi mettre plein d’obstacles pour restreindre l’accès au conseil. Les petits investisseurs qui veulent faire croître leur capital ont besoin de conseils éclairés.
    b. La moyenne des actifs de nos clients est beaucoup plus élevée que la population du Québec. Une preuve que le conseil permet aux gens d’accroître grandement leur capital.
    c. Nous sommes rémunérés sur l’actif que l’on gère pour le client. On a donc le même intérêt que le client, faire croître son capital à long terme. Est-ce la même situation dans les institutions bancaires?
2) Un récent rapport des autorités réglementaires (décembre 2016) a mentionné que les problèmes de distributions se situent dans les réseaux à produits captifs, pas dans les indépendants.
    a. Est-ce qu’une institution financière qui offre juste ses produits maison travaille vraiment dans l’intérêt de ses clients? Poser la question est y répondre. Surtout si les produits sont chers en frais et peu performants.
3) Pourquoi les autorités réglementaires tiennent absolument à évaluer la possibilité d’abolir les commissions payées aux conseillers qui améliorent la situation financière de leurs clients alors qu’on laisse de côté tous les produits financiers vendus ici et là sans que le « conseiller » ou le « vendeur » ne détienne de permis approprié ou qu’il ait l’obligation de se former?
    a. Combien ça coute :
        - Un fonds FTQ ou Fondaction (CSN)?
        - Un dépôt à terme émis par une banque?
        - Un billet à capital protégé?
        - Un fonds distinct assorti d’une garantie de à 75% ou 100%?
        - L’achat d’une obligation?
        - Un compte à intérêt quotidien?
    b. La distribution de certains de ces produits n’est pas accompagnée d’une planification de retraite en bonne et due forme, qui viendrait améliorer la condition financière générale du client.

Divulguer le frais total des fonds (RFG)

1) Il faut déclarer au client le frais total (gestionnaire + conseil), pas juste la portion qui est versée au courtier.
    - Le client aura ainsi une meilleure connaissance et compréhension des coûts.
    - Si j'achète un divan, est-ce qu'on me donne juste le prix du cuir ou le prix du divan au complet.
    - En dévoilant le frais complet des fonds, les conseillers travaillant dans les caisses ne pourront plus dire aux clients « Faîtes affaires avec nous car on n'a pas de frais ni commissions, les conseillers indépendants ont des frais et des commissions ».
    - On rencontre souvent des clients qui détiennent des fonds distincts avec des frais de gestion totaux de 4% par an et qui n'en étaient pas du tout conscients.
    - Même si le client sait ce que lui coute le conseil, il doit savoir ce que le gestionnaire lui coute. Il y a d'ailleurs des poursuites aux États-Unis contre des gestionnaires de fonds qui n'ont pas refilé aux investisseurs les économies d'échelle. Plusieurs firmes canadiennes pourraient être poursuivies : Source CFA Newsbrief December 28 2016. Mutual fund trustees are being challenged by investors' lawsuits claiming the trustees have failed to act diligently in the interest of shareholders. Investors accuse trustees of a variety of shortcomings in their conduct, including failing to pass along savings from economies of scale to shareholders as their funds grew and not adequately scrutinizing fees.

2) Les nouveaux rapports (inclus dans le relevé du 31/12/2016) de dévoilement des frais payés par le client sont trop complexes, trop de données. Les clients n'y comprennent rien et referment le papier avant de se rendre à la page 16! C'était évident à prévoir.

Impacts de changer le mode de rémunération à honoraire

1) Nous travaillons en partie avec des comptes à honoraires depuis plus de 10 ans. Ça amène plus d'administration et de suivis à faire. Peu de conseillers vont vouloir s'occuper des clients avec peu d'actifs.
    a. Nous avons effectué des pressions sur les gestionnaires de fonds pour réduire le Frais de gestion et amener des séries à frais plus bas. L'industrie s'est améliorée et doit encore s'améliorer.
2) La rémunération à honoraires va amener les clients à payer plus cher pour avoir les services des conseillers. Voici pourquoi :

a. Présentement, on complète un questionnaire de répartition d'actif avec un nouveau client et on établit une politique de placement. De là le % en actions et en obligations dans le portefeuille.
b. La majorité des fonds paient les commissions de suivi suivantes :
    i. Actions : 1%
    ii. Obligations : 0.5%
    iii. Équilibré : 1%
    iv. Si on veut être logique, les fonds équilibrés devraient verser 0.8% de commission de suivi et baisser le frais de gestion total du fonds de 0.2% + taxes.
    v. Ces % devraient être le maximum qu'un fonds peut verser au conseiller. On enlève ainsi une partie des conflits d'intérêts possibles.
c. On ne voit pas d'incitatif à investir un client plus en actions si la rémunération reliée aux actions est de 1%, comparativement à 0.5% pour les obligations. Il est clair qu'un plafonnement/standardisation de la rémunération règle une partie du problème.
d. Voici ce qu'il va arriver si tous les comptes doivent devenir 100% à honoraires :
    i. Les conseillers n'auront plus de commissions à frais de vente reportées
    ii. Beaucoup de conseillers vont charger 1% ou 1,25% d'honoraire sur l'ensemble du portefeuille
    iii. Ça va donc couter plus cher au client en bout de ligne
    iv. Qui va vouloir servir un client qui a 10 000$ à investir? À 1%, ça donne 100$ de revenu par an. En tenant compte de tous nos frais, le coût moyen par client est de 300$, avant que je sois rémunéré pour mon temps…
    v. Les conseillers qui offrent peu de services vont vouloir maintenir leur rémunération et vont facturer 1% d'honoraire aux clients.
e. Les courtiers de plein exercice des banques ne se gênent pas pour charger 1.25% ou 1.5% d'honoraires aux clients afin d'atteindre leurs objectifs de production et conserver un % de rémunération élevé. Ça coute parfois plus cher qu'un fonds mutuel standard. Est-ce qu'on appelle ça mettre l'intérêt du client en premier?

Nos recommandations

Si on veut simplifier pour les investisseurs (afin qu'ils comprennent, c'est le but primaire) et les conseillers, voici ce qu'il faudrait faire :

- Simplifier l'information fournie aux clients
    - Les rendements sur une page, les frais sur une autre page. Maximum.
    - Les relevés de portefeuilles doivent tenir sur 2-3 pages, oublions le superflu.
    - Déclarer le frais total (RFG) par fonds, en % et en $. Une fois par année et pour le total du compte, pas par plan. KISS (Keep It Simple and Stupid).
    - Les CVC doivent être établis par objectifs. Si l'objectif du client est la retraite, pour son REER, REER de conjoint, CÉLI et compte non enregistré, ils doivent donc avoir un plan global. 1 seul CVC pour tous ces plans. Mon client qui sait que son portefeuille contient 60% en actions et 40% en revenu fixe, il connaît son niveau de risque global. Pourquoi le mêler en indiquant le % de risque par compte quand dans la majorité des cas, l'épargne est pour la retraite? Si un client a un Régime d'épargne études, on fait un CVC séparé pour ce compte dont l'objectif est différent.
    - Éliminer les frais DSC et LSC et garder juste les codes de fonds FEL. Il resterait juste les codes FEL et les Séries F, I, O. Mais en faisant ça, ça va être difficile pour les jeunes conseillers. N'oublions pas qu'un fonds équilibré ou d'actions en série F avec un honoraire de 1% ajouté revient au même coût qu'un fonds mutuel standard dans la majorité des cas.

- Encadrer de plus près les réseaux de distribution où sont les conflits d'intérêts.
    - Interdire les concours et voyages payés aux conseillers et autres concours basés sur les volumes. Dans le domaine des assurances aussi. On est encore surpris que ça existe encore en 2017
    - Plafonner le taux des commissions versées sur les fonds de revenu, équilibrés et d'actions.
- Réduire le fardeau administratif des conseillers. Si on a plus de gestion à faire avec les comptes à honoraires, on pourra servir moins de clients. Et c'est les plus petits comptes qui vont être pénalisés.

Alexandre Brassard, BAA, Planificateur financier

Response to CSA Consultation Paper 81-408

1. Given that mutual fund managers' compensation is based on performance, and considering the fact (taken from Appendix A of the CSA Consultation Paper) that funds that outperform receive more sales and those that underperform receive less, then it is a contradictory argument to suggest that fund managers will underperform to increase cash flows into their funds.

2. The assertion that funds that pay commissions underperform those that do not was certainly not true during the market recession starting in 2007 and ending in March, 2009. All of the equity funds that I was using performed better than the corresponding ETFs or F series Index Funds.

3. Implied throughout this consultation paper is that investors should be investing in the best performing funds. The problem with this is that in my over 30 years in this industry, I have never seen a study, or seen any evidence, that there is a significant correlation between past and future performance. In fact, in an article appearing in February, 2017 in the AdvisorAnalyst.com entitled “Smart Beta Returns (Hint: History is Worse than Useless”), it shows a negative correlation. This was graphically illustrated by Nick Murray, an American who has been in this industry for over 40 years, at one of the last Mackenzie Universities that I attended. He gave the example of the best performing fund over I believe the previous 10 years. This fund had out performed its nearest rival by 4-5% a year. He then asked what we thought the average return was for the people who had invested in that fund during that time period. The correct answer was either -11% or -13%, I can't remember which. The reason for this was that most of the money was invested into this fund at or near its peaks.

Added to the problem of not being able to predict how an individual fund is going to perform is the fact that the relative performance of various sectors of the capital markets varies significantly (Please see attached Fidelity Performance Chart). Then you have Fund Managers having different management styles that perform differently depending on where we are in the business cycle.

So, unless you want to, at best, underperform, or at worst, lose money, you should not be concentrating your investments in the currently best performing funds. When my clients experience significant gains in some of their funds I suggest they take profits, moving those profits to either funds that are currently underperforming but with good growth potential or to fixed income funds until we experience a market correction.

4. One of the things in the CSA Consultation Paper that disturbs me the most is the assertion that we financial advisors sell the funds that compensate us the most. This shows a complete lack of knowledge as to what we do and how we do it.

Whenever we meet with a prospective new client or an existing client with changed circumstances, we initially do a complete financial review to determine the client or client’s current situation. Then we discuss their goals and aspirations. After this analysis we discuss what they should and can be doing in order to meet their needs and achieve their goals. For a portion of the new prospects we have to say that we cannot help them because either they are not in a position to be helped or they are already on track to achieve their goals. Since most advisors hold licences that allow them to provide insurance, bank and investment products, we are able to provide the means by which our clients can achieve their goals.

After it has been determined that the client can and should be putting away money into investments either by doing a periodic investment or a lump sum, or both, and after having an extensive discussion and/or having them do a risk profile questionnaire, we look at providing the investments that will best achieve the investors goals. Especially for investors investing moderate to large lump sums of money, we look at recommending a diversified portfolio to protect them from having too much in the funds or sectors that might go down in value but still having some exposure to the sectors and funds that will perform the best during a given time frame.

For the mutual funds that I am recommending, I do not know exactly what the MERs are until we get to the actual discussion of these when discussing the client's costs. In other words, they play no part in my determining which funds the client should be using. When discussing how I get paid, I say that I get a portion of the MER. Because the MER is a percentage of the money invested, when they do well, I do well, and when they suffer, I suffer. So it is in both of our interests for them to do as well as possible.

One way that regulators could do more to protect the interests of the investor is to require that all persons entering this industry receive the training and education to use such a process.

5. In all scenarios that I have seen showing what investors would have to pay if we switched to fee for service, the vast majority of my clients would be paying more than they are now. For a significant number of my newest and smallest clients, they couldn't afford me and I probably couldn't afford to keep them. How can this be in the best interest of these investors? And for the investors who could benefit from fee for service, under the current system that option is open to them and their advisors.

You may ask why I should care about people with smaller amounts of money to invest; because they probably need the help as much or more than the affluent. Also, I get as much or more pleasure helping people with modest means to become and remain financially independent than I do making the wealthy wealthier.

6. The suggestion that funds invested under the DSC option may deter investors from redeeming even in the face of consistently poor performance ignores the fact that all fund companies have a wide range of funds that the investor could move the money into without incurring a sales charge or restarting the DSC clock. Also I would suggest that if there is a fund with consistently poor performance the fund company is going to give it special attention to get it to perform better. It has been my observation that it seems to be easier to make a poor performing fund perform better than it is to keep a top performing fund on top. In making investment recommendations, I often suggest investing a little higher percentage in funds and sectors that are currently underperforming, especially when I know the fund company and fund manager.

Although I seldom use the DSC option anymore, it can be an effective way for newer advisors to earn some up front income while allowing smaller investors an inexpensive way of getting financial advice.

7. As all of the previous points suggest, I do not believe that there is evidence that the imbedded commission structure creates a conflict of interest. Furthermore, I do not believe that transitioning to direct pay arrangements will stop unethical advisors from doing things that benefit them more than the investor. Many of us who have been in this industry for a considerable time know of

instances where investors have had significant assets churned away by brokers who were paid for every transaction. In the time before trailer fees were introduced, where an advisor was seeing a client with no new services that he/she could provide, he or she might be tempted to change investments to generate income for themselves. I would suggest this could become a significant problem again if trailer fees were eliminated.

To summarize, I believe that the current system serves all investors very well, allowing not just the affluent to get financial advice. I also believe that if Canada transitioned to a direct pay compensation model that it would be much more difficult to start a career in this industry, and many experienced advisors would leave. Consequently, a large number of people would lose access to an advisor.

I work for one of the big 4 brokerage firms in Canada. I have read your report on embedded fees. To clarify, I think deferred sale charge funds are not necessary in the industry. Low loads would also fall in that category.

Most of the mutual funds in my clients portfolios are sold as front end zero. In this case their costs are actually cheaper than fee based options with F class funds.

Banning embedded fees or trailers will actually increase costs to clients. Mutual funds have determined that the cost of advice for the most part is 1%. The cost of advice in fee based accounts for the most part is higher.

If your goal is to raise fees to clients, then go ahead.

COMMENTS ON CSA CONSULTATION PAPER 81-408

I was impressed by its scope , thoroughness , evidence and honesty in exposing all that is wrong (plenty) with the current Investment Fund practices of the various forms of embedded commissions paid by investors and the resulting collateral damage .

Conflicts and misalignment of interests favouring dealers and investment managers , opacity and complexity of layers of fees , higher fees paid , need to navigate through variances between asset classes and fund series , lack of investors control or choice and awareness of what they are paying for . Often investors are receiving little value / advice for fees paid as evidenced in your report .

Few investors really know what they are paying ,(also evidenced in your paper) the CSA CRM 2 was supposed to fix this but sadly fell short of doing just that by not mandating that the MER should be included also . Clients should easily see the TOTAL costs they are paying not just the so called advice portion . Visible full disclosure ! Of course this might lead to sticker shock for too many .

Professional Pension Investment Managers would never accept these conditions and yet the individual investor who is trying to secure his or her own financial future and retirement income faces these obstacles leading to lower outcomes and quality of life . Few individual investors have the sophistication and / or time to understand and evaluate all of this .

Even Do It Yourself investors are victims of the present embedded commissions as when they purchase certain funds or structured products through their discount brokers are still paying invisible trailer fees for nothing without choice or control.

There are investment fund companies who are transparent and do not charge embedded fees but should be able to and want to operate on a level playing field so investors can compare apples to apples

Why not just put the advice back into financial advisor in a more visible manner by having investors who need advice negotiate a fee with their advisor which can be taken out of their account or paid separately along with the MER each broken out individually Educating clients on this fee for service is easier on an even playing field .

COMMENTS ON CONSULTATION PAPER 81-408 Con’t

In the end a client can still have a professional managed portfolio with advice at a lower more transparent cost more aligned with his or her service provider .

CSA needs to put the interests of the Canadian Investor first . ThIs Consultation paper overwhelmingly shows this is not presently happening . The industry will not disappear but will adapt by rolling out better more transparent , cost effective Investment options and reporting . The discontinuing of all embedded commissions is a good start .This will require stewardship , guidance and strong reform . After all these conflicts of interest and misalignment of interests were noted in Gloria Strombergs *Regulatory Strategies for the Mid 90's - Recommendations for Regulating Investment Funds in Canada January 1995 over 20 years ago why was there no action taken on this then ? Why did these practices go on for so long ??*

Stop the “handwringing “ , Canadians deserve ,want and expect regulatory action from their CSA on helping them secure their financial future by eliminating the financial roadblocks that should not be there in the first place !

Frankly the CSA language on page 5 *“ if we decide to move forward “ or on another page “what if any changes “*does not inspire a call to action or change . I hope I am wrong in this perception

Regards

Daniela Rempel
Individual Canadian Investor

To whom it may concern,

First, I struggled where to find a location to send comments back on your website, regarding embedded fees. All I could find was Contact Us: https://www.securities-administrators.ca/aboutcsa.aspx?id=99 So hopefully this is correct.

Next, I have not used funds with DSC fees since 2005-2006, only FE funds at 1%, with NO upfront cost. This hurt a lot in 2008-2009, but it was not the clients fault.

Since about 2011-12, I added in funds that allowed me to charge a 1% commission paid by the client, where relevant, possible (most are possible now) and makes sense to the client financially, which is my next point. By the time these regulations come out, I expect to have as many clients in this type of investment as possible, except where it does not make sense.

I have several clients that are companies or holding companies. For these clients (and they are large), I have left their investments in embedded fee funds, as some of them have NO active income. Therefore, if I were to un-embed (not sure if this is a word) them, the fees would be expensed inside the corporation and there would be NO income to write off the fees against. Additionally, there could be capital gains (or losses) incurred for these corporate clients. Would this not negatively affect them? Is the CSA going to offer to pay the taxes on the gains?

I also have several clients (non-corporate) that have funds outside of an RSP or TFSA as those have already been used up. Some of these funds will have a large capital gain to them, if there is a fee sold. I usually give those clients the option of going “fee based” or embedded, depending on each clients’ situations.

My costs (fees) to these clients are the same whether embedded or not, so that is not an issue to me.

I would suggest that if you are going ahead with this (I know you are), you may want to allow embedding inside corporate accounts, to alleviate this issue for those clients. These are NOT small clients… they have up to $1M invested in them. So, you are trying to help small clients, but hurt big ones. I have no idea how you could help the bigger non-registered clients avoid capital gains taxes… that is your job.

Frankly, if you do get rid of embedded comp (which I fully expect), I will only need to know one code for that fund, instead of two, so it will make my life easier, but you will be hurting these particular clients.

If this does not make sense or is not correct, you have my contact information. If this needs to be sent to someone else, please let me know or forward it to the appropriate person.

I expect there are other comments about things like this that I have not even thought about.

If you have read this far, I thank you for your attention in this matter.

Good luck.

Thanks,

Gord Clark

Re: Canadian Securities Administrators (CSA) Consultation Paper 81-408: Consultation on the Option of Discontinuing Embedded Commissions (Consultation Paper)

On behalf of Investment Planning Counsel Inc. (IPC), we thank the CSA for the opportunity to provide comments on the Consultation Paper.

Our company

IPC is a diversified financial services company, operating on a national platform with over $26 billion in assets under administration as at March 31, 2017on behalf of approximately 260,000 investors across all provinces. Its subsidiaries include IPC Investment Corporation (IPCIC), an MFDA member, IPC Securities Corporation (IPCSC), an IIROC dealer member and Counsel Portfolio Services Inc., (Counsel), a mutual fund manager. IPC is part of IGM Financial Inc., which is a member of the Power Financial Corporation (PFC) group of companies.

General Comments

IPC has a strong interest in the discussion set forth in the Consultation Paper. Founded in 1996, IPC has always adhered to the philosophy that clients are best served through the comprehensive services of an independent financial advisor.

We are supportive of the CSA's overall objectives to set out a more explicit framework for addressing conflict of interest matters and to clarify the nature of the client-registrant relationship for clients, which we believe have been largely met through the Fund Facts pre-sale delivery disclosure (Point of Sale or POS) and Client Relationship Model (CRM) projects, as well as the current proposals in CSA Consultation Paper 33-404 (the CSA CP 33-404).[1] In our view, however, the regulatory option to discontinue embedded commissions will have far-reaching, and we believe, unintended outcomes.

We already have, as the CSA acknowledges, a highly concentrated fund distribution industry in Canada with deposit-taker and insurance owned fund distributors dominating fund distribution. We anticipate that a full transition to direct-pay arrangements will significantly impair the ability of a number of independent dealers and representatives from continuing to service mass-market households and more modest clients, which will diminish both the degree of product and advice choices for investors, as well as, impact the affordability of financial advice. A potential regulatory outcome that leads to an even more concentrated fund distribution industry is not, in our view, optimal for retaining a competitive and innovative financial services industry, nor does it facilitate good investment outcomes for Canadians. We strongly urge the CSA to reconsider the proposals in the Consultation Paper in this context.

Our submissions are structured as follows:

- How the current regulatory reforms underway will address the key investor protection and market efficiency issues identified in the Consultation Paper;
- The market trends and forces underway that arealso driving changes aligned with the CSA's objectives;
- Alternative regulatory options for the CSA to consider instead of discontinuing embedded commissions;
- The impact discontinuing embedded commissions could have on independent dealers, their representatives and their clients, and specifically for IPC.

In addition to our specific comments, we also wish to emphasize the following three key objectives that we believe must guide the CSA's decision-making process for both the Consultation Paper and the current proposals in CSA CP 33-404, which we've been told previously by the CSA to consider together.[2]

---

[1] CSA Consultation Paper 33-404 Proposals to Enhance the Obligations of Advisers, Dealers, and Representatives Toward their Clients (April 28, 2016).

[2] CSA Staff Notice 81-327 *Next Steps in the CSA's Examination of Mutual Fund Fees*, June 29, 2016.

1. Preserving financial advice for Canadians

Personal savings is a key component to the accumulation of financial wealth and retirement readiness. Among other things, households who have and keep an advisor (i) are twice as likely to save for retirement at all ages; (ii) have significantly higher levels of investable assets at all ages; (iii) improve their regular saving for retirement at all income levels; (iv) rate themselves as more financially knowledgeable; and (v) are more confident in their ability to achieve a comfortable retirement.[3] We also know that investors' primary source of financial information comes from their advisors.[4]

Beyond active management ("Alpha") and asset allocation ("Beta"), better financial planning decisions ("Gamma") have a significant impact on an investor's retirement outcomes. In fact, "Gamma" can increase approximately 1.59% in arithmetic "Alpha" on a portfolio.[5] Therefore, as part of the CSA's deliberations, we urge the CSA to be mindful of not proceeding with any regulatory changes that may have the potential to diminish the level of advice provided to Canadians.

2. Not disadvantaging the sale of securities vs. other financial services and products

We share the views expressed by our sister companies within PFC on this topic, that the obligations owed by registrants to their clients should not be dependent on the legal nature of the product being sold or the license held by the registrant. The securities industry is only one part of the financial services sector in Canada. Insurance and deposit products are also significant segments of the capital markets. We found it particularly disconcerting that the CSA suggests in the Consultation Paper that the high level of horizontal integration at deposit-taker and insurance owned dealers somehow leads these firms to focus less on any one business line and more on "gathering assets across all business lines and on directing clients to the appropriate business line". We submit there is evidence to the contrary.[6]To truly enhance the level of advice provided to Canadians, we need consistent reforms across securities, insurance and banking sectors. As part of the CSA's consideration, it will therefore be critical to ensure that any regulatory action does not result in product and regulatory arbitrage with clients being directed towards products that may not best meet their investment needs and objectives.

We believe it is noteworthy that in each of the jurisdictions that has introduced a complete ban on embedded commissions, the ban has extended beyond investment funds. This is a very important

distinction to the proposal in the Consultation Paper. While we welcome the CSA's support for a harmonized regulatory approach for similar products, and we appreciate that the Canadian Council of Insurance Regulators (CCIR) has indicated it will review the CSA policy direction on embedded commissions and assess its appropriateness for segregated funds, the potential for regulatory arbitrage remains. The Consultation Paper also gives no indication of the timeline for the CCIR's review or a commitment for coordinated action with the CSA, nor is there any discussion in the Consultation Paper of whether a similar review is being considered by the Office of the Superintendent of Financial Institutions (OSFI) with respect to banking products, such as GICs and daily interest accounts (DIAs).

3. The need to ensure advice remains affordable and accessible for modest investors

Finally, we believe it is critical for the CSA to ensure that financial services and advice remain accessible and affordable to all Canadians going forward. Research shows that fewer choices of compensation models can limit access to advice and result in higher overall cost if only fee-based compensation is available, particularly for households with more modest investment levels.[7] We believe that the decisions by some global regulators to not proceed with a ban on embedded commissions, in part because of the recognition of the importance of retaining independent dealers and manufacturers to preserve greater choice for investors in their markets, should not be overlooked. We encourage the CSA to consider and provide a more detailed analysis as to why the approaches taken in countries such as Sweden, Hong Kong, Germany, New Zealand and Singapore, among others, would not be appropriate for the Canadian market and for Canadian investors before a regulatory decision is made to discontinue embedded commissions in Canada.[8]

Comments on the Consultation Paper

---

[7] In the United States, the average total cost of fee-based advice is comparable to the cost of advice in Canada (2.00% to 2.20%), however the cost is higher for modest investors with less than $100,000 of financial assets (2.40%) than for high net worth investors (1.70%) (Source: Investor Economics & Strategic Insight, *Monitoring Trends in Mutual Fund Cost of Ownership and Expense Ratios: A Canada-U.S. Perspective,* 2015). Where regulation has been changed to ban or limit commission, the absence of embedded compensation has been found to lower the cost of the product, but the cost of advice was seen to go up. It has also been found that in jurisdictions that have moved to fee-based compensation, those with less wealth or income found it more difficult to get advice than others. Ultimately, all forms of compensation affect advice and outcomes and there is not enough evidence indicating that fee-based compensation will lead to better long-term outcomes than commission-based compensation (Source: Mutual Fund Fee Research prepared for the Ontario Securities Commission on behalf of the Canadian Securities Administrators, written by Dr. Edwin Weinstein, PhD The Brondesbury Group (Spring, 2015) ("The Brondesbury Report")).

[8] Currently, only four countries have imposed a ban on embedded commissions: Australia, Netherlands, South Africa and the United Kingdom. In the Netherlands, the discontinuation of embedded commissions is a voluntary arrangement among the five large banks that dominate investment fund distribution. While under the MIFID II reforms, the imposed ban on embedded commissions only applies to independent financial advisors, which make up only 11% of the European market. Despite MIFID II, a number of jurisdictions have concluded not to impose a ban on embedded commissions, including: Belgium, Denmark, France, Germany, Ireland, Italy and Sweden. Additionally, we have seen a number of other jurisdictions decide not to proceed with the regulatory option to discontinue embedded commissions, among them: Brazil, Hong Kong, India, Israel, Japan, New Zealand, Singapore, South Korea and the United States.

FINANCIAL SOLUTIONS FOR LIFE

Current Regulatory Initiatives Address the Issues Identified
The CSA identified three key investor protection and market efficiency issues with embedded commissions. In our view, the POS and CRM projects, together with the CSA CP 33-404 proposals, once all reforms and/or guidance has been fully implemented, will substantially address each of these issues. To the extent there remains any gap, we submit market forces underway (which we discuss later in our submission) together with other possible regulatory actions (noted below) will achieve the CSA's desired objectives.

1. **Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors**

To suggest that investment fund managers who pay embedded commissions to dealers may be incentivized to rely more on those payments than on generating performance to attract and preserve assets under management is simply not our experience, nor do we believe it is an accurate portrayal of today's competitive market environment.

As we identify below in our discussion of market forces driving changes independent of regulation, our data indicates that the majority of embedded commissions offered by investment fund managers are substantially the same across asset classes and series and that manufacturer margins and costs (management expense ratios) are decreasing. We also note that the trend of dealers and advisors is to shorten the number of fund manufacturers with whom they are working, with the key drivers of dealers and advisors focused on overall performance of the company's products and consistent performance.[9] All of this means that investment fund managers are today aggressively competing on fund costs and performance.

The introduction of the proposals in CSA CP 33-404 will only further increase, in our view, the scrutiny by dealers and their representatives on investment fund costs and performance. The explicit requirements in the know-your-product (KYP) and suitability proposals will require registrants to take into account the impact on the performance of the product of all fees, costs and charges, including any embedded commissions paid as part of the suitability analysis. The reforms also propose that dealers and their representatives will have to assess whether any remuneration, including trailing commissions, could reasonably be expected to inappropriately influence how representatives deal with their clients. We strongly believe that with CSA CP 33-404, the CSA has effectively addressed any residual reliance there may still be today for fund managers to compete on embedded commissions to promote sales or retain assets.

The central purpose of the proposals in CSA CP 33-404 is "to better align the interests of registrants with the interests of their clients". As we've indicated, we believe that the proposals when implemented as rules and/or guidance will address the concerns expressed in the Consultation Paper that embedded commissions may encourage dealers and their representatives to recommend higher cost fund products, or promote a particular purchase option, that pays them a higher commission to the detriment of investor outcomes. In fact, we consider the breadth of the proposed conflicts of interest reform and accompanying guidance in CSA CP 33-404 on compensation arrangements and incentive practices to capture much more than simply any potential for influence caused by embedded commissions. The proposed reform requires dealers to assess whether any remuneration could reasonably be expected to inappropriately influence

[9] Source: Environics Research, *2015 Adviser Perceptions in Canada: A focus on the Future & Consumers* (2015).

how representatives deal with their clients. This approach recognizes that conflicts of interest and the potential for misalignment of interest exists in any fee model, not just with embedded commissions.[10]

2. Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

From the beginning, the POS project was intended to increase investors' awareness and understanding of embedded commission costs, as well as better equip investors to compare the costs of one mutual fund to another, and to understand the impact of such costs on their investment returns. Similarly, the CRM reforms introduced, in the first phase, new relationship disclosure to investors at account opening explaining the types of products and services provided by the dealer as well as more fulsome information on charges, including transaction charges, which they may expect to pay in connection with their investment.[11] Phase 2 of CRM (CRM2) next introduced new annual account level reporting on charges and other compensation of commissions and other amounts paid to dealers, including any embedded commissions in dollar amounts. Like the POS project, the CRM project was intended not only to increase investors' awareness and understanding of dealer compensation costs, but to also lead to better, more informed investor decision making when it comes to dealer compensation costs and the corresponding level of service that's being provided.

Investor knowledge, attitude and behaviour, registrant practices, fees and product offerings, have all been identified by the CSA as potential positive impacts of the POS and CRM2 projects.[12]Without the results of the CSA research project underway to measure the impacts of these projects, we do not believe it's appropriate for the CSA to conclude that discontinuing embedded commissions is necessary to create greater investor fee awareness, or opportunities to negotiate and have greater control over dealer compensation. This position also seems inconsistent with the continued regulatory focus by the Mutual Fund Dealers Association of Canada (MFDA) as well as the CSA to continue to enhance CRM2 disclosures to capture mutual fund management fees, as well as the non-cash incentives that may be paid to the dealer or advisor and its representatives.[13]

3. Embedded Commissions paid generally do not align with the services provided to investors

The concern raised by the CSA in the Consultation Paper of the need for advice and services to better align with the costs paid by investors (directly or indirectly through the trailing commission) is an important issue. However, in our view, this is an issue that may impact all forms of compensation (not just embedded commissions), and is not solved simply by discontinuing such payments. While the direct-pay option may be more transparent to the investor that fees are being paid, investors selecting this option may not be aware of the fees other investors are paying or the services they are receiving, nor will clients necessarily

[10]All forms of compensation affect advice and outcomes (The Brondesbury Report,p 4).

[11]Including the initial sales charge and DSC options and any trailing commissions or other embedded commission paid.

[12]See press release: CSA to Measure Impact of Point of Sale Amendments and Phase 2 of the Client Relationship Model (August 22, 2016).

[13] MFDA Bulletin #0671-P – Report on Charges and Compensation – Consultation Regarding Cost Reporting for Investment Funds (December 18, 2015) and CSA Notice and Request for Comment on Proposed Amendments to National Instrument 31-103, Companion Policy 31-103CP and National Instrument 33-109 (July 7, 2016).

have any market strength to negotiate fees or to realize or to be able to calculate the impact those (now external) fees have on the returns of their portfolio.

In fact, recently we saw the Investment Industry Regulatory Organization of Canada (IIROC) in their review of compensation related conflicts indicate that fee-based accounts may not always be in the best interests of clients.[12]

As noted in the Brondesbury Report, no empirical studies have been done to document whether investors have greater after-fee investment returns with fee-based compensation instead of commission-based compensation.[13] There is no standard fee for service structure in the market place: there can be flat fixed fee, flat fee based on percentage of assets, tiering of fees based on percentage of assets or fees based upon asset classes. IIROC dealer members also have fee for service structures associated with managed accounts in respect of which those fees are for the provision of discretionary investment management services along with other services.

Within our business model, embedded commissions are not strictly limited to providing advisor compensation in exchange for investment advice, but rather support a broad range of services provided by the advisor and dealer. For example, fees are used towards: reporting, portfolio rebalancing, compliance, insurance, regulatory fees, IIROC and MFDA investor protection fees, infrastructure, back-office systems and investor education and may be used towards financial planning and estate and tax planning.

We believe the increased performance reporting and saliency of fund costs and dealer compensation created by the POS and CRM projects will in fact lead to better alignment of overall services and advice with dealer compensation paid. These initiatives, fully implemented, are expected to cause investors to question the overall level of services and advice they are receiving, whether embedded or not, which in turn is anticipated to cause representatives to better demonstrate their value proposition or, lead to investors switching to lower-cost alternatives. If the articulated aims for the POS and CRM projects are met, investors will be empowered to make more informed decisions on whether the fees orcommissions they're paying, embedded or not, are commensurate with their specific needs, expectations and preferences for service and advice.

We expect thiswill prompt greater price and service competition of dealers and their representatives to demonstrate their value proposition and to promote the level of services provided to investors in exchange for dealer compensation. In fact, through our complaint intake management, we have already seen clients questioning their advisors with respect to the services rendered in exchange for the fees they are paying. Our experience is that clients have become more engaged in the discussion of how much they compensate their advisor and dealer, what services are being provided in exchange for such fees, and the frequency and level of engagement they expect from their advisor.

4. Market Forces are Already Driving Changes Aligned to Regulatory Objectives

We strongly believe that competitive market forces, influenced in part by recent regulatory reforms, are already effecting the industry changes that the CSA expects to occur from a ban on embedded

[13] The Brondesbury Report, p 18.

commissions. In particular, we are seeing today the growth and availability of direct-pay options andreductions in fund fees, increased price competition, decreasing fund management costs and market innovations in product distribution and advice.

The CSA is correct to identify that the share of mutual fund assets held in fee-based purchase options (F series) is growing, and growing quickly. Competitive market pressures are driving the growth of F series for many fund manufacturers, with frequent changes to the F series offering or pricing. Fee-based program assets as a percentage of total assets is gaining ground in IIROC platforms, and in full-brokerage the shift in advisor compensation is inline with the shift to fee-based.[14]Our own experience at IPCSC is that fee for service mutual fund holdingshas increased, from 4% to 21% from December 2011 to December 2016.

Where we disagree with the CSA is the discussion in the Consultation Paper that direct-pay options today are not available to all investors in all channels. While it is correct that IIROC dealers generally do not offer fee-based programs to mass-market households, generally because of a lack of scale and the cost to implement, there are direct-pay options available to MFDA representatives today looking for fee-for-service for smaller investors where the dealer program may be restrictive to high minimum investments or fees for the reasons identified.At IPC, in February 2006,we launched a negotiable advisor fee series, Series D for our Counsel funds. This manufacturer sponsored solution allows for the negotiation of an advice and service fee directly between the investor and dealer, through the representative, pursuant to an explicit agreement, and then for Counsel to facilitate the investor's payment of dealer compensation by collecting payments from the investor's investment (through periodic redemptions).Today many fund manufacturers have aSeries D equivalent(often named FB series) and there are other fund manufacturers who offer the same negotiable attributes of Series D in an existing series.

In the last few years, we have also seen a number of investment fund managers, including Counsel, announcing fee cuts, trailer fee cuts, administration fee cuts, preferred pricing programs as well as an increasing number of share classes with lower management expense ratios (MERs) year-over-year.[15]Asset-weighted (MERs) and management fees for long-term funds also continue to decline.[16]

Finally, Canada is now home to more than 80 fintech firms.[17] We believe the increasing innovation and technology we're seeing in the market from both fintech start-ups and from incumbents offers investors choices in product distribution and advice, as well as increase price and competitive pressure on incumbents to demonstrate alignment of fees with the overall level of services and advice provided. We welcome this, and anticipate representatives providing advice will be able to differentiate themselves from asset allocation, advice 'light' platforms.

5. Alternative Regulatory Options to Discontinuing Embedded Commissions

---

[17]Source: PwC, Canadian Banks 2016 Embracing FinTech movement, 2016.

In our view, any potential incremental or possible "complementary" benefit that the CSA anticipates could be achieved through the discontinuation of embedded commissions will be minimal, by comparison to the very real and significant impact to some stakeholders, particularly medium to small independent dealers, their representatives and their clients.[18]To the extent the CSA continues to consider that any of their concerns are not fully addressed, we believe there are other regulatory options available to address such concerns.

(a) **Dealers Offer a Direct-Pay Option** – If the CSA concludesthat there continues to be a need to further enhance investor awareness, understanding and control of dealer compensation, we recommend the CSA considers the regulatory option of requiring all dealers who offer an embedded commission arrangement to also have a direct-pay arrangement option available to all investors. This option could take the form of dealers allowing investment fund managers to facilitate investor payment to dealers of compensation, as contemplated in the Consultation Paper.The inclusion of a direct-pay option would allow both compensation arrangements to be presented and explained to the investorat account opening, or by notification to existing investors, and then give investors a clear choice in remuneration methods while still preserving investor choice.

(b) **Enhanced Dealer Supervision of Advisory Services** –A more impactful and fulsome regulatory response for the CSA to consider to address the CSA's concern thatthe "one-size-fits-all" nature of embeddedcommissions may not align well with the services and advice actually being provided,would be to explicitly enhance the guidance to specify that the dealer has a supervisionobligation to ensure that a commensurate level of advice and service is in fact being provided in exchange for the payment by the dealer to the representative. This would be the case whether that payment is embedded or not.

(c) **Greater Specificity at Account Opening** - The CSA could also consider revisiting the guidance relating to CRM to requiregreater specificity in the current relationship disclosure delivered to investorsat account openingof the advice and services that will be provided in exchange for the dealer compensation to be paid.

(d) **Discontinuing Variable Trailers** - If the CSA takes issue with embeddedcommission rates that vary over the course of the investment, we would submit that it is certainly within the CSA's purview to provide notice that CSA staff will no longer receipt prospectuses with such arrangements

6. Impact on Independent Dealersand their Clients

A ban on embedded commissions will have considerable financial and operational impacts for IPC, and more importantly, on the level of service and advisory support we will be able to provide to our advisors and clients. As at March 2017,mutual fund trailing commissions accounted for 37% of the revenues in IPCSC, and upwards of 95% in IPCIC. Many MFDA dealer members will likely have similar dependencies on these sources of revenue. Evidence drawn from the MFDA Client Research Report indicates that of the assets

[18]As noted by the MFDA, advisors with a book size of less than $2 million are more reliant on DSC commissions to finance their operations. A mandatory switch to fee-based or direct-pay arrangements will therefore have a greater impact on those smaller advisors who are more reliant on DSC commissions (Source: MFDA Bulletin #0721-C – MFDA Client Research Report: A Detailed Look into Members, Advisors and Clients, May 23, 2017, p14 (MFDA Client Research Report).

held by MFDA members, 6% are in no-load funds, 3% are in F class funds and 6% are in fund company administered fee based programs.[19]

As noted above, embedded commissionsare not strictly limited to advisor compensation in exchange for investment advice, but rather support a broad range of servicesprovided by the advisor and dealer to the investor. In addition to a potential loss in the level of services and advisory support we will be able to provide to our advisors and clients should a ban on embedded commissions proceed, we are also concerned that discontinuing embedded commissions may lead to fewer Canadians seeking financial advice.Canadian focused research suggests that despite the high level of trust and reliance investors'place on their financial advisor, only 16% of investorssurveyed would be willing to continue their advisory relationship if it resulted in upfront costs to them.[20]We also note that among Canadians, there's still a strong preference for taking guidance from a financial advisor over advice generated through an algorithm or robo-advisor.[21]

We anticipate that it will be unlikely that we will be able to transition all of the approximately 75% of our retail clientsnot currently in a direct-pay arrangement into a direct-pay arrangement. Coupled with the potential of fewer modest investors seeking advice, we may have feweraccounts to amortize fixed administrative and operational costs resulting inhigher fees for those investors who remain. Today our average fee-based account typically falls within the mid-market to affluent range, whereas most embedded commission accounts fall within the mass-market range. To date, we have been able to subsidizethe administrative and operational costs of more modest size accounts to service these investors through scale – a ban on embedded commissions will impede our ability to do so.[22]

Transitioning to direct-pay arrangements will also cause considerable disruption to investors, requiring accounts to bere-visited and re-papered in the absence of discretionary relief. As noted, IPC would have to take corrective action forapproximately 75%of its clients, which will take considerable time and cause considerable cost, as well as create the need for additional compliance oversight and reviews.

[19] Ibid.

[20]Pierre Lortie, *A Major Setback For Retirement Savings: Changing How Financial Advisers Are Compensated Could Hurt Less-Than Wealthy Investors Most* (Vol 9, 13, April 2016)

[21] HSBC, *Trust in Technology: Country Report/Canada* (May 24, 2017).

[22]The MFDA Client Research Report (p 15) supports this conclusion, finding:

> Advisors may be using the embedded DSC commission paid by the fund company upon purchase to finance the cost of offering advisory services to mass market clients. If so, a ban of embedded compensation would eliminate the DSC commission and may result in advisors having to charge clients an upfront fee to cover the cost of their services. As mass market households are less likely to be able to afford direct-pay arrangements and are less likely to be eligible for fee-based programs, they would be the most impacted by a ban of embedded compensation.

With respect to transitioning to direct-pay arrangements, today IPCSC is carried by NBCN Inc. and relies on its systems for fee-based accounts. Accordingly, we will only be able to offer other types of direct-pay options that NBCN Inc. builds into its systems. For IPCIC, today we have our own nominee platform for fee-based accounts. To the extent other direct-pay options may be introduced, we will have to contract with our back office system supplier to make these available. The time for this transition, as well as cost, will in large part be in the hands of our service providers. For our IPCIC client name business, for anything other than using the fund manufacturer to collect fees based upon a percentage of assets (i.e.D series), we will have to build our own systems to charge and collect fees. All of these system changes will take significant time and cost and with a limited number of back office system suppliers, as we noted, the cost and timing of these changes will be uncertain. Until the back office systems are up and running and these different direct pay options are available,we will not be able to begin the process of transitioning our clients. A related issue that should not be overlooked is how to address clients in non-registered plans or registered plans who do not respond or refuse to move to a direct-pay arrangement. We anticipate that in such instances discretionary relief or regulatory guidance may be necessary.

Conclusion

We firmly believe that the impact of the regulatory actions taken to date, once fully implemented, together with the changes already underway in the market, will substantially achieve the CSA's objectives across all compensation models without the need to implement a ban on embedded commissions.We submit the CSA should allow for any change in business models to occur organically where there is evidence to suggest it is occurring. As theCSA continues to contemplate changes to mutual fund fee models, we urge the CSA to be mindful that discontinuing embedded commissions may have the unintended consequence on modest investors of limiting access to, and increasing the cost of, the very advice contemplated by CSA CP 33-404 to help Canadian investors achieve their long-term investment needs and objectives.

A ban on embedded commissions unnecessarily restricts consumer choice.In our view, there are alternative regulatory options to discontinuing embedded commissions that are able to address any residual issues identified by the CSA, without the same negative impact on independent dealers and their clients and without reducing competition and innovation in our markets that a ban on embedded commissions may cause.We urge the CSA to consider the importance of embedded commissions for dealers operating within the financial planning channel and the potential devastating impacts a ban may have on their operations and solvency, to the detriment of their clients.

An advisor's greatest value to an investor is their ability to help steer the investor's emotions and ensure that they stay the course and commit to their long-term financial plan. Anecdotally, and based on our experience, many do-it-yourself investors have the unfortunate tendency of 'buying high' and 'selling low'.[1]

---

[1]Based on research completed by JP Morgan and Chase within its 2014 Guide to Retirement, an investor holding units of the S&P500 composite index between 1993 and to 2013, who missed out on the 10 best trading days would have annualized returns of 5.4%, relative to 9.2% had they remained fully invested(Source: https://am.jpmorgan.com/us/en/asset-management/gim/adv/insights/guide-to-the-markets/viewer).

Just as we anticipate that each of the 11 targeted reforms and best interest standard proposed under CSA CP 33-404 will require considerable implementation time, so too will the transition to direct-pay arrangements. It is difficult for us to respond to the transition options in the Consultation Paper without a clear understanding of the CSA's direction with respect to both of these proposals. The question is not simply how long theprocess will take to transition to direct-pay arrangements, but how long it will take in combination with a number of other significant regulatory reforms underway. Taking a lesson from CRM2 implementation, we urge the CSA to work collaboratively and early with the MFDA and IIROC and with all registrants as the consultation process continues, so that there is a shared appreciation of thetimeframes needed. For example, we believe further consideration will be needed as to what the CSA would expect regarding the transition to direct-pay arrangement with respect to each client, and whether or how advisors will gather the consent of each client and document the account. The CSA's willingness to grant or codify discretionary relief to facilitate various aspects of a transition under CSA CP 33-404 and the Consultation Paper will also be relevant in determining the implementation time that dealers, their representatives and their clients will need.

Finally, in the Consultation Paper the CSA seem to have positioned the discussion of active vs. passively managed funds as active management being an undesirable outcome for investors that will be remedied through the discontinuation of embedded commissions. In our view, both passive and actively managed investment products are important for our client base, and for maintaining an efficient and vibrant capital markets. As currently expressed by the CSA, we are concerned that some registrants will be inclined to favour passively managed products, not because it is what's most suitable for the client, but because of the perceived regulatory bias and compliance pressures against actively managed funds. We ask that the CSA be mindful of this issue going forward.

We thank you for the opportunity to provide comments on the Consultation Paper. Please feel free to contact me if you wish to discuss this further or require additional information.

Yours truly,
Investment Planning Counsel, Inc.

Re: CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions

The Investor Advisory Panel is pleased for the opportunity to respond *to Canadian Securities Administrators (CSA) Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions*. The Panel is an initiative by the Ontario Securities Commission (OSC) to enable investor concerns and voices to be represented in its rule and policy making process. Our mandate is to solicit and represent the views of investors on the Commission's policy and rule making initiatives.

Executive summary
In our view, the CSA has produced a well written, thorough and evidence-based analysis of the negative effects of embedded commissions on investors. The Panel agrees with the CSA's main conclusions that "*embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors*", that they "*limit investor awareness, understanding and control of dealer compensation costs*," and that embedded commissions paid "*generally do not align with the services provided to investors.*"

Investors are entitled to independent objective and professional advice. However, all too often, they receive advice that is based not on what is the best or even the most suitable product for them, but on what is most enriching for their advisor or firm. Embedded commissions paid by product manufacturers to registrants who sell their products harm investors. CSA commissioned research has provided compelling evidence that embedded commissions and other forms of conflicted compensation do harm to investors. There is also ample evidence that prohibiting embedded commissions as the UK did in its retail distribution review results in less biased recommendations and better outcomes for investors.

The Panel therefore strongly supports a ban on embedded commissions paid by third parties on the sale of all securities, not only on mutual funds, non-redeemable investment funds and structured notes. We call for the prohibition of any compensation or embedded commissions that put the interests of firms and registrants ahead of clients or create a conflict of interest between firms or registrants and investors.

We also agree with the CSA that "*investors should be provided with a compensation model that empowers them and that better aligns the interests of investment fund managers, dealers, and representatives with those of investors*." However, we believe that all forms of conflicted compensation must preferably be addressed at the same time.

The *CSA Staff Notice 33-318 "Review of Practices Firms Use to Compensate and Provide Incentives to their Representatives*" documents firm business models whose compensation and personnel policies are explicitly designed to incentivize and reward registrant behaviour that profits the firm and its employees at the expense of the client. The Investment Industry Regulatory Organization of Canada (IIROC) and the Mutual Fund Dealers Association of Canada (MFDA) also conducted firm compensation practices reviews that provide compelling evidence of systemic conflicted practices which harm investors (*MFDA Bulletin 0705-C, IIROC Notices 16-0297* and *17-0093*). We call on the CSA to address these and all forms of conflicted compensation as well. Specifically, the Panel would like to see prohibited all forms of compensation practices, direct and indirect, that harm investors, beginning with those currently identified in the above-mentioned documents.

Part 1 - Embedded commissions must be banned

The Panel wholeheartedly supports a ban on embedded commissions paid by third parties on the sale of all securities and we ask the CSA to prohibit any compensation or embedded commissions that put the interests of firms and registrants ahead of clients or create a conflict of interest between firms or registrants and investors.

Indeed, there is much evidence that conflicted compensation harms investors. Here are just a few studies that prove this:

> Professor Douglas Cumming's paper, "A Dissection of Mutual Fund Fees, Flows, and Performance," (2015) found that conflicted compensation in the form of sales and trailing commissions paid by fund companies, dealer affiliation and the use of deferred sales charge arrangements materially affects representative/dealer behaviour to the detriment of investor outcomes and market efficiency.
>
> The OSC's 2015 "Mystery Shopping Report" found that, when first meeting with a representative, investors were likely to hear about products and services offered (78%) and discuss their investment goals (89%), but less likely to hear about product fees (56%), the risk/return relationship (52%) or registrant compensation (25%), making it difficult to comparison shop for financial advice, especially on important aspects such as fees and costs;
>
> In 2015, mutual fund fee research prepared for the CSA by the *Brondesbury Group* looked at the extent to which the use of fee-based versus commission-based compensation in mutual funds changes the nature of advice and impacts investment outcomes. It did not find evidence that fee-based arrangements produce better outcomes for investors, however the paper found conclusive evidence that commission-based compensation creates problems that must be addressed. They found, among other things, that funds that pay a commission (sales loads and trailing commissions) underperform those that do not, whether looking at raw, risk-adjusted or after-fee returns.
>
> A paper from the Executive Office of the President of the United States - The Effects of Conflicted Investment Advice on Retirement Savings (2015) – "found that conflicted advice leads to lower investment returns"; "savers receiving conflicted advice earn returns roughly 1 percentage point lower each year (for example, conflicted advice reduces what would be a 6 percent return to a 5 percent return)."

The evidence shows that embedded commissions and conflicted compensation harm investors.

The myth of the advice gap

The Panel would also like to take this opportunity to address the argument being made by some corners of the industry that a so-called "advice gap" will result if embedded commissions are eliminated. We agree with the CSA consultation document which states that they "don't anticipate a significant advice gap will exist" if embedded commissions are discontinued.

Aside from the above-noted research showing how destructive embedded commissions and conflicted compensation are for investors, there is ample evidence that advice is not being used by all Canadians at this time – in fact, just over 50% of Canadian investors work with an advisor according to the CSA 2016 Investor Education Survey.

Far from creating an advice gap, the banning of embedded commissions in the UK and Australia has led to positive strides forward. In the UK, The Financial Conduct Authority's independent post-implementation review of the Retail Distribution Review (2014) found the ban had reduced product bias from advisor recommendations and led to better investor outcomes.

When it comes to an advice gap, let's be very clear: no industry should address the concerns of people who do not want to pay for a service by charging them anyway and hiding the costs. This is not a healthy business model and it should not be acceptable in the Canadian investment industry. It is not transparent nor is it fair.

The only advice gap that needs to be urgently closed is the one between independent and compromised advice – the CSA is in a position to do that.

<u>Panel responses to consultation questions</u>

Q8. Are there other fees or payments that we should consider discontinuing in connection with the purchase or continued ownership of an investment fund security or structured note, including:

a. the payment of money and the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105;

b. referral fees; and

c. underwriting commissions.

As noted below, the Panel is opposed to creating exceptions in these areas and supports discontinuing these payments.

Q11. If we were to discontinue embedded commissions, please comment on whether we should allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf.

Having fund managers collect fees on behalf of dealers is a concern because it will continue the lack of transparency that presently exists with respect to the payment regime. There will also be additional costs for investors as securities are sold (and who gets to decide which ones are sold?) to pay for the fees as well as tax consequences for investors.

Q16. What types of payment arrangements are likely to result if this proposal is adopted? In particular:

- **Would the payment arrangements offered by dealers to investors differ based on investor segment? If so, how and why?**

The concern about payment arrangements is that most dealers will probably opt for fee-based compensation. For investors who tend to hold their investments for long periods of time with little trading activity happening, that would mean they could be paying for but not receiving corresponding services from the dealer.

IIROC's s review states that they found "*a bias on the part of most dealers towards fee-based accounts over commission-based accounts. Most dealers provide the highest possible grid payout to representatives for fee-based revenues. Our concern is that clients may be moved into fee-based accounts whether or not such accounts are consistent with the client's best interest. Certain dealers also stated that, given the attention placed on embedded commissions by the CSA, they are focusing on fee-based accounts as an alternative.*"

Q18. Given some of the changes we have seen in the industry over the past few years (fee reductions, introduction of DIY series, streamlining of fund series, automatic fee reductions increasing access to fee-based options etc.), what is the likelihood that the fund industry will transition away from embedded commissions without regulatory action? In particular:

- **Will the industry continue to transition away from embedded commissions if the CSA does not move forward with the proposal?**

The dependence of the industry on the embedded commission revenue stream would indicate it is unlikely to voluntarily do away with them.

<u>Part 2 - Embedded Commissions are the tip of the iceberg</u>
Embedded commissions are not the only compensation practices that are harmful to investors. In fact, they are just the tip of the iceberg. There are many other practices that must be addressed along with embedded commissions, most of which are outlined at length in the CSA's own Staff Notice 33-318 "Review of Practices Firms Use to Compensate and Provide Incentives to their Representatives," which uncovered numerous examples of poor practices that leave investors underserved and at risk.

This CSA review, which was issued in December 2016, looked at practices at some of the largest firms in the industry both in terms of assets under management and number of approved persons. It considered both direct and indirect forms of compensation and incentives and outlined conflicts observed under each.

The report chronicles a host of troubling forms of compensation and incentive structures that show the extent to which these practices harm investors and erode their trust in

advice. Also prominent on the list of findings are misleading titles and monetary and non-monetary incentives designed to favour proprietary products, a practice used by integrated firms that own both distribution and asset management or product manufacturing.
At integrated firms, staff can also be paid through compensation grids that provide higher payout rates for proprietary products or subsets of products.

According to the report, referral arrangements are, in fact, a significant problem.
As the CSA report noted, the practice of referral arrangements:

"… may encourage representatives to search through their existing books of business to find those clients that could be sold the targeted product or service whether they need it or not. In the case of related party referral arrangements, it may encourage representatives to send their clients to another arm of their firm, even when third party product and/or service options may be more suitable. It may also encourage representatives to shift clients to more profitable business lines within the firm with little or no benefit to the client."

Given the CSA, MFDA and IIROC report findings, the Panel believes that embedded commissions are only one part of a whole spectrum of conflicted compensation practices that are systemic across the industry.

In addition to banning embedded commissions, we call on the CSA and OSC to immediately address the compensation structures and incentives referred to in CSA Staff Notice 33-318.

Part 3 - Embedded commissions – No exceptions approach
Given the CSA report findings that show how investors are harmed by conflicted compensation practices beyond embedded commissions, the Panel opposes the CSA's proposal to leave other forms of compensation unaddressed in its embedded commission ban, including:

- *referral fees paid for the referral of a client to or from a registrant*
- *dealer commissions paid out of underwriting commissions on the distribution of securities of an investment fund or structured note that is not in continuous distribution under an initial public offering*
- *payments of money or the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105*
- *internal transfer payments from affiliates to dealers within integrated financial service providers which are not directly tied to an investor's purchase or continued ownership of an investment fund security or structured note*

The MFDA compensation review expressed concerns about referral arrangements:
"*Compensation arrangements between referring parties that include bonus commissions or initial incentives to enter the arrangement are not specifically prohibited for referral arrangements as they are in a distribution agreement between a dealer and a manufacturing company. There is a risk that firms may look to structure sales arrangements as referral arrangements rather than distribution agreements to avoid certain regulatory requirements*."

Creating exceptions to the ban will only provide room for creative registrants to devise ways to overcome it. Staff Notice 33-318 amply demonstrates the inventiveness of the industry.

<u>Part 4 – Final Recommendations</u>
In order to address the harmful effects of embedded commissions and other conflicted compensation practices, the Panel recommends the following:

A ban on embedded commissions and a plan to address all forms of conflicted compensation – In line with our comments above.

Update and enforce NI 81-105, Mutual Fund Sales Practices – NI 81-105 came into effect in May 1998. This instrument is nearly 20 years old and needs to be updated to reflect the latest practices used to induce sales and must be extended to products beyond mutual funds. As of the date of the Consultation paper there has never been a single enforcement action of NI 81-105. Rules without enforcement are meaningless.

Title and proficiency reform – As the CSA report notes, misleading titles are a very real problem for investors. The CSA, IIROC and MFDA compensation practices reviews document instances of firms awarding titles as rewards for meeting sales targets, a clear abuse that misleads investors.

Titles must be supported by the appropriate level of education, including far more extensive ethics education and demonstrated competency in putting that knowledge to work properly.

Move ahead with Best Interest and targeted reforms – The Panel urges the OSC to move ahead with best interest and the targeted reforms outlined in *CSA Consultation Paper 33-404 - Proposals to Enhance the Obligations of Advisers, Dealers, and Representatives toward their Clients*. This is more important than ever and the Panel supports the Ontario and New Brunswick Commissions as they move forward despite lack of support from other provinces.

In addition, we agree with the statement made in *CSA Consultation Paper 81-408* that "*The discontinuation of embedded commissions also complements the proposals outlined in CSA CP 33-404. Generally, jurisdictions that have enhanced the advisor's standards and obligations have eliminated embedded commissions at the same time (as outlined in Appendix C) because they have recognized that these payments are one of the main obstacles preventing the advisor from working in the interest of their clients. Research suggests that these payments are a conflict that is very difficult to manage or mitigate, except through avoidance*."

OBSI - Move ahead with the recommendations in the Independent Evaluation of the Canadian Ombudsman for Banking Services and Investments' (OBSI) Investment Mandate which was completed in 2016 by Deborah Battell and Nikki Pender.

Rigorous and Regular Enforcement – The Panel strongly believes that effective enforcement of the entire investor protection regime is essential. Rules without enforcement are useless. Equally important, dealers must always be held accountable and liable for their registrants' and agents' improper acts.

To reiterate, we call for the prohibition of any compensation or embedded commissions that put the interests of firms and registrants ahead of clients or create a conflict of interest between firms or registrants and investors. We also call for the prohibition of all forms of compensation practices, direct and indirect, that harm investors, beginning with those currently identified in the above-mentioned documents.

In addition, we ask regulators to take care in implementing any such rules in order to avoid inadvertently advantaging one industry sector over another or invoke other unintended consequences.

Collectively, the actions noted above would result in an investor protection regime that is more consistent with the G20 High-level Principles on Financial Consumer Protection and would vastly improve upon the existing regime -- and it would provide better financial results for investors.

It's time to move forward.

Yours truly,

Ursula Menke

CSA CONSULTATION PAPER 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS

http://www.osc.gov.on.ca/documents/en/Securities-Category8/sn_20170110_81-408_consultation-discontinuing-embedded-commissions.pdf

It is great to **once more** have an opportunity to publish my comments on this subject. I am a retiree who is now 83, who has had an engrossing bad experience with the conflicted sales advice emanating from mutual fund commissioned salespersons. Any contribution I can make towards ending this unsavoury practice will then help to prevent this happening to others.

Before I open up with my current commentary, I have one question to ask of the CSA. What happened to all the constructive information the CSA received from 99 respondents to the - *CANADIAN SECURITIES ADMINISTRATORS DISCUSSION PAPER AND REQUEST FOR COMMENT 81-407 MUTUAL FUND FEES Issued Dec. 13, 2012 ?* It seems like next to nothing has progressed towards a resolution over the past 4½ years because here we are again now debating the same arguments for and against embedded commission issues. Hopefully, this time there will be an investor focused resolution!

Here is why I am still a skeptic when examining the concept of hidden embedded commissions

In preparation for this CSA Submission, I contacted the CSA with five questions related to the disposition of embedded commissions under certain changing "Advisor" to investor relations. I did not get answers to my questions. Instead, I received a response that I should click on a provided link to the OSC and rummage through **74** Rules, Instruments & Policies papers that should be related to my quest. That was a very good suggestion because coincidentally it led me to the **99** respondents to the CSA 81-407 December 13th 2012 Request for Comments. Right there was my 4-page Submission raising some questions about the very issues related embedded questions that are still the subject of this new CSA 81-408 Consultation !

Here is my April 2nd 2013 CSA 81-407 Submission - http://www.osc.gov.on.ca/documents/en/Securities-Category8-Comments/com_20130402_81-407_whitehouse_y_p(1).pdf

The following will in all probability duplicate some of my 2013 previously expressed views

Dealing Representatives (aka "Advisors") should not be receiving sales commissions from the fund company being recommended. It is pure conflict-of-interest (which I will later explain). A payoff - a kickback ! Embedded commissions can also lead to an invitation for other investor abuses such as selling 7-year DSC funds for immediate de-accumulating RRIFs to the elderly and infirm without disclosing the associated liabilities of early redemption fee penalties for the investor. There is also the improper use of Home Equity loans (leveraging) to invest, as well as designing unbalanced portfolios full of expensive equity mutual funds.

Advisors rarely ever recommend a low-cost Index fund or ETF. The more a client invests in mutual funds, the more in trailer commissions a salesperson makes, while at the same time exposing client accounts to subpar performance and greater risk. The situation is even worse and accentuated when the salesperson works to a Commission Grid that increases the commission rate as sales increase. These Commission Grids only skew the advice even more. There is no focus on the investor at all. Commission grids, embedded commissions and sales quotas are wholly incongruent with the ethics of professional advice. **(There is a simple, genuine sales incentive alternative that can provide additional remuneration to the Advisor salesperson that obsoletes the guaranteed embedded commissions and Commission Grids which I will later explain).**

The last two paragraphs sound like echoes from the past

The CSA, the OSC, IIROC and the OBSI cannot pretend that the subject of the inequity and one-sided unreasonableness of embedded commissions is a recent discovery. Why was it necessary to wait until there was a hue and cry of dedicated investor advocates, as well as aggrieved investors, before the subject was again escalated to a debating marathon with the Investment Dealers and their associations ? The damage of the incredible drain on investor assets over the past 20-years or so and into the open pockets of the Investment Dealers and their employees/agents has been a great incentive for attracting individuals to "Financial Advising" careers. And here we are today with a process that is now well engrained, not for the best interests of the investors, but rather for the best interests of Financial Advisors and the Investment Dealers and the Dealer management. Resistance to change of the status quo of embedded commissions should neither have been unexpected nor permitted.

There is more to the embedded commission remuneration process than meets the eye

In the process of examining my Submission, I would like to emphasize that there is more to the reasons why Investment Dealers, their Advisor employees and their associations have been resisting the removal of embedded commissions.

To those parties, the feature of embedded commissions represent more than just being an integral part of a remuneration. Of note, there has been a recent exposure of hidden double commission dipping by a particular group of Investment Dealers that has come home to roost. With embedded commissions, the "Financial Advisors" and the Investment Dealers do even better than the double dipping feature.

These are the additional beneficial attributes enjoyed by "Financial Advisors" and their employer Dealers when they sell embedded commission mutual/investment funds -

- The "Advisor" can negotiate a front-end sales commission with the investor when the "Advisor" is giving advice by recommending a particular mutual fund investment.

- Under the present regulatory rules, the "Advisor" is permitted to convince the investor that no front-end commission would be charged if the "Advisor" sells the mutual fund to the investor on a Deferred Sales Charge (DSC) basis. Hidden from the investor is the 5 ½% to 6% sales commission that would be immediately paid to the dealer/"Advisor" by the MF company when such a transaction is concluded. With this large commission paid to the Dealer/"Advisor" for giving the related investment "advice", there is no commitment to future loyalty to the investor by the "Advisor" ! There is no regulatory requirement that this rate of sales commission be announced to the investor prior to the sales transaction. Also, there is no obligation on the part of the "Advisor" to convey the detrimental impact associated with purchasing on a DSC sales basis. (The absence of DSC sale conditions full declarations opens up a very serious related regulatory issue with the past non-delivery of mutual fund prospectuses (and/or Fund Facts) that I will be happy to convey in greater detail). (IIROCs response to the reported non-delivery of mutual fund prospectuses was that IIROC was happy with the dealers procedures and maybe the prospectuses got lost in the mail !)

- When an "Advisor" sells mutual funds with embedded trailer fee commissions, the "Advisor" then becomes a partner with the investor without having to risk any money. The "Advisor" is guaranteed to continue to get trailer commissions every quarter while ever the "Advisor" convinces the investor to retain the investment. That feature can become conflicting advice for the investor. Arguments put forward by the Investment Dealer interests that the continuing embedded trailer fee commissions from a mutual fund sale is an inducement for the "Advisor" to stick around to give future advice for free is an absolutely bogus projection !

  The facts are, if the investor has a continuing need for making new investments or realigning investments, (ie. RRIFs), the "Advisor" can earn a negotiated front-end commission for that advice when transacting that . next sale, To consider that embedded trailer fee commissions are needed to give advice on the next purchase and then the investor pays a front-end commission or is cajoled into purchasing on a DSC basis, is tantamount to double-dipping.

- If the "Advisor" follows the rules, the "Advisor" will extract confirmation that the investor understands that the investment carries no guarantees that it will hold their original value or increase in value. Over time, the investor can lose valuable assets, however, every quarter the Investment Dealer and the "Advisor" are always guaranteed continuing embedded commissions as long as the investor retains the MF investment. This Investment Dealer and their "Advisor" employee regulatory allowed practice is an inequitable and repugnant unpublished privilege. (I have a personal experience of how our "Advisor" initially walked away with incredibly high 5 ½% and 6% Commissions selling us 80% of our RRIF investments with high risk mutual funds on a DSC basis, then continued to receive trailer commissions after the investments lost about 40% of their original value over a 2 ½ year period.. I am prepared to divulge the shocking full details of this unchecked deception.) This must stop !

- When the “Advisor” sells mutual funds with embedded trailer commissions to their lineup of client investors, the “Advisor” immediately creates an asset value with no cost to the “Advisor”. With some agreement with their Investment Dealer employer, the “Advisor” can sell their list of clients to another “Advisor” (ie. Selling the Book). The relative value of the client list is greatly enhanced by the presence of continuing mutual fund trailer fee commissions. This is one more conflicting hidden financial incentive for the “Advisor” to load down the investor with mutual funds with embedded trailer commissions that must be prohibited.

Embedded commission hidden manipulations that are outside of the investors control

Prior to my contacting the CSA with questions related to the embedded commission issue, I made a request to the OSC and asked them for answers to the same questions regarding the disposition of embedded commissions under certain conditions. There was no answer from the OSC to my questions but they did respond by saying that embedded commissions are sent from the mutual fund company to the Investment Dealer who then distributes the embedded commissions on some pre-arranged agreement with the “Advisors”

Here are the questions I asked of the OSC but received no answers –

1. What happens to the continuation of the embedded commission payouts when an investor terminates their relationship with their Financial Advisor. Who gets the future embedded commission payouts ?
   Q1. Is it just the Dealer ? If so why, when the investor gets nothing in return for the Dealer receiving the embedded commissions.

2. What happens to the continuation of the embedded commission payouts when a Financial Advisor employed by Investment Dealer "A" resigns from an investor's account.
   Q2. Who gets the future embedded commissions payouts ?

3. What happens to the continuation of the embedded commissions payouts when the investor's Financial Advisor employed by Investment Dealer "A" sells the investor's account (selling the book) to another Financial Advisor employed with the same Investment Dealer "A" ?
   Q3. a) Who gets the future embedded commission payouts ?
   Q3 b) This raises the question as to who owns the investor's accounts.

4. What happens to the continuation of the embedded commissions payouts when the Investment Dealer resigns from the investors account ?
   Q4. Who gets the future embedded commission payouts ?

5. What happens to the continuation of the embedded commission payouts when an investor terminates their relationship with a Financial Advisor employed by Investment Dealer "A" and the investor transfers their account to Investment Dealer "B" ? .
   Q5. Who gets the future embedded commissions payouts ?

6. Considering the above questions, what are the regulations when applying the above questions to proprietary in-house mutual funds ?

The Mutual Fund Dealers (MFDA) Report, referred to in the May 23rd 2017 Investment Executive article entitled, “Ban on embedded commissions could take a toll on non-bank dealers”, confirms why the Deferred Sales Charge (DSC) basis sales are promoted for the self-interests of Financial Advisors, which is in direct conflict with the investors best interest.

Here is the link to the full article “Ban on embedded commissions could take toll on non-bank dealers”

http://www.investmentexecutive.com/-/ban-on-embedded-commissions-could-take-toll-on-non-bank-dealers

The article subtitle explanation reads, "New MFDA report also finds that a switch to direct-pay arrangements will "have a greater impact on those smaller advisors who are more reliant on DSCs". This is an incredulous MFDA admission in their Report that, unbeknownst to the unsuspecting investor, they are being deceived to blindly believe that purchasing on a DSC basis is for the benefit of the investor, **when in fact the DSC sale is really for the financial benefit of the "Advisor" and the Investment Dealer with increased hidden commissions over competitive front-end commissions.**

The "Ban on Embedded Commissions" article reports that the MFDA acknowledges that the repugnant excessive 5 1/2% to 6% sales advice commissions of DSCs is needed to help keep a section of independent "Advisors" in business. The MFDA fails to consider and comment on the detrimental implications of unpredictable penalties that the investor must absorb when there is an unexpected need to change or redeem the DSC purchased investments. The potential for this liability for losses to the investor goes unmentioned.

This means that the MFDA condones the conflict of interest that is introduced and the need for investors to subsidize the way of life for a particular group of salespersons who should not be in business if they cannot provide beneficial investment advice worthy of reasonable fees. It would be very unintelligent for an adequately pre-informed investor to agree to take on a DSC liability so that the mutual fund salesperson can take home 5½ % to 6% commission, when the investor could negotiate a 1% or max 3% front-end commission, with no DSC early redemption penalty liabilities !

More importantly, by the MFDA making their observations on the continuing need for "Advisor" salespersons to sell DSC mutual funds in order to stay in business, the MFDA are inadvertently confirming that there is an inherent conflict of interest for the purpose for continuing embedded commissions. That's all the evidence the CSA needs to take immediate action to ban hidden embedded commissions.

***** A full read of the (below linked) May 23rd 2017 MFDA Bulletin Compliance **#0721-C** will help to verify the questionable foregoing information that is used by the SRO MFDA to try to influence a continuance of embedded commissions and especially the continuance of DSC basis mutual fund sales.

===

When investments include locked-in embedded commissions, there is a conflicting self-interest incentive in the hands of the Investment Dealer

There are closely connected issues that require the CSA to examine and redefine, such as –

- Who should have the ultimate controlling and overriding influence over the investor interests once a Financial Advisor solicits investments from an investor and then opens up an account with the Investment Dealer employer ?

  Under the present operational practices that are permitted by the CSA, the Investment Dealer actually assumes ownership of the investor's account immediately after it is opened up by the Financial Advisor. This causes the investors interests thereafter to be subordinated to those of the Investment Dealer. This is wrong, because it is the investor who has the money at stake and who takes all the risks, not the Dealer. The dealer is only there to provide a transaction service, so how can the Dealer assume the power of the ownership of the investor's account when the time comes for the investor's account to be transferred from that Dealer to some other Dealer ?

- The investor pays administrative charges to the Investment Dealer for maintaining the investor's account. This is in addition to any embedded or other sales commissions. Therefore the Investment Dealer should have no legal right to apply discretionary operational practices as though the Investment Dealer owns the investor's account. That is now the case as you will see !
- There is imposing evidence that once a Financial Advisor has opened up an investor account with their Investment Dealer employer, the investor can be subjected to a variety of financial penalties should the investor close out their account because they are dissatisfied with either or both the Investment Dealer or their employee Financial Advisor. In other words, the Advisor can be providing unsatisfactory advice or, in the case of the Investment Dealer, unsatisfactory service. Yet, the investor has to pay penalties to withdraw their account. **This prejudices the investor interest in favour of the Dealer.**
- This discretionary freedom for the Investment Dealer to levy financial penalties is even more egregious when the Dealer causes an involuntary termination of the investor's account. This is a non-theoretical, very real situation that is well explained in a later narrative.

  This involves a case of where the Investment Dealer creates a situation that is against the investor's best interests. The Dealer then reacts by applying a punitive response when the investor moves their account to another Dealer, in order to protect the investor's own best interest.

Here is the real case demonstration that calls for immediate CSA intervention to set up new rules

As a result of recently announced changes in the operations of the Investors Group, there are some basic principles of their operational changes that likewise apply to all Investment Dealers that need to be addressed by the CSA/OSC. This relates to the disposition of investors portfolio investment accounts, especially those with embedded commissions, when Financial Advisors are terminated as employees of the Investment Dealer.

It is important to bring these real live associated issues to the attention of the CSA and the OSC for them to direct some policy decisions and apply appropriate rule changes.

The first issue this Investors Group scenario raises is the overriding very serious question that is, once the investor has been solicited by a Financial Advisor and has purchased investments with embedded commissions through that Advisor, who owns the responsibility for the portfolio account ? Is it the Advisor or the Dealer or the investor ?

Conflicting self-interest discretion of the Investment Dealer

This question of the ownership of the investor portfolio account looms very large when the investor negotiates with the Financial Advisor and understands and places trust that a satisfactory relationship will continue between those two parties. This relationship principle is disrupted and cannot coexist where there is an Investment Dealer discretionary freedom allowed for the Dealer to terminate Financial Advisors like the Investors Group are implementing. The result is that the unsuspecting investor is then at the mercy of the conflicting self-interest discretion of the Investment Dealer.

Here is the May 26th 2017 Investment Executive article detailing the Investors Group operational changes they are making as a result of their dismissing **400** of lower producing "sales force" down to 4,754 older "Advisors".

Here is the link to the IE article –
http://www.investmentexecutive.com/-/investors-group-moving-clients-to-experienced-advisors?utm_source=newsletter&utm_medium=nl&utm_content=investmentexecutive&utm_campaign=INT-EN-morning

Uninvited Investor punitive practices by the Investment Dealer

It is important for the CSA and the OSC to understand and reconcile the detrimental impact of the actions described in the IE article when an Investment Dealer terminates **400** "Advisors" (sales people). These operational actions demonstrate that it is the Investment Dealer who has the discretionary power over the investor's account, not the investor.

There are implications that will have a costly impact on the investor's inherent interests. Investors are being treated like a merchandise inventory when there is a terminating relationship between the Investment Dealer and the Advisor. The net result is that the unsuspecting investor then becomes an additional source of remuneration for the Investment Dealer, their management and a bequeathed successor Advisor, **when the Dealer initiates their employee termination.**

The Investment Executive article explains the Investors Group changes that will be undertaken resulting from the terminating of **400** Advisors, but the article does not offer any critical commentary ! The CSA and the OSC should consider the critical commentary of the impact from any Investment Dealer making similar changes to those being applied by the Investors Group, as covered in the IE article. Here is what the article says -

- Investor accounts whose "Advisors" have been terminated will be re-assigned (handed off) by Regional Managers to other veteran Advisors who have had absolutely no previous or ongoing relationship with the investor. It can only be assumed that this new "Advisor" will immediately inherit and start receiving the embedded commissions, although they have contributed nothing to the interests and relationship with the investor.
- This raises the question, who owns the investor's account, is it the Investment Dealer or the Advisor ? This is an especially pertinent question if the Advisor brought the investor account with them from another Dealer when joining the new Investment Dealer.
- Any investor who wishes to go along with the departing Advisor will be financially penalized for taking their account portfolios away from the Investors Group. But wait, this is a conflict of interest by the Investors Group against the investor, for it is the Investors Group who are seeking the benefit of reducing their sales and management costs at the expense of the investor. This is especially onerous when it involves investors being subjected to DSC early redemption penalties.
- A major consideration with some investment Dealers is that in all probability the Advisors would have sold in-house proprietary mutual funds which raises the question of should the proprietary mutual fund investments be transferable to other Investment Dealers without penalties ?

Considering the forgoing commentary, I highly recommend that the CSA prohibit embedded commissions for all investment products, not just investment funds, without undue delay.
All conflict-of-interest should be avoided- definitely do not depend on disclosure as an investor protection tool.

Investment firms have to do away with such special incentives and inducements, and leave the financial advisor undistracted in seeking the best investment vehicles of financial advice for the client. I urge the CSA to require securities firms and Financial Advisor salespersons to be subject to the more stringent fiduciary/Best Interests standard, as opposed to the looser suitability standard that traditionally has bound them and allowed much misselling and overcharging.

I especially like the idea of unbundling the cost of advice from the product. This will give investors a chance to evaluate the value-add of the advice. When it comes to the life span of a mutual fund, it should be the survival of the fittest, not the ones with the greatest sales financial influencing incentives for the Investment Dealers and their "Advisor" employees. Advice should not be tied to a product sale or retention !

<u>Here is a practical remuneration incentive system to encourage "Advisors" to provide "advice" to all investors, regardless of the size of their investable assets</u>

The arguments put forward by Investment Dealers and their affinity associations that investors with smaller investable assets need the services of embedded commissions because the smaller investors could not afford to separately pay the declared fees for the "advice" delivered. This theory may pass for education in a kindergarten class, but what is the difference between paying an annual 1½% to 2% as <u>declared upfront</u> "advice" fees, in quarterly segments versus hiding 1½% to 2% hidden embedded commissions ?

The idea that hidden embedded commissions are some form of subsidy for smaller investors to get investment "advice" just does not hold water. The facts are that the present hidden embedded commissions are a <u>guaranteed remuneration scheme for the Advisor and the Investment Dealer</u> without any commensurate guaranteed result for the investor. That is both inequitable and totally unacceptable !

Here is the structure of an Advisor remuneration system that is equitable for the value of the advice given to the investor and the performance capabilities of the "Advisor".

After a fully detailed KYC profile of the investor's investing needs are determined and agreed upon, the following agreement would be entered into -

1. At the time of the investor is engaging the services of an Investment Dealer and the "Advisor", there is a mutual agreement between the parties as to the front-end percentage commission or a dollar fee agreed upon for the investment purchases.

2. There is a mutual agreement that the investor will pay fees for the "Advisors" advice services –

(a) Every quarter the Advisor will provide the investor with a comment summary of the performance of the investor's portfolio.

(b) If the investor's portfolio has maintained its value, including any redemptions, the parties agree on a percentage fee or dollar fee <u>that would be paid directly by the investor to the Investment Dealer/Advisor</u> for the quarterly "advice" performance reporting summary.

(c) If the investor's portfolio has gained in value, in addition to the quarterly Advisor "advice" service fee, the Advisor would also receive a bonus percentage of the portfolio gain that is agreed upon by the parties. <u>This is an incentive for the Advisor concentrate on maximizing the performance of the investors portfolio.</u>

(d) If the investor's portfolio would lose value over the quarter, the parties would agree on a scale of reduction of the quarterly advice performance reporting fees. <u>This is an incentive for the Advisor to concentrate on adjusting the investors portfolio to maintain its performance.</u>

==

I, like many other Canadians, should depend on trustworthy advice to manage my retirement account in my best interests. That clearly has been absent from my personal experiences with a bank-owned Investment Dealer over a 7-year period.

There is also the issue that many seniors are deceived by so-called "Free lunch" educational seminars. This is even more divisive when the investing sales presentation is promoted with the inviting title of "Wine, Women and Wealth Seminar". I highly recommend that more precise rules be imposed on how these seminars are promoted and conducted. In the vast majority of cases they are nothing more than sales pitches.

I also urge the CSA to prevent bank-owned investment dealers sending complainants to an "internal Ombudsman". At the best, all that results is a low ball restitution recommendation, not to mention the experience of an outright rejection of valid claims. As there is no regulatory disciplinary oversight of the internal bank Ombudsman when they make false and misleading reasons for rejecting a claim, it is time to remove the bank-owned Ombudsman entirely from the dispute resolution process. If a Dealer rejects a claim they should be directed to OBSI and NEVER to the unregulated entity of the bank "internal Ombudsman", as so many bank brochures do.

This debate on embedded commissions has been going on for decades. It's now time for the CSA to make a bold decision in the face of unrelenting industry opposition. No more monitoring- it's time for ACTION.

A reread of commentary on the **1995** Glorianne Stromberg Report critical of the undisciplined investment industry privileges would now be in order.

Here is the Stromberg Report -
http://www.sipa.ca/library/SIPAdocs/20040409_StrombergSub_NI%2081-107.pdf

Ten years later in **2005**, it seems that very little changed to discipline the undisciplined freedoms enjoyed by the investment industry. Here is the commentary -
http://investorvoice.ca/PI/1647.htm

A further twelve years later in **2017**, the beat goes on looking for the Regulatory authorities to take action to remove the inequitable investing conditions that have unfairly drained hundreds of millions of dollars from thousands of unsuspecting investors into the pockets of condoning Investment Dealers and their "Advisor" employees.

I sincerely hope that the CSA will finally take action to protect Canadians from skewed financial advice. I hope this feedback is useful to you as you set regulatory policy.

I agree to public posting of this letter.

Respectfully,

Peter Whitehouse
An 83-yearold Investor

1er juin 2017

Mémoire de M. Claude Sanche, courtier en valeurs mobilières et courtier en assurances de personnes, sur les enjeux de l'industrie des services financiers.

Présentation :

J'œuvre dans le domaine des services financiers depuis avril 1986.

J'ai toujours été associé avec une firme de courtage indépendante, et j'ai bâti ma clientèle au fur et à mesure, en faisant du démarchage.

Je connais très bien l'enjeu de l'industrie et la difficulté à bien informer les gens.

Problématique

L'industrie s'interroge sur la pertinence de l'abolition des commissions intégrées et des conflits d'intérêts potentiels.

L'objectif de ce mémoire vise à présenter l'opinion d'un conseiller d'expérience, qui vit de ces commissions et aide les gens à mieux planifier leur patrimoine.

Point de vue

Même si les REER existent depuis 1957, les gouvernements tentent constamment d'inciter les gens à penser à leur futur. Ils ont introduit les CELI, puis le RVER et pensent à augmenter les cotisations au RRQ pour financer et augmenter le régime.

Le principal problème de l'épargne, c'est que les gens n'y pensent pas ou n'en font pas leur priorité.

Définitivement, que les gens ne sont pas prêts à débourser, pour recevoir des conseils sur les finances personnelles.

Les gens ne sont même pas prêts à débourser, pour rédiger un testament, qui est une première étape dans la bonne gestion des finances personnelles. Pourtant, il s'agit d'un coût relativement minime, à débourser, souvent, une seule fois.

Depuis déjà plusieurs années, je propose uniquement des fonds à frais d'entrée, en chargeant 0% de frais d'acquisition.

Mon travail est ainsi rémunéré et me permet de suivre :

- des cours de formation sur les valeurs mobilières, sur les assurances,
- l'évolution des marchés,
- l'évolution des lois fiscales,
- de donner du service aux clients,
- de répondre aux questions d'ordre générales sur les finances personnelles des gens
- de payer un loyer et le salaire de mes assistantes
- d'expliquer les aléas des marchés pour que le client ne laisse pas ses émotions gérer son portefeuille,

J'ai bâti ma clientèle et ma crédibilité, sur mes conseils et mon suivi personnalisé. Si j'avais été en conflit d'intérêt avec des fournisseurs, les clients ne me seraient pas restés fidèles. Mes patrons ne sont pas payés en boni sur les actifs. Mes patrons sont mes clients et si je ne livre pas le service auquel ils s'attendent, je vais les perdre.

Les commissions de suivi de crée pas de conflit d'intérêts, comme il en existe dans l'industrie, qui sont pourtant très réels.

1- Que pensez des fonds maisons offerts aux clients au détriment de la concurrence, souvent avec des frais de gestion plus élevés
2- Que pensez des firmes qui imposent des comptes minimaux, avant de redonner au conseiller les commissions générées,
3- Que pensez des firmes qui ferment les yeux sur des transactions répétitives, pour que les objectifs des directeurs soient atteints,
4- Que pensez des firmes qui fixent des quotas de production
5- Que pensez des firmes, qui re-dirigent les plus petits comptes en succursale, pour favoriser la vente de produits maisons, ou des produits à faible taux (tel que les CPG)
6- Afficher la commission de suivi, ne donne pas l'information juste aux clients, il faudrait plutôt, afficher le ratio de frais de gestion global, pour permettre aux clients de faire sa propre comparaison.

Ce sont les ménages avec des actifs de moins de $250000, qui ont le plus besoin de conseils financiers, pour maximiser leurs avoirs parmi les différents véhicules (REER, CELI, REEE, gestion de la dette, des assurances).

Quand on monte un bon portefeuille diversifié, on inclut des fonds mutuels, mais aussi des obligations, des CPG, des actions , et des billets garantis,...

Pour certains de ces produits financiers, le client doit payer une commission à la transaction ou elle est déjà intégrée dans le produit. Si on converti ces comptes, en compte en honoraire, le client se trouve à payer un honoraire sur tous les produits, y compris ceux qui ne devrait pas payer. En bout de ligne, le client se trouve à payer plus cher.

Ce sont alors les firmes qui engrangent plus de revenus, au détriment du client.

Avec le MRCC2 et les feuilles de fonds que nous devons fournir aux clients avant les achats, ceux-ci sont beaucoup mieux informés des frais et les aident à la compréhension, des différents produits financiers.

Il ne faudrait pas non plus, oublier la relève.

Déjà celle-ci est minime, voire inexistante.

Avec l'élimination des frais reporté, il est très difficile à un jeune de commencer dans l'industrie. Si on abolit les commissions de suivi, on va éliminer le peu de relève qui existe.

Ma fille travaille à mes côtés depuis plus de 3 ans. Si je n'avais pas été là, pour la supporter financièrement, juste au niveau des différents coûts, elle ne serait pas là aujourd'hui.

Avec les lois fiscales qui changent constamment, les options de placements qui se multiplient, les gens ont de plus en plus besoin, d'un conseiller indépendant et disponible, pour répondre à leurs besoins, et les suivre, tout au long de leur vie financière.

C'est une grande richesse pour ces gens de compter, sur un conseiller disponible, mais malheureusement, ils n'en connaissent pas la vraie valeur, et en général, ils ne sont pas prêts à payer pour de tels services. C'est pourquoi, le maintien des commissions de maintien est essentiel pour la réussite financière des consommateurs.

Montréal, le 1er juin 2017

À qui de droit,

Je suis contre l'abolition des commissions intégrées pour différentes raisons.

Je suis très triste de voir mon modèle d'affaires remis en question. Depuis bientôt 30 ans (j'ai commencé en janvier 1988), j'offre des services de consultations en services financiers. J'ai le titre de planificateur financier depuis novembre 1997. J'accompagne tant l'entrepreneur, le professionnel, le salarié, la personne qui vient de perdre son conjoint ou en perte d'autonomie que les enfants de ces personnes qui vivent des moments difficiles. J'accompagne mes clients lors de réclamations en assurances de toutes sortes (vie, salaire ou soins de santé). Nous prenons le soin de trouver et remplir les formulaires avec les clients sans demander de rémunération, car les commissions reliées aux produits vendus permettent de faire fonctionner mon cabinet depuis mes débuts dans la carrière. Rares sont les personnes qui n'auront pas besoin d'être conseillées pour faire les bons choix de produits en fonction de leurs besoins. Une majorité des personnes que je rencontre s'en remettent à notre cabinet pour leur trouver des réponses à leurs questions, des produits qui se mouleront à leurs besoins (pas aux produits d'une institution financière en particulier). J'ai le plaisir d'annoncer que je suis un conseiller indépendant et j'ai la conviction d'être indépendant dans le choix des produits que mon cabinet propose. Je n'offre jamais un produit parce que c'est le produit du mois. En près de 30 ans, personne ne m'a dicté de privilégier tel produit plutôt que tel autre parce que c'est la saveur du mois...parce que cela va aider à me classer dans un pour un concours de vente...J'ai la chance de ne jamais avoir été obligé de faire de telles choses et j'espère pouvoir continuer à être libre de pouvoir agir ainsi jusqu'à la fin de ma carrière. Mais l'abolition des commissions sur les produits financiers m'inquiète. C'est comme si du jour au lendemain le versement de commissions devenait une pratique illégale et pourtant combien de clients pourraient témoigner des conseils qu'ils ont reçus gratuitement (payés par le truchement des commissions versées sur les produits).

Combien de fois un client qui souhaitait acheter un CELI sortait du bureau avec ma recommandation de rembourser des dettes coûteuses comme une carte de crédit?

Combien de fois j'ai recommandé à des clients de ne pas racheter leurs investissements (lors de chutes boursières) afin d'attendre la remontée des cours boursiers?

Pourquoi ne pas laisser libres les consommateurs comme actuellement? S'il souhaite ne pas verser de commissions au conseiller, il a le loisir de le faire actuellement. Cela vient en général avec une facture d'honoraires ou la formule sans conseils et le client qui opte pour cela accepte les conséquences de ses choix.

À l'heure actuelle, les gens qui épargnent le plus sont ceux qui ont un conseiller. On ne peut pas se permettre, comme société, de ne limiter l'accès au conseil financier qu'aux mieux nantis. Oui, je suis inquiet! Notre gouvernement semble actuellement bien mal guidé et songe à prendre des mesures très dommageables.

Est-ce bien cela que nous voulons au Canada, des institutions financières plus puissantes (je pense aux banques) et moins de choix? Les banques vont-elles vraiment offrir des conseils? Vont-elles les prodiguer comme elles le font actuellement, en suggérant souvent de prendre des certificats de dépôt parce que c'est la façon la plus facile et

économiquement profitable pour elles de se financer? Cela leur assure du financement stable et garanti pour une période équivalente à l'échéance du CPG (3, 5 ou 10 ans), à des taux dérisoires (1, 2 ou 3 %, par exemple). Et elles peuvent prêter cet argent à des taux beaucoup plus élevés. Pourquoi prendre du temps à éduquer et recommander des placements qui en fin de compte sont moins intéressants pour ces institutions financières?

Si les commissions intégrées sont abolies pour les fonds communs, devraient-elles l'être également pour les obligations d'Épargne Placements Québec, les placements à terme liés au marché, les primes d'assurance et les prêts hypothécaires?

Les petits épargnants souffriraient de l'abolition des commissions intégrées. Plusieurs n'auraient tout simplement pas les moyens de payer des honoraires et se tourneraient alors vers de grosses institutions financières. Ce n'est pas une famille qui arrive à mettre 100 $ par mois dans un REER qui pourra payer des honoraires à son conseiller. Pourtant, cet investisseur a besoin autant sinon plus de conseils.

La nouvelle recherche du CIRANO examine aussi l'accumulation de patrimoine des personnes ayant cessé de consulter leur représentant entre 2010 et 2014 par rapport à celles qui ont continué à en avoir un. Résultat, les premières « ont perdu un pourcentage important de la valeur de leur actif », tandis que les secondes « ont vu la valeur de leur actif augmenter ».

La discipline associée aux conseils financiers de longue date et aux taux d'épargne plus élevés est la clé pour expliquer les grands écarts observés entre la valeur des actifs accumulés par les investisseurs ayant un représentant et celle de ceux n'en ayant pas », précise l'Institut.

Je me demande pourquoi nos élus ne réagissent pas davantage. Au cours des 40 dernières années, l'État n'a cessé de se désengager face à la retraite des Canadiens et des Québécois en créant des REER, des CELI, et plus récemment les RVER. Les initiatives sont nombreuses pour que les gens s'en occupent eux-mêmes. Dans cette optique, il s'avère essentiel de sauvegarder l'accès au conseil financier pour tous les ménages canadiens, pas seulement les riches. L'abolition des commissions pourrait mettre à mal les épargnants de la classe moyenne.

De grâce, apprenons des erreurs des autres comme le Royaume-Uni qui a décidé d'abolir les commissions intégrées en 2013. Résultat? Le tiers des conseillers ont disparu. Est-ce ce genre de situation que l'État souhaite pour notre société?

Dear Sirs/Mesdames:

Re: CSA Consultation Paper 81-408: Consultation on the Option of Discontinuing Embedded Commissions

Capital International Asset Management (Canada), Inc. ("CIAM") is writing in response to the CSA's consultation paper 81-408 (the "Consultation") regarding a consultation on whether to prohibit embedded dealer compensation and require investors to enter into direct pay arrangements.

CIAM's responses below are intended to address the three key investor concerns identified in the Consultation as set out below. While we are supportive of investor protection initiatives and generally agree with the disclosure reforms that are currently underway, we do not believe that banning embedded commissions would either (i) resolve the concerns identified in the Consultation or, (ii) be in the best interests of investors.

In addition to our comments below, CIAM supports and agrees with the comments provided by the Investment Funds Institute of Canada in their response letter dated June 9, 2017 (the "IFIC letter") to the Consultation.

While CIAM is registered in the categories of investment fund manager, portfolio manager and exempt market dealer, our responses below are primarily from the standpoint of an independent investment fund manager and address the three key investor protection and market efficiency issues identified by the CSA in its Consultation.

As a private firm with an independent charter, we are focused on doing what's right for investors over the long term. In Canada, the majority of Capital Group's assets are fee-based; Capital Group has never offered a full (5%) DSC option, and our fees have declined as assets have increased.

1. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors

Consistent with the Brondesbury report, we believe that conflicts of interest are inherent in any type of compensation scheme, whether through the payment of embedded commissions or through fee-based arrangements. While the nature of conflicts may be different in varying compensation models, conflict mitigation strategies could be applied to appropriately address the specific conflicts in order to better align the interests of investors with those of market participants. This was evident in recent reviews conducted by the CSA, IIROC and MFDA regarding the impact of compensation arrangements and related incentives including conflicts associated with such arrangements.

We commend the CSA's survey conducted in 2014 to identify compensation arrangements and incentive practices used by SRO firms to motivate their representatives which resulted in its Staff Notice 33-318 (dated December 15, 2016) and identified several conflict-based practices used by firms to incent its representatives. Such practices included monetary and non-monetary incentives favouring proprietary products, higher grid payout rates for accounts such as fee-based accounts, revenue recognition biases towards types of products sold, product and service-specific promotions and competitions to encourage sales of specific products, among other related practices.

Similarly, related findings pursuant to reviews conducted by the MFDA and IIROC are summarized below:

MFDA Research: The MFDA published its results on May 23, 2017 of a client research report which was conducted in June, 2016 to further evaluate its members' business operations and various business models. As approximately 95% of MFDA members AUA includes mutual funds, the information in the MFDA report identified those business models, advisors and clients on which the CSA Consultation would have the greatest impact in the event embedded fees were prohibited. The MFDA research summarized the following impacts on such stakeholders.

Financial advisory firms (those that almost exclusively employ advisors as agents who are responsible for developing their own book of business and financing their own operations) would likely be most impacted. According to the MFDA report, approximately 56% of advisors with financial advisory firms have small books of business and predominantly rely on DSC commissions to finance their operations. Their clients include mass market clients (i.e. smaller retail investors) who are serviced by advisors who are generally dually-licensed to sell both insurance and mutual fund products. Since the ban on embedded compensation would not apply to insurance products (such as segregated funds), such advisors may be encouraged to recommend products that may not necessarily be in the investor's best interests or those that are subject to the same regulatory requirements and protections. In its summary remarks, the MFDA report states that in its consideration regarding embedded compensation, "regulators will also need to be mindful of all conflicted compensation arrangements that raise similar or even greater regulatory concerns". In addition to insurance offerings, the MFDA report noted concerns with exempt securities and referral arrangements, not covered by the CSA Consultation.

IIROC Compensation Review: The IIROC report dated April 17, 2017 based on a compensation review that focused on (i) business models; (ii) compensation program and (iii) supervision and compliance processes revealed a number of conflict-related concerns with respect to compensation. The IIROC report highlighted a compensation bias in favour of fee-based accounts over commission-based, since: "most Dealers provide the highest possible grid payout to representatives for fee-based revenue… significant number of Dealers provide additional incentives to representatives in the form of performance bonuses linked to fee-based assets." In this regard, IIROC identified potential conflicts regarding fee-based accounts such as reverse churning and several instances where clients in fee-based accounts paid additional fees or where the advisor received additional compensation (i.e. "double-charging"). Another "significant concern" identified related to dealers providing a higher payout for proprietary products which did not result in cost savings for their clients.

According to its report, IIROC will continue to assess dealers' compensation grids, conduct targeted substantive testing of specific NI 81-105 areas related to compensation conflicts and include a new risk factor that considers compensation arrangements in their future compliance reviews.

Next, we would like to address the CSA's assertions in the Consultation based on Professor Cumming's research that embedded commissions can reduce the investment fund manager's focus on fund performance, which can lead to underperformance and inhibit competition in the industry. The Consultation supports the entrance of lower-cost product providers such as passive ETFs as a means of increasing the competitive landscape if embedded commissions were discontinued.

It appears the marketplace is already addressing this issue. As noted in the IFIC letter, there are strong growth trends for both ETFs and fee-based series of funds. Numerous reports, including those from McKinsey, Morningstar and Investor Economics, support the observation that results are the most important contributor to growth of assets.

Capital Group constantly seeks ways to reduce fees to bring economies of scale to our investors. Our funds, which are distributed primarily by third-party dealers, are sold on the basis of their respective long-term performance, low fees and competitive MERs, our marketing materials reflect that we are focused on delivering consistent long-term results using high-conviction portfolios, rigorous research and individual portfolio manager accountability. None of our marketing materials promote the payment of trailer fees; to the contrary, we promote our funds' low MERs in comparison to industry averages.

As noted in the IFIC letter, there is a dominant industry trend towards lower management, administration fees and fee simplification. The competitive market-place is driving constructive change at a notable pace.

We are concerned that the CSA seems to be favouring passive ETFs and index funds in the Consultation. A passive product, while having merits including potentially lower fees, may not necessarily be in the best interests of or be suitable for all types of investors. We believe the market-place, including registered financial advisors, as opposed to the CSA, can best determine which product is most suitable for investors based on a variety of criteria including KYC, KYP, investor risk tolerance and choice.

An unintended consequence of banning embedded compensation is that the cost of advice will likely increase. The IFIC letter documented the value of advice in mitigating detrimental investor behaviour traits. As the MFDA report noted, a typical entry-level fee-based account carries a 150bp fee for services. A typical 60% equity, 40% fixed income portfolio of mutual funds with embedded compensation would have a trailing commission for advice and service of 80bp.

A second unintended consequence, documented in the IFIC letter and MFDA report, is the possibility of an advice gap for investors with lower account balances.

2. Embedded commissions reduce investor awareness, understanding and control of dealer compensation costs

The Consultation comments that the complexity of fund fees increases information asymmetry between investors and product manufacturers and dealers. We agree with the CSA that investor awareness of fees and product structures could be enhanced. While the amount of embedded commissions is already transparent to investors as they are currently receiving annual reports which include the amount of trailing commissions paid in dollar terms, we believe the CSA should focus on enhancing targeted reforms to better educate investors.

In this regard, we commend the CSA's efforts with the implementation of CRM2 and POS and strongly encourage the CSA to consider further amendments to those initiatives to both educate investors and increase fee transparency. Future CRM2 reports could be standardized to show performance and cost information, including MERs, which would serve the dual purpose of increasing investor awareness and competition among market participants. The POS Fund Facts documents could also be enhanced to include:

- the components of the MER in efforts to better educate investors; and
- an investment objective of the fund which is consistent with the objective disclosed in the fund's prospectus. This is particularly relevant as the industry constructively evolves to goals-based investing.

An additional alternative to increase investor awareness would be to consider capping or standardizing embedded fees, as suggested in the IFIC letter. This would assist in leveling the playing field amongst market participants and eliminate the perceived conflict associated with embedded compensation.

3. Embedded commissions paid generally do not align with the services provided to investors

The CSA is concerned that the 'one-size-fits-all' nature of trailing commissions misaligns services and customized advice provided based on investor's specific needs and expectations. Since the overriding concern is with conflicts of interest, we strongly urge the CSA to pursue some of the policy options retained in the Consultation, namely the regulatory reforms referenced above, reviewing sales incentives pursuant to 81-105 and implementing a regulatory conduct standard on advisors per its prior proposal under 33-404.

The perceived misconduct by advisors could be addressed through a code of conduct governing standards that are consistent with legislative obligations similar to the efforts underway in New Zealand by their Ministry of Business, Innovations and Employment. Focusing on the "conduct" of the advisor rather than an ambiguous "best interest" standard, we believe would enhance the advisor-client relationship and thereby, the services provided to investors.
In addition to the above, we strongly support a review and application of the existing NI 81-105 sales practices as an alternative to banning embedded commissions. Currently, these sales practice rules only apply to the distribution of prospectus-qualified mutual fund securities including investment fund managers and dealer firms who offer or distribute such funds. As mentioned above, this limited application to mutual funds creates opportunities for regulatory arbitrage for other market participants. Since its implementation in 1998, NI 81-105 has not been amended to reflect new industry developments. While we are in agreement with the spirit of these rules, we believe there are significant amendments that should be considered to address current issues and conflict-related concerns.

Concluding comments

As discussed above, we believe that banning embedded commissions would have a significant impact on mass market clients without reducing or eliminating the compensation conflict concerns that the CSA is attempting to address in the Consultation.

Thank you for the opportunity to provide our comments. If you have any questions, please feel free to contact the undersigned.

Yours truly,

CAPITAL INTERNATIONAL ASSET MANAGEMENT (CANADA), INC.

AGF | COMMUNIQUÉ

Une nouvelle enquête révèle que les investisseurs sont très satisfaits des conseils financiers fournis au Canada

L'enquête, menée par The Gandalf Group, indique également que les investisseurs ne souhaitent pas modifier la méthode de rémunération de leurs conseillers, auquel cas un « effondrement des services de conseils » pourrait avoir lieu.

Toronto, le 31 mai 2017 – Une nouvelle enquête menée récemment par The Gandalf Group révèle que les investisseurs canadiens s'estiment satisfaits des services actuels de conseils financiers au pays et de la méthode de calcul de rémunération des conseillers. Cette enquête visait à répondre à plusieurs questions concernant les investisseurs particuliers, le secteur des services de conseils, les fournisseurs de fonds et les autorités de réglementation, notamment sur les sujets suivants : les conseils fournis, les frais imputés, la transparence et les options de placement, le rôle des conseillers et les nouvelles exigences de divulgation, la connaissance et la perception des différents types de commissions et de frais appliqués.

« Nous avons chargé The Gandalf Group de conduire une enquête factuelle, objective et centrée sur les intérêts des investisseurs canadiens en ce qui concerne les mesures de réglementation, déclare Blake Goldring, président et chef de la direction de La Société de Gestion AGF Limitée. En tant que société établie depuis longtemps dans le secteur des services financiers, nous avons toujours plaidé pour des changements réglementaires sensés et adaptés aux besoins des investisseurs. »

« Nous sommes heureux de voir que cette enquête couvre précisément ces sujets. Quand il s'agit de l'investissement, nous voulons savoir ce qui préoccupe le plus les Canadiens, afin de nous assurer que les conseillers avec lesquels nous travaillons au quotidien disposent des outils de recherche, des produits et des services nécessaires pour aider les clients à atteindre leurs objectifs financiers », ajoute-t-il.

Les conseillers, une valeur ajoutée

D'après cette étude, la plupart des investisseurs canadiens s'en remettent au moins en partie à un conseiller lorsqu'il s'agit de prendre des décisions concernant leur portefeuille. Près de la moitié d'entre eux déclarent faire appel à un conseiller pour toutes leurs décisions ou presque en matière d'investissement.

Toujours selon l'enquête, les investisseurs suivis par un conseiller sont très satisfaits de la relation avec ce dernier. Aussi, 70 % d'entre eux s'estiment particulièrement satisfaits, tandis que seulement 3 % se disent très mécontents. La plupart des investisseurs suivis par un conseiller se déclarent extrêmement satisfaits de ce dernier, pour ce qui est de leur fournir des conseils objectifs, des informations transparentes au sujet des frais et de les aider à gérer les coûts de l'investissement.

Les profits sont la principale raison de cette satisfaction : les investisseurs qui sont épaulés par un conseiller sont nettement plus susceptibles de considérer la croissance et le rendement de leur portefeuille à la hauteur de leurs attentes, que les investisseurs qui font cavalier seul.

La rémunération des conseillers : les frais et les commissions de suivi

L'enquête révèle également que la majorité des investisseurs trouvent les commissions de suivi acceptables et qu'il s'agit d'une forme de rémunération des conseillers comme une autre. Bon nombre admettent ne pas être très au fait des commissions de suivi qu'ils paient et la moitié avouent ne pas en avoir entendu parler ou presque pas, mais les personnes qui s'estiment bien informées sur le sujet ont plus tendance à juger ces commissions de suivi acceptables.

Pour comprendre la perception qu'ont les investisseurs de ces frais, il est primordial d'examiner la façon dont ils préfèrent rémunérer leurs conseillers et les méthodes de calcul qu'ils privilégient. L'enquête montre que s'ils doivent choisir, les investisseurs préfèrent payer des commissions en fonction de la valeur et du rendement de leur investissement plutôt que des frais de service ou des tarifs horaires. Ils préfèrent même davantage déduire ces frais de l'actif de leur portefeuille, plutôt que de recevoir une facture distincte.

Par ailleurs, l'enquête révèle que si les investisseurs n'étaient plus en mesure de rétribuer leurs conseillers par l'intermédiaire de leurs produits d'investissement et s'ils devaient les payer directement au conseil ou au service fourni, 24 % s'estimeraient moins enclins à faire appel à leur expertise. Ce potentiel « effondrement des services de conseils » est uniformément perceptible auprès de toutes les catégories d'investisseurs, depuis ceux qui disposent d'un actif inférieur à 50 000 $ jusqu'aux bien nantis possédant plus de 500 000 $.

« En tant que société, AGF s'engage à donner le choix aux investisseurs et à leurs conseillers. Nous croyons que les conseillers et leurs clients méritent de pouvoir négocier un modèle de rémunération adéquat, de façon transparente et parfaitement adaptée à leurs besoins respectifs. Par conséquent, nous leur offrons les gammes de produits qu'ils réclament pour assembler des portefeuilles », a expliqué M. Goldring.

Divulgation et déclaration

The Gandalf Group a également mis en évidence que la plupart des investisseurs lisent leurs relevés, du moins de façon occasionnelle; la moitié (soit 51 %) dit consulter chaque relevé. La majorité se déclare satisfaite des renseignements reçus de la part des conseillers, des fournisseurs de fonds et des institutions financières. En effet, nombre d'entre eux (39 %) ont noté des améliorations ces dernières années quant à la quantité d'informations communiquées dans le cadre des relevés. Sur dix investisseurs suivis par un conseiller, six sont au courant des nouvelles exigences de divulgation mises en place l'année dernière.

« Ces résultats viennent étayer notre conviction selon laquelle les changements réglementaires, comme le MRCC2, ont permis d'améliorer les processus et d'accroître la transparence dont bénéficient les investisseurs canadiens, et au sein de l'industrie financière de façon plus générale, a souligné Mark Adams, vice-président principal, chef du contentieux, Placement AGF Inc. Tous les intervenants de l'industrie doivent attendre que ces changements soient correctement déployés et qu'ils stabilisent le secteur avant de proposer d'autres modifications. »

Méthodologie

Les résultats de cette enquête ont été établis après consultation d'un échantillon de 1 299 investisseurs canadiens particuliers.

Un rapport détaillé des résultats peut être téléchargé sur le site Web de The Gandalf Group, à l'adresse **www.GandalfGroup.ca** (en anglais seulement).

Les entrevues dans le cadre de cette enquête ont été menées en ligne, du 7 avril au 5 mai 2017. La méthodologie de recherche employée a été conçue par The Gandalf Group, un cabinet de consultation établi à Toronto et spécialisé dans les recherches par sondage et autres méthodes de recherche quantitative ou qualitative.

Pour en savoir plus sur cette étude, veuillez communiquer avec The Gandalf Group à l'adresse **info@gandalfgroup.ca** ou en appelant le 416-644-4120.

Au sujet de La Société de Gestion AGF Limitée

Fondée en 1957, La Société de Gestion AGF Limitée est une société de gestion de placements diversifiés à l'échelle mondiale qui gère des actifs pour des clients au détail et institutionnels, de même que des actifs non traditionnels et des avoirs de particuliers bien nantis. En tant que société indépendante, nous nous efforçons d'aider les investisseurs à réussir en offrant l'excellence en matière de gestion des investissements et en procurant à la clientèle une expérience exceptionnelle. Notre gamme de solutions d'investissement diverses s'étend à l'échelle mondiale à une vaste clientèle, depuis les conseillers financiers jusqu'aux investisseurs particuliers, en passant par les investisseurs institutionnels comprenant des caisses de retraite, des programmes d'entreprises, des fonds souverains, des fonds de dotation et des fondations.

AGF a des bureaux et des équipes de service à la clientèle sur place, en Amérique du Nord, en Europe et en Asie. Avec un actif géré de plus de 36 milliards de dollars, AGF offre ses produits et services à plus d'un million d'investisseurs. AGF est inscrite à la Bourse de Toronto sous le symbole « AGF.B ».

Re: CSA Consultation Paper 81-408 Consultation on the Option of Discontinuing Embedded Commissions

The Emerging Managers' Board is grateful to the CSA for the opportunity to provide comments on Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions.

Executive Summary

The Emerging Managers' Board is strongly supportive of the proposal to discontinue embedded commissions. We believe the measures should be implemented as quickly as possible. However, we strongly object to the 'mitigation measures' proposed by the CSA. We believe these proposed measures are actually worse than the existing embedded commission system. These mitigation measures replace one form of "bank tax" with another "tax" that is less efficient to administer and results in a worse outcome for fund manufacturers and the investing public.

Introduction to the Emerging Managers' Board

Background: The Emerging Managers' Board or EMB is a non-profit organization whose mission is to promote and contribute to the growth of Canadian emerging managers. It strives to educate asset allocators and investors about the benefits of investing with local talent. We have approximately 120 member firms in Quebec and Ontario, who are primarily independent manufacturers of investment funds. The AUM of the majority of our firm members is below $1 billion.

Confidentiality: All members of the Emerging Manager Board are regulated by a CSA member. As well, their business operations depend critically on broker/dealers for the custodial services, prime brokerage activities and access to their investment platforms for marketing their funds. In order to be able to express our views without fear of repercussions in their businesses, the authors of these comments have requested to remain anonymous.

Responses of the Emerging Managers' Board to Specific Questions

Question 2. *Are there other significant issues or harms related to embedded commissions? Please provide data to support your argument where possible.*

Response of the Emerging Managers' Board: Embedded commissions effectively function as a tax, one that is imposed by brokerages and dealers to pay for access to their platforms. There should be no pretence that the level of embedded fees is justifiable in relation to the amount of due diligence conducted by an Investment Advisor. Fund manufacturers are forced to give up 50% of their management fees (in most cases, their only source of fees) for the privilege of access to a dealer's investment platform. The existence of this *de facto* tax continues to stifle the development of an independent asset management industry and reduce competition, to the detriment of both Canadian investors and firms – particularly newer ones – looking to raise capital. The fact that Canada has one of the highest cost investment fund structures in the world is testament to the negative effects of embedded commissions. The elimination of embedded commissions will promote fair and more efficient operations in Canada's capital markets.

Question 4. *For each of the following investment products, whether sold under a prospectus or in the exempt market under a prospectus exemption: mutual fund, non-redeemable investment fund, or structured note, should the product be subject to the discontinuation of embedded commissions? If not, what would be the policy rationale for excluding it? What would be the risk of regulatory arbitrage occurring in the exempt market if embedded commissions were discontinued for the product only when sold under prospectus?*

Response of the Emerging Managers' Board: To avoid regulatory arbitrage between the Exempt and Prospectus markets or between different types of investment funds, there should be no exclusions from a discontinuation of embedded commissions. Further, all types of embedded fees should be included within this ban.

Question 5. *Are there specific types of mutual funds, non-redeemable investment funds or structured notes that should not be subject to the discontinuation of embedded commissions? Why?*

and

Question 6. *Are there other types of investment products that should be subject to the discontinuation of embedded commissions? Why?*

Response of the Emerging Managers' Board: We are not aware of other investment products that have embedded commissions; however, our conclusions would not change: all investment funds should be subject to discontinuation of embedded commissions.

Question 7. *Do you agree with the discontinuation of all payments made by persons or companies other than the investor in connection with the purchase or continued ownership of an investment fund security or structured note? Why or why not?*

Response of the Emerging Managers' Board: Yes, we agree. Again, all investment funds should be subject to discontinuation of embedded commissions.

Question 8. *Are there other fees or payments that we should consider discontinuing in connection with the purchase or continued ownership of an investment fund security or structured note, including:*

a. the payment of money and the provision of non-monetary benefits by investment fund managers to dealers and representatives in connection with marketing and educational practices under Part 5 of NI 81-105;
b. referral fees; and BUT won't banning referral fees hurt consumers by removing incentives for intermediaries to forward clients onto other intermediaries for their subject matter expertise or access to particular products?
c. underwriting commissions. BUT won't banning underwriting commissions especially hurt start-ups and hinder consumer access to securities?

Why? What is the risk and magnitude of regulatory arbitrage through these types of fees and commissions?

Response of the Emerging Managers' Board: Yes. All embedded fee structures should be subject to discontinuation, including underwriting fees and referral fees especially in the distribution of related entity fund products. Entities that have internal distribution channels (i.e. major bank-owned retail dealers), should not be able to charge underwriting commissions, a significant conflict of interest, while systematically restricting the distribution of non-related entity fund products from their retail platforms. Concurrent with the discontinuation of embedded commissions, attention must be given to the use of non-monetary benefits, as these benefits will become more prominent.

Question 10 a. *With respect to internal transfer payments: a. How effective is NI 81-105 in regulating payments within integrated financial service providers such that there is a level playing field for proprietary funds and third party funds?*

Response of the Emerging Managers' Board: Clearly NI 85-105 is not effective. Canada has one of the most concentrated asset management and one of the most concentrated brokerage sectors in the world, resulting in wide-spread conflicts of interest. This conflict is exacerbated by the systematic practice of limiting third party managed funds to the retail networks of the large integrated financial services providers. Investors' choices are unquestioningly reduced with limited means of redressing the uneven playing field between internal proprietary funds and third party funds.

Question 10 b. *Should internal transfer payments to dealers within integrated financial service providers that are tied to an investor's purchase or continued ownership of an investment fund security or structured note be discontinued? Why or why not? To what extent do integrated financial service providers directly or indirectly provide internal transfer payments to their affiliated dealers and their representatives to incent the distribution of their products?*

Response of the Emerging Managers' Board: Internal transfer payments should also be discontinued. Internal fund managers, brokers, and other financial planners are regularly pressured to purchase related party products. Tactics employed include: moral suasion, grid payout discrimination, minimum asset requirements for types of services, etc. Eliminating internal transfer payments within integrated financial service providers will unquestionably reduce conflicts of interest and allow internal fund managers and brokers to actually act in the clients' best interests.

Question 11. *If we were to discontinue embedded commissions, please comment on whether we should allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf.*

Response of the Emerging Managers' Board: Absolutely not. We strongly object to the 'mitigation measures' proposed by the CSA. As we noted at the outset, we believe these proposed measures are actually worse than the existing embedded commission system. These mitigation measures replace one form of 'bank tax' with another 'tax' that imposes higher operating costs on the administrator which is ultimately passed on to investors. Neither investors nor independent fund manufacturers will have any bargaining power in whether to adopt this practice or not. We will simply end up substituting embedded commission fees with an administratively less efficient 'tax' of similar magnitude. Investors will be no better off.

Question 15. *What effect do you think the removal of embedded commissions will have on investor experience and outcomes? In particular: What effect will the proposal have on the growth of the online/discount brokerage channel and cost of fund products offered in this channel? Is this likely to be beneficial to investors?*

Response of the Emerging Managers' Board: Removal of embedded commissions will result in lower fees, greater investment product choice, reduced conflicts of interest and an opportunity for new asset manager entrants to contemplate creating a business and; thereafter, potentially thrive. An example of the resulting lower fees is in respect of the full service charges that are imposed on DIY investors. According to the Embedded Commission Consultation Paper 81-408, $25 billion of $30 billion held by DIY mutual fund investors are 'sold' full trading commission fund series, so "many DIY mutual fund investors [in the online / discount brokerage channel] . . .indirectly pay for services they do not receive." [1] These DIY investors do not do so by choice. They simply acquiesce to the terms on offer, since all bargaining power lies with their brokerage. If a DIY investor wishes to purchase a fund on a broker platform, the choice is between buying the full commission series or not investing in that fund. Effectively, this is a transfer of wealth from the fund manufacturer to the broker / dealer for no services provided nor advice given; ultimately subsidized by the DIY investor. At the industry standard 1% embedded commission rate, this is a $250 million annual transfer from investors and fund manufacturers to the owners of online / discount brokerages. By eliminating embedded commissions, the revenue of most independent fund manufacturers will effectively double. It will make the fund management industry more competitive at the distribution level and provide investors with greater choice. Investors will clearly benefit from a more competitive fund management industry. In many areas of commercial activity which involve a large, sophisticated organization and a single individual, the harmful consequences of this asymmetry in bargaining power would be addressed by regulatory means. This is what we propose.

---

[1] CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commission, January 10, 2017, page 41

Question 18. *Given some of the changes we have seen in the industry over the past few years (fee reductions, introduction of DIY series, streamlining of fund series, automatic fee reductions increasing access to fee-based options etc.), what is the likelihood that the fund industry will transition away from embedded commissions without regulatory action?*

Response of the Emerging Managers' Board: We see no chance whatsoever that the embedded commissions model will simply wither away on its own. Due to the presence of their existing sales forces – both "captive" or in-house and independent advisors or representatives – existing distributors have a powerful incentive to continue the commission model. In the absence of an economic imperative, only regulatory action will work.

Question 20. *We note that the distribution of fee-based series is still relatively limited in Canada versus other markets. Are there obstacles (structural, operational, regulatory, investor demand, etc.) specific to Canada limiting the use of fee-based series by dealers?*

and

Question 21. *Please describe how discontinuing embedded commissions will affect competition and market structure and whether you agree with the analysis set out in Part 4?*

Response of the Emerging Managers' Board: Canada has one of the most concentrated asset management sectors in the world as well as one of the most concentrated brokerage sectors. Non-monetary incentives and moral suasion are powerful tools used by integrated parties to promote other purchase options over fee-based series. Embedded commissions are effectively a transfer of wealth from the fund manufacturer to owner of a broker platform. By eliminating embedded commissions, the revenue of most independent fund manufacturers will effectively double. It will make the fund management industry more competitive and provide investors with greater choice. Investors will clearly benefit from a more competitive fund management industry and industry concentration should improve. The discontinuation of embedded commissions will undoubtedly lead to new, lower-cost entrants to the market, as a significant barrier to entry will have been eliminated.

To be clear, full adoption of the fee-based series is not a solution in itself. Without rigorous and meaningful conflict of interest guidelines, brokers will explicitly and implicitly promote internal related products over third party investment products.

Question 22. *What impact will the proposal have on back office service processes at the investment fund manager or at the fund dealer? In particular: Is there any specific operational or technological impact that we should take into consideration?*

and

Question 27. *How practicable are the mitigation measures discussed and how effective would these measures be at assuring: choice of payment arrangements for all investor segments, and a level playing field amongst competing investment products?*

and

Question 29. *Other than the potential impacts we have identified in Part 4, what other potential unintended consequences, including operational impacts and tax consequences, may arise for fund industry stakeholders and investors further to the discontinuation of embedded commissions? In particular: would there be a negative tax impact to investors associated with their payment of dealer compensation under direct pay arrangements? In particular, would the investor's payment of dealer compensation through periodic fund redemptions facilitated by the investment fund manager attract tax consequences? Please explain.*

and

Question 32. *For each transition option, please tell us how your business (investment fund manager or dealer) would have to operationally change or restructure in terms of systems and processes and the related cost implications.*

Response of the Emerging Managers' Board: We strongly object to the 'mitigation measures' proposed by the CSA, namely the proposal to "allow investment fund managers or structured note issuers to facilitate investors' payment of dealer compensation by collecting it from the investor's investment and remitting it to the dealer on the investor's behalf." Effectively, each month, an Investment Fund Manager will have to redeem a portion of each fund for every unitholder and remit these tiny amounts to their unitholders' Investment Advisors. Redemptions remain a manual process. The back offices of Administrators and Investment Fund Managers are not designed to deal with huge numbers of tiny transactions. The imposition of such "mitigation measures" will serve as yet another barrier to entry for small independent fund manufacturers and increase the operational costs of these Investment Fund Managers solely for the benefit of Investment Advisors.

Further, investors would be subject to taxation on any such redemption. Both investors and Investment Fund Managers are better off under the current embedded commission system than under the CSA's proposal. The proposed measures will serve to further tilt the playing field against smaller independent Investment Fund Managers and fund manufacturers.

Le 2 juin 2017,

Bonjour,

J'ai pris connaissance de votre mémoire et j'avais bien l'intention de compléter votre liste de question de la consultation.

Beaucoup trop lourd, et honnêtement les commentaires sur le marché, il semble que votre décision est déjà prise. Je tente ma chance en émettant mon humble commentaire sur le sujet.

Je suis dans le domaine depuis 1996, et j'ai à cœur ma profession. Dans chaque domaine activité, il y a des bons et des mauvais travailleurs.

Je gère les portefeuilles de mes clients avec respect, avec toute la transparence concernant les frais associés. Depuis plusieurs années, à nos Congrès et même les compagnies de fonds mutuels nous martèlent que l'industrie est maintenant au compte à honoraire. Encore aujourd'hui, j'analyse mes portefeuilles, je fais une comparaison avec les fonds réguliers et les fonds en part F. Le client est fortement désavantagé, la firme et le représentant ont plus d'argent dans leur poche.

En espérant après cette consultation, que vous aurez des tables rondes pour analyser les choix proposé pour trouver une solution afin de garder cette forme de rémunération.

Déjà la compagnie de fonds Mutuels Dynamic a fait l'annonce de l'abolition des ventes de fonds à frais reportés. Moi, de mon côté depuis plus de 2 ans, et le bureau en général, nous utilisons frais d'acquisition à l'entrée, **nous chargeons aucun montant à l'entrée** et ainsi le client n'a aucun frais de rachat.

Merci de prendre le temps de lire et prendre connaissance de mon modèle d'affaire.

Dear Friends:

Re: Embedded Commissions – CSA Consultation Paper 81-408

We thank you for this opportunity to submit our thoughts on CSA Consultation Paper 81-408 (Embedded Commissions).

Pacific Spirit Investment Management Inc. is licensed as a Portfolio Manager in the Provinces of British Columbia, Saskatchewan, and Ontario. Our firm works exclusively with individual investors and we do not manage funds for institutional investors. We manage approximately $170 million for approximately 170 client families.

We manage each client account separately – each account holds its own investments which are consistent with the Investment Policy Statement for that account. We do not offer any proprietary products – no proprietary funds, no proprietary pools. We are fee-only. The only compensation we receive is the portfolio management fee that we invoice our clients quarterly. **We do not receive any commissions, referral fees, trailer fees, or soft dollars**.

We generally prepare a basic retirement plan for clients as part of the onboarding process when we enter into a new client relationship. We believe that the preparation of a plan serves as an excellent communication tool between ourselves and our client and the plan provides inputs for the Investment Policy Statement.

We have two registered Advisers (Portfolio Managers) who both hold the CPA, CFA, and CFP designations.

Our clients may hold individual equities and fixed income investments as well as mutual funds and ETFs.

When we make mutual fund investments we generally will invest in F class funds to reduce the cost to our clients. However, we will use regular class mutual funds – those that pay a trailer fee to the custodian – where, in our opinion, the cost to the client would be lower holding the regular class fund compared to the F class fund.

Brokerage firms may charge a commission for an F class trade of up to $29 per trade. This would apply to both a purchase and a sell of an F class fund. There are no fees associated with buying or selling a regular class fund. For smaller amounts it is better for our clients to purchase the regular class fund than the F class fund.

A specific illustration will provide some detail. For short-term idle cash we have a choice of leaving the cash in the brokerage account where it earns no interest and is exposed to the creditors of the brokerage firm, or we can purchase CDIC insured mutual funds that pay up to 1.75% per annum F class or 1.5% per annum for regular class. The difference in the rates is the trailer fee (0.25% per annum) paid to the broker. If we have $1,000 to invest in the short-term we would purchase the regular class fund and earn the 1.50% per annum. To cover the $58 potential round trip commission on the F class fund from the extra return (1.75% versus 1.50%) we would need to have the funds in the money market fund for 23 years. Funds with trailer commissions can be a good deal for our clients – especially if the amounts invested are small.

Please do not take away the opportunity for us to use these low cost investment vehicles for our clients.

Pacific Spirit | Investment Management Inc

Thank you for this opportunity to submit our thoughts.

Sincerely,

PACIFIC SPIRIT INVESTMENT MANAGEMENT INC.

John S Clark CPA, CA, CFA, CFP
President

I want to express my concern with the potential banning of embedded commissions. My concerns are tied specifically to the rise in popularity of so called "robo advisors". "Wealth Simple" is one company in particular that has been gaining in popularity. I am 34 years old and many of my peers have asked me about Wealth Simple. Wealth Simple has been very aggressive in it's marketing and has been doing presentations at many companies as well as invests heavily in advertising on social media and on the STM (Bus & Metro). It clearly has a target market: people of my age range that are comfortable investing online. I explored the service myself in order to gain an understanding of it. If you invest over $100,000, you have the option of having an advisor visit you to provide added value. Otherwise, an algorithm provides you with a portfolio based on your risk tolerance.

This is my concern: If embedded omissions are banned, clients that invest less than $100,000 (which is the majority of Quebecers) will not receive any guidance. The advisors that remain in the business under a fee based practice will focus on the larger accounts. Online robo-advisors like Wealth Simple will also discriminate based on assets. This will result in many investors with no where to turn.

Just yesterday, my client who has about $75,000 in her RRSP looked at me and said "I honestly could not and would not have been able to save this much without your guidance, your encouragement and your support". This is the reality for many investors, they rely on the guidance of their advisors, especially those with smaller accounts.

I worry that the banning of embedded commissions, albeit a move which may have good intentions, will result in the ever-broadening gap between the rich and the poor. Wealthier investors will have many avenues at their disposal while smaller investors will have no where to turn.

As regulators, we should we looking for ideas which make the investment landscape more accessible to everyone. If we move to bad embedded commissions, it truly would be a sad day for the average person who is trying to improve their financial situation in life.

Thank you for reading and I wish you the wisdom and the courage to make the right choices.

-Daniel Enayatzadeh

RE: CSA Consultation Paper 81-408; Consultation on the option of discontinuing embedded commissions

Ladies and Gentlemen:

Morningstar Research, Inc. welcomes the opportunity to address the questions posed in the Canadian Securities Administrators' Jan. 10, 2017, paper discussing the proposed discontinuation of embedded commissions. Morningstar Research, Inc. is a leading provider of independent investment research, and our mission is to create products that help investors reach their financial goals. Because we serve individual investors, professional financial advisors, and institutional clients, we benefit from a broad perspective on the impact of the proposed rule and its possible effect on the advice that investors receive.

Exhibit 1 Index Fund Share Across Major Markets, 2007-Present

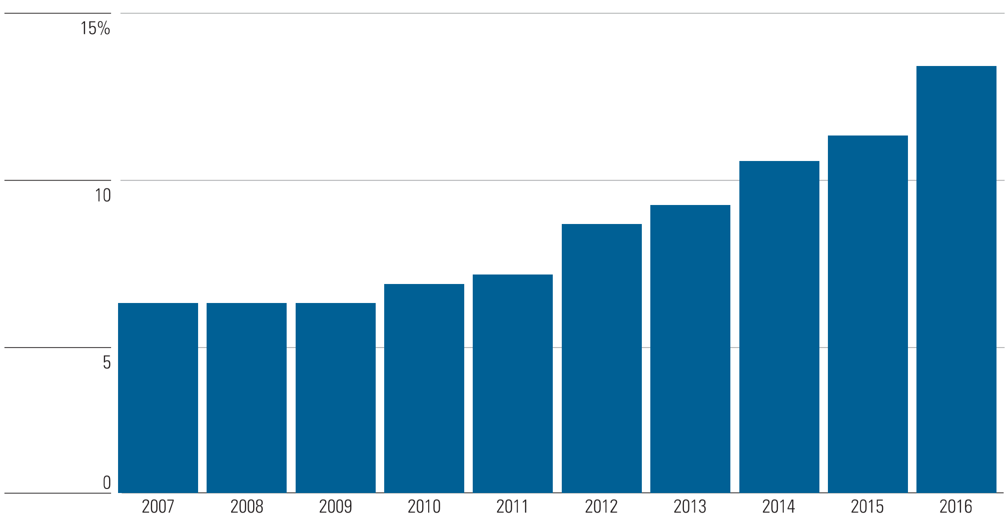
Exhibit 2 Index Fund Market Share, United Kingdom, 2007-16



Source: The Investment Association, Data as of January 31, 2017.

Morningstar believes embedded commissions should be discontinued because they align the financial interests of advisors with asset managers rather than with individual investors seeking advice. While clients' best interests are served by holding lower-cost funds, asset managers have an incentive to promote higher-cost alternatives from which they generate more revenue from fees. Asset managers use embedded commissions to give advisors incentive to favour higher-cost funds, creating a conflict of interest. For example, the commission paid to actively managed funds typically is at least twice that for passively managed funds.

Source: Morningstar, Data as of April 30, 2017.

As a result, advisors in Canada overwhelmingly favour actively managed funds: Index funds constituted 1.3% of commission-based assets as of March 2017, virtually unchanged from January 2007. By contrast, total Canadian indexed assets overall grew from 3.4% to 12.4% over this stretch, thanks mainly to the use of exchange-traded funds by fee-based advisors, institutions, and do-it-yourself investors. Index funds also made inroads in most other major markets, especially the United States, as Exhibit 1 illustrates.

Morningstar expects discontinuing embedded commissions would accelerate flows into lower-cost active funds and index funds. After the United Kingdom introduced new rules outlawing trailing commissions in December 2011, index funds' market share rose sharply after years of stagnant growth, as Exhibit 2 indicates. Index fund assets grew from 6.9% to 13.5% of industry assets from

January 2012 through December 2016. When asset managers could no longer give advisors incentive to favour more-expensive active funds, fewer advisors chose them. We welcome such competition from cheaper passive alternatives, not to displace active managers but to pressure them to become cheaper.

It does not take an imaginative leap to envision what the post-embedded-commission landscape could look like. With increasing numbers of advisors adopting fee-based business models, the proportion of Canadian funds sold without commissions has grown markedly in recent years. While fee-based share classes accounted for 3% of advised fund assets in 2011, they now account for 15%, according to Morningstar data. Price competition was stronger in the fee-based channel over the period. For example, the average fee-based Canadian Equity management expense ratio fell 7 basis points from 2011-16, versus a 3-basis-point decline for the average commission-based fund in the category. We observed similar patterns across most major CIFSC categories, which we depict in Exhibit 3. Without embedded commissions to attract assets, fund managers compete, at least in part, on cost. Removing financial incentives to favour some funds over others encourages advisors to focus on investment quality, of which cost is an important indicator. This result is unambiguously good for fundholders: Lower management fees mean better returns for investors.

Proponents of embedded commissions often characterize the commissions as fees for advice. In most cases, however, these commissions are fees paid by asset managers in exchange for funds sold, not for advice. Under the embedded-compensation model, investors receive varying levels of service but pay a single, set price. Costs may be transparent but what investors get in return is not. Unbundling administrative and operational fees makes the cost of advice explicit. We anticipate that greater transparency will require advisors to offer services commensurate with the fees they charge.

Some have argued that discontinuing embedded commissions risks leaving investors who have relatively small balances without access to advice. But rather than abandoning or de-emphasizing these investors, we anticipate that the delivery of advice for this segment will change and technological innovations in advice will serve this segment. These solutions, commonly referred to as "robo advisors," fill the gap between no-frills discount brokerages and full-service wealth managers. We view the rise of digital advice solutions as positive for investors, as these solutions democratize sophisticated asset-allocation models that had been available only to large institutions.

By inducing competition and lowering costs, improving transparency and accountability, and driving technological innovation, Morningstar believes investors will be well-served by discontinuing embedded commissions.

Very Truly Yours,

Christopher Davis

The Pros and Cons of Discontinuing Embedded Commissions by Regulatory Fiat

Comments submitted to the
Canadian Securities Administrators

by

Pierre Lortie
Senior Business Advisor
Dentons Canada LLP

June 5, 2017

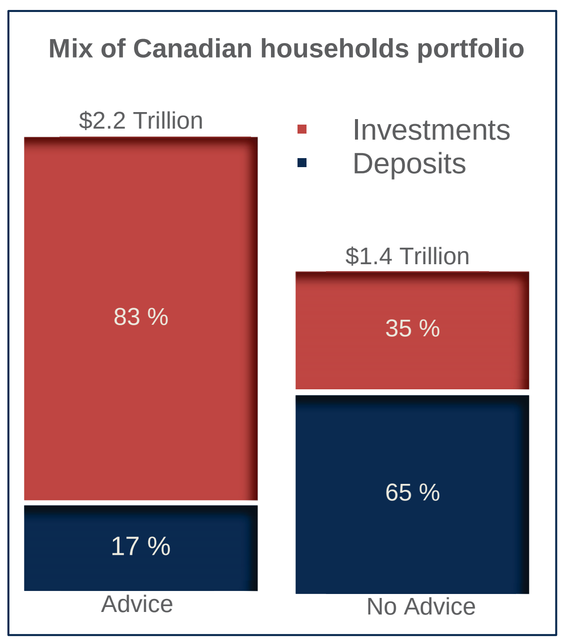
The opinions expressed in this paper are those of the author and do not necessarily reflect the views of Dentons Canada

The Pros and Cons of Discontinuing Embedded Commissions by Regulatory Fiat

The CSA published Consultation Paper 81-408 - *Consultation on the option of Discontinuing Embedded Commissions* in January 2017 (the "Paper"). One of the main virtues of the Paper is the detailed information it contains on the structure of the Canadian fund market and the characteristics of its participants. Our concern is that the policy prescription advocated in the Paper is framed by how the CSA defined the issue of moral hazards inherent in the financial advisor-retail client relationship it seeks to address without much consideration for the critical issue of wealth accumulation, the dominant motivation for households to invest in financial products.

The fundamental role of the financial intermediation function is to facilitate savings and promote sound financial asset management. It follows that the litmus test for retail finance regulations is whether a policy favors and facilitates wealth accumulation by Canadian households. We believe that had this basic tenet been placed at the center of the analysis, the conclusions and the policy prescription would have been quite different from those advocated.

The Paper reports that 63 percent of households do not own investment funds. That some of "these households will typically hold more conservative financial products instead, such as cash, GICs, etc." (p. 28) is a fact. Given the structural modifications in the design of public and private pension programs that have shifted investment performance, inflation, longevity and markets risks onto the cohorts of future retirees, this "reckless" investment conservatism should not be characterized as cautious behavior, but considered the result of a huge "advice gap" that entails considerable socio-economic consequences.



The traditional view is that the dispersion in wealth accumulated at retirement is driven mainly by savings decisions when young.[1] Recent studies emphasize the fact that the allocation of savings between riskless and risky assets, and the choice of risky assets drives returns on individual portfolios. Sound investment practices are thus a powerful force increasing wealth inequality.[2] We also know that households with lower financial capability need to trust their financial adviser in order to invest in risky assets. This reflects in part the fact that a large proportion of households define risk in terms of a loss of capital, not with the range of metrics for measuring investment risk used by academics and the financial industry.

1 Steven F. Venti and David A. Wise, 2001, *Choice, Chance, and Wealth Dispersion at Retirement*, Chapter 1 in Seritsu Ogara, Toshiaki Tachibanaki and David A. Wise eds., *Aging Issues in the United States and Japan*, NBER, University of Chicago Press.

2 Thomas Piketty, 2014, *Capital in the Twenty-First Century*, Harvard University Press.

The Paper does not explain how banning embedded commissions will assist in shrinking this "advice gap" and encourage Canadian households to operationalize the "prudent investor rule" which posits that an investor should undertake to maximize return and minimize risk, matching the risk and expected return of their overall investment portfolio to their particular circumstances.

Observing that "only 22 percent of mass-market households held investment funds" (p.28), the potentially negative impact on this market segment of a regulation disallowing embedded commission is dismissed on the grounds that mass-market households will gravitate towards vertically integrated deposit-taking institutions and insurance firms. The Paper expresses no misgivings with such a regulatory-induced restructuring despite the conclusion of the CSA's own commissioned research to the effect that "affiliated dealer flows showed no flow-performance sensitivity at all which was found to be relatively more detrimental to investors relative to all trailing commission paying purchase options for non-affiliated dealer flows."[3] We will return to this issue.

We agree with the Paper that, in line with the changes observed in other markets, Canadian financial intermediaries are gradually shifting their business model towards a fee based on the value of assets under management ("AUM"). This trend is driven by the strategic intent of broker-dealer firms and other fund distributors to dampen the volatility of revenues arising from a business model based on transaction-related commissions. As the value of assets under management is much more stable, broker-dealers and financial advisors compensation tied to the value of AUMs well serves corporate purposes: stability of revenues, an incentive to grow the AUM and, incidentally, to encourage retail clients to keep up their savings habit. The practical consequence of this change of the business model is that, as the Paper reports for Canada, investors who desire advisory services but who wish to pay for them directly rather than through embedded commissions have limited options because direct pay arrangements for access to professional financial advice are typically available only through dealers servicing higher net worth investors (p. 13), notably IIROC dealers that "typically aim to service households with investable assets of $500,000 or more" (p. 37). The disallowing of embedded commissions will invariably accelerate and accentuate the adoption of the AUM fee-base model with the ensuing consequences concerning access to professional financial advice.

As long as the transition in the financial advice business model is the result of market forces, one would expect the structure of the industry to evolve towards another competitive equilibrium. Regulation should encourage choice. Canadian investors should have access to a wide range of competing products and financial intermediaries, regardless of whether advice is delivered using commission or fee-based advice models.

■ A Preliminary Question

The Paper identifies many areas where the Canadian retail market for funds should and can be improved. It does not, for reasons set out below, make a solid case for disallowing embedded commissions by regulatory fiat. Nor does it address a preliminary question: does the Autorité

[3] Douglas Cummin, Sofia Johan and Yelin Zhang, *Frequently Asked Questions about the Dissection of Mutual Fund Fees, Flows and Performance Report*, CSA, 2016.

des marchés financiers ("AMF") have the right to prohibit an industry practice common around the world in the face of strong evidence that households investing with the guidance of a financial advisor, the majority under the prevailing pricing regime, accumulate substantially larger financial wealth than those who do not?

The AMF's mission includes the supervision of the activities related to the distribution of financial products and services.[4] The meaning of "supervision" is to oversee, superintend, keep under surveillance, monitor. It is a dubious proposition to suggest that the phrase covers the imposition of a business model for the distribution of financial products and the outright ban of a practice that has long been accepted and has been proven to be effective in facilitating access to financial advice.

The standard of judicial review that concerns parliamentary delegations of legislative authority to administrative agencies addresses whether an agency action is "in excess of statutory jurisdiction, authority, or limitations, or short of statutory rights". Courts have held that an administrative agency's power to regulate in the public interest must always be grounded in a valid grant of authority from the legislator and that the ambit of the rule must not be in excess of statutory jurisdiction, authority, or limitation, or short of statutory right.[5]

In this regard, it is worth noting that with respect to the churning of accounts, Article 193 of the Québec Securities Act specifically provides that "no dealer or adviser may multiply transactions for the account of a client solely to increase his remuneration". As far as embedded commissions are concerned, Québec securities legislation is silent.[6] In contrast, in Europe, the MiFID II Directive which imposes limits to the use of commissions and stricter requirements for product distribution and design and mandates improved disclosure of costs and charges in the financial retail markets was adopted by the European Parliament on 15 April 2015[7].

Hence, the preliminary question: can the AMF impose a ban on embedded commissions in the absence of an explicit mandate from the Québec National Assembly?[8]

■ THE PRINCIPAL-AGENT CONUNDRUM

The central thesis of the Paper is that financial advisers are in a situation of conflict of interest vis-à-vis their clients, a position exacerbated by embedded commissions. Therefore, by prohibiting embedded commissions to broker-dealers, the problem is solved.

There is no denying that because financial advisers generally perform the dual function of advising clients and selling financial products, it exposes financial consumers to both adverse selection and moral hazards. Although the commingling of the advice and sale roles is typical of technically complex product markets, academics and policy-makers in Canada and abroad have, as the Paper does, questioned the appropriateness of arrangements where the remuneration of financial intermediaries distributing financial products and providing advice is

[4] Act respecting the Autorité des marchés financiers, art. 4.

[6] Act respecting the Autorité des marchés financiers and the Québec Securities Act.
[7] The Directive is set to come into effect for all investment firms on 3 January 2018, four years after its adoption.
[8] This preliminary question applies to all other securities commissions in Canada.

embedded in the price of the financial products and dependent on commissions and other contingent fees from the manufacturers of financial products rather than being paid directly by their customers. It remains that the wisdom of an unbundling policy is not a forgone conclusion. There exists little empirical evidence to support the assertion that fee-based pricing favor behavior more responsive to client interest. Weinstein, in a study commissioned by the CSA, concludes from his review of the literature that "it is not yet clear whether moving from commission-based to asset-based compensation will result in a net improvement in the overall return to the investor."[9] Very little is known "about individual responsiveness of financial advice outside an environment with moral hazard"[10] and what is known about advice taking and receiving does not favour the superiority of the neutral advice hypothesis.[11]

The findings of several academic studies suggest that when evidence does exist that the financial advice given as a matter of course was not optimal, concerns about the role of commission-based arrangements were not as problematic as those set out in the Paper. An analysis of a sample of 12,000 individual investment accounts for a 34-month period at a large retail German bank leads to the conclusion that the "empirical evidence is broadly in line with honest financial advice."[12]

One important factor overlooked in the Paper is that financial advisers want to sustain their business over time; the repeated-game nature of the relationship provides an incentive to offer accurate advice to their clients or, at the very least, not to knowingly provide biased information.[13] Within financial institutions and professional organizations, conflicts of interest infrequently materialize in corrupt actions – the domain of enforcement; rather, biased advice is generally the result of unintentional and unconscious motivations.[14] The results of three comprehensive studies support these critical points and suggest a fundamentally different diagnosis of the underlying dynamics between financial advisers and their clients than the one centered on conflicted behavior advanced in the Paper.

- Using a unique set of data on Canadian financial advisers and their clients, a study shows that most advisers invest their personal portfolios just like they advise their clients, in line with their beliefs about their investment choices and own practices. Only a small fraction of advisers exhibited a conflicted behavior. The authors conclude that their "estimates suggest that correcting advisers' misguided beliefs, through screening or education, may reduce the cost of advice more than policies aimed at eliminating conflicts of interest."[15]

- A rigorous examination of the investment portfolios of Canadian households at three large Canadian financial institutions found that the composition of the advisers' portfolio

"is far and away the strongest predictor of the risk taken in their client's portfolios even after controlling for adviser and client characteristics."[16]

– A study of 401k plans in the United States reaches a similar conclusion: the composition of client 401k plans was similar to their financial adviser's plan.[17]

These findings indicate that most advisers give the advice they give not because they are influenced by conflicts of interest, but rather because they personally believe that their recommendations will outperform alternatives. Regulations attempting to "sterilize" the relationship by imposing a ban on embedded commission are more likely to prove ineffective because such a policy does not address the primary factor which is the financial advisers' beliefs about the value of the financial products they recommend … and acquire for their own portfolio. Thus, not only would such a policy miss the mark, its implementation would create a lot of collateral damage by hampering easy access to professional financial advice by a broad segment of financial consumers, a matter we address below.

The results of the studies mentioned above are consistent with those examining the influence of financial advice on wealth accumulation, which is not the case for those based on transactions and benchmark comparisons that form much of the substrate underlying the Paper's conclusions.[18] The Paper gives short shrift to the results of empirical studies that examine the impact of professional financial advice on the accumulation of financial wealth by households. This omission is regrettable because the findings are critical, particularly those that describe and measure the impact of financial advice over time on a wide range of financial households. This empirical evidence deserves to be emphasized since it makes no sense that it not inform public policies:

– In the United States, using the 2004 and the 2008 waves of the U.S. National Longitudinal Survey of Youth shows that financial advice has a strong positive impact on net worth and retirement savings (controlling for income earned in prior 14 years).[19]

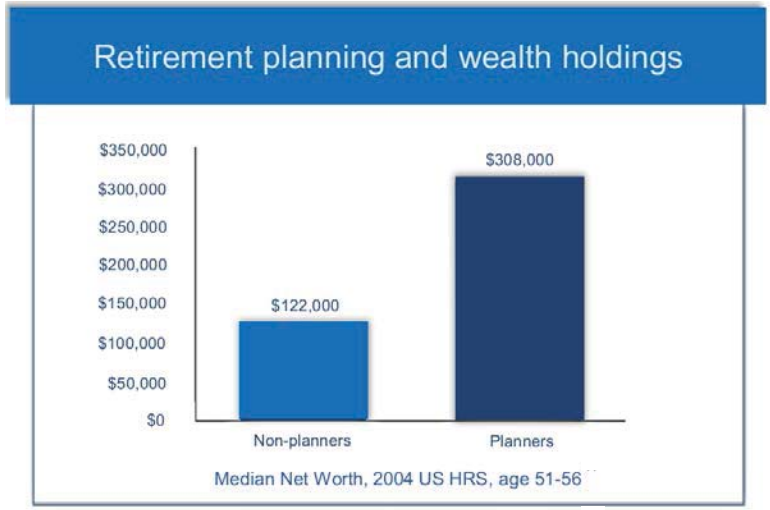
18 Care must be taken when comparing actual mutual fund performance to an index. Even if mutual funds did not charge expenses, their performance would still likely be different from the return on an index for a number of reasons. First, by purchasing and selling securities, they incur a transaction cost that reduces their return below that of an index. Second, funds need cash management policies to handle inflows and outflows from investors and policies regarding the timing of the reinvestment of dividends. Funds can choose their policies, while index returns are calculated based on a mechanical rule for reinvesting dividends and assuming no inflows or outflows. Third, funds can choose how they handle sales and purchases caused by changes in the companies contained in the benchmark index. Again, these changes are handled mechanically when calculating a return on an index. Fourth, funds need to have policies on how to handle tender offers and mergers while these are handled mechanically in index construction. Finally, funds can lend securities and earn a return on the securities that are lent; the index return cannot do so.

19 Terrance Martin and Michael Finke, *A Comparison of Retirement Strategies and Financial Planner Value*, Journal of Financial Planning 27, 11 (2014): 46-53.

- In another U.S.A. study, it was shown that households that used a financial adviser where five times more likely to have calculated their retirement needs, a key factor associated with much improved wealth holdings; and that those who knew their retirement needs saved significantly more than households without a plan and "generated more than 50 percent greater savings than those who estimated retirement needs on their own without the help of a planner."[20]



- In Canada, the results of a rigorous econometric study show that, on average, individual investors assisted by a financial adviser accumulated significantly more financial assets than did non-advised respondents with comparable age, income levels and other socio-economic characteristics. This benefit of financial advice grows with the length of time households have received advice: after four to six years, the advised households have accumulated 1.58 times the amount accumulated by non-advised households; after 15 years, the difference has increased to 3.9 times.[21]

- The converse also yields a major lesson. Looking at households that discontinued the use of a financial advice between 2010 and 2014, another study finds that they accumulated 45 percent less asset value than was the case for those who retained a financial adviser. Obviously, their decision to "go alone" proved costly.[22]

- The findings concerning the contribution of financial advisers to wealth accumulation by Canadian investors are congruent with those obtained in The Netherlands. Using the longitudinal data of about 16,000 Dutch individual investors over a 52-month period, the author found that the characteristics and portfolios of advised and self-directed investors differ remarkably: advisers add value through better diversification, lower idiosyncratic risk and reduced trading activity. The findings that financial advisers add positive value to portfolios are confirmed by the results of investors that switched from execution-only to advice.[23]

By providing insight into the underlying dynamics of the adviser-financial consumer relationship, the results of these studies suggest that strong countervailing factors, including the repeated-game nature of financial advisory services, are present to maintain the relationship fair and honest. These results also raise questions about the validity of the assertion often make in the

Paper that the Canadian market for financial advice is not efficient or that it would be made more efficient by a ban on embedded commissions by regulatory fiat.

TRUST: A KEY DETERMINANT OF THE DEMAND OF FINANCIAL ADVICE

The value of financial advice and its considerable effect on wealth accumulation by households who avail themselves of the service cannot be explained by asset performance alone. It stems from its ability to counterbalance human idiosyncrasie by instilling and encouraging more disciplined savings and investment behavior and better balanced and diversified portfolios. Examination of investment behavior in eight industrial countries reveals that wealthier households who generally work with a financial adviser "take more risks and earn higher average returns both through risk taking and through the form in which risk is taken."[24] Moreover, a large body of evidence shows that the capacity to plan for retirement is closely tied to working with an adviser.[25]

To be successful in influencing savings and investment practices, financial advisory services must take the form of a relational exchange imbued with a high degree of contextual understanding, not the transaction form implicit in the Paper. Compared to transactional exchanges, relational exchanges have a longer duration, a higher degree of contextual understanding and a stronger complement of trust, loyalty and cooperation. Results from the 2016 Natixis Global Survey of Individual Investors bear this out: investors want a strong and personalized relationship with their financial adviser – one that helps them "see beyond daily market noise, helps them refine personal goals, and helps them become stronger, more confident investors. What they want most is help with making more informed investment decisions."[26]

Several studies conclude that trust is a key determinant of the propensity to seek professional advice and plays an essential role in client-adviser relationships and financial decision-making. Surveys consistently find that retail investors cite "trust" as the most important determinant in seeking a financial adviser. Comparisons of the attitudes of individual investors who have or do not have a financial adviser show that:

i. the trust towards financial advisers is about 30 percent more likely for advised investors than a similar non-advised respondents;
ii. about 70.8 percent of advised investors have high confidence towards their financial adviser versus 31.2 percent for non-advised respondents with regard to financial advisers;
iii. the confidence of an advised investor that he or she will have enough money to retire comfortably is significantly higher than for non-advised investors, which is consistent with consumer survey findings that a large majority of investors (82 percent) credit their financial adviser with helping them achieve savings and sound investment habits.

The Paper is dismissive of the proposition that trust acts as a behavioral constraining mechanism in a principal-agent relationship and of the role of disclosure, the most commonly prescribed remedy to mitigate the risks stemming from "conflicted" situations arguing that in certain circumstances, this "solution" may have perverse effects (p. 80). It cites research that suggest that people generally do not discount advice from biased advisers as much as they should, even when advisers' conflicts of interest are disclosed, and that disclosure may increase the bias in advice because – caveat emptor – it provides the advisers with the moral licence to engage in self-interested behaviour, thereby exacerbating biases.[27] However, the Paper fails to mention subsequent studies published in the same academic journal showing that other institutional factors, including sanctions, can effectively mitigate these effects of disclosure![28] In this regard, the Paper also fails to consider the role and influence of Canadian securities legislation and case law that impose a statutory duty on retail client advisers to deal fairly, honestly and in good faith with their clients. These statutory obligations impose on financial advisers and registered firms a duty of care, which is comprised of "know your product" and "know your client" obligations, along with fair and reasonable compensation. The duty of loyalty encompasses the disclosure of the terms and conditions of the relationship and material conflicts of interest and their resolution in a manner consistent with the interest of the customer. These obligations are detailed in securities regulations and the self-regulatory organizations' requirements, including the extension of the duty of loyalty to the client beyond the initial purchase, sale or recommendation of any security that is unique to Canada.[29]

The implicit message one draws from the Paper is that the trust individual investors place in their financial adviser needs to be considered with caution because it is likely that individual investors "do not know better", a classic case of cognitive dissonance. A recent survey of U.S. financial consumers designed to identify the factors that lead to paying for professional financial advice and the type of services purchased showed that financial consumers who pay for comprehensive financial advice are predominantly middle-aged, college educated, financially knowledgeable and wealthy.[30] The Paper reports similar results for Canada: the great majority of investment fund owning mid-market (66 percent) and affluent households (72 percent) used an adviser (p. 29). These facts are inconsistent with the argument that the level of trust observed through the surveys arises because financial consumers are naturally trusting and credulous toward their financial adviser. Moreover, there are indications that advised investors do terminate a financial advisory relationship when they feel a disconnect with their adviser and the advice they receive. Surveys of financial consumers who have terminated an advisory relationship cite investment performance as the primary factor (41 percent), followed closely by two more telling factors: (i) failing to understand their savings and investment goals (32 percent) and (ii) investment views that differ from their adviser's (30 percent).[31]

The high levels of confidence, satisfaction and trust expressed by "advised" investors are the relevant indicators of the value they ascribe to their relationship with a financial adviser. The role of trust in reducing the incidence of self-serving behaviours and, as demonstrated by recent research, that it acts as mediating factor in the relation, need to be explicitly recognized.[32] This also makes it imperative that constant care be taken to ensure that investors' trust in a competent and professional financial advice industry is not misplaced. It remains that the effectiveness of policies designed to "maintain standards of professionalism that inspire consumer confidence and build trust" does not depend on the disallowance of embedded commissions.

THE MOST LIKELY IMPACT OF A REGULATORY BAN ON EMBEDDED COMMISSIONS

The success of Canadian households in accumulating substantially more wealth despite the costs associated with the management of individual accounts with the assistance of a financial adviser is critical to the effectiveness of voluntary retirement savings programs and the long-term performance and resilience of the Canadian retirement income system. Given the empirical evidence that individual investors relying on the support of financial advisers are, on average, more successful than non-advised investors in accumulating and managing their financial assets, and that the socio-economic benefits stemming from broad access to formal advice sources are considerable, a key question arises: Under what conditions are the supply of and demand for regulated financial advice most likely to be socially optimal?

THE PECULIAR ECONOMIC NATURE OF FINANCIAL ADVICE

Investment advisory services differ from consumer goods and services because they are abstract and there exists an asymmetric information discrepancy between the buyer and the seller, who is deemed to be a subject matter expert, whereas consumers are unable to evaluate confidently, even after repeated purchases, the quality and the reasonableness of the cost of the professional services they obtain. Are good financial returns the result of luck or of investment savvy? How confident can an investor be in the explanation that inactivity was the best strategy since he cannot distinguish "actively doing nothing" from "failing to do something"? The uncertainty is about the value and the quality of the services. In economic terms, financial advice falls within the category of "credence goods." This characteristic is precisely the crux of the matter: the information costs to evaluate "credence goods" are always significantly higher than for search ("normal") goods, often unbearably high.

The "credence good" nature of financial advice has significant consequences for consumer behaviour and, consequently, on the suppliers, the financial intermediary firms and the financial advisers in their employ. Individuals with higher education and income, financially sophisticated and with larger amounts of financial assets, exhibit a much greater demand for advice from financial intermediaries — a rational outcome given that, as a rule, they tend to be more financially literate and sophisticated and for them, the opportunity cost of abstinence is much higher — whereas individuals who are non-financially literate and non-affluent are reluctant to

[32] This attribute is observed in Canada, the United States and in recent European studies. See for instance, *Understanding the relationship between bank-customer relations, financial advisory services and saving behavior*, Cecilia Hermansson, Centre for Banking and Finance, KTH Royal Institute of Technology, Stockholm, 2015; Carlander, A. and Johansson, L.O., *Trust as a strategy to cope with uncertainty in delegated portfolio management*, MINEO; Jim Engle-Warwick, Diego Pulido, Marine de Montaignac, *Trust Ambiguity and Financial Decision-Making*, CIRANO, August 2016.

seek financial advice.[33] Their attitude reflects the fact that non-affluent households tend to equate financial advice with financial risk, which they avoid because they fear it. They will resist paying upfront fees for financial advice because they do not understand what working with a financial adviser entails and they are unable to discern the benefits, which are abstract, delayed in time and with an uncertain outcome. Viewed from their perspective, paying upfront for financial advice is equivalent to "locking in" a sure loss since they just can't fathom the benefits. This loss aversion is compounded by the fact that financial planning involves a long-term time frame. Even though it is generally accurate, the warning "past performance does not guarantee future results" that accompanies mutual funds and similar financial products can hardly be considered an unabashed encouragement to incur the upfront cost. Consumer surveys confirm these observations.

A survey of Australian retail investors found that a substantial proportion were not prepared to pay for advice more than 10 per cent of the annual cost of providing the service and, if this was not possible, they would forgo the advice. The Australian Securities and Investments Commission (ASIC) reports that "a common attitude was that financial advice was too expensive when there were no guaranteed returns."[34] In the United Kingdom, studies seeking to understand financial consumers' decision-making behaviour conclude that they are most reluctant to pay upfront for advice.[35] Delmas-Marsalet had obtained similar results in France.[36] A study involving retail investors from eight European countries found that between 26 to 30 per cent of respondents were unwilling to pay upfront for advice.[37] In Canada, even though 94 per cent of Canadian mutual fund investors agreed that they trust their advisers to give them sound advice and 90 per cent agreed that they obtain better returns than they would if investing on their own,[38] only 16 per cent indicated that they would continue their relationship with their financial adviser if a shift to a fee-for-advice regime resulted in an upfront cost to them. The observed idiosyncrasies of individual investors are remarkably similar between countries, which suggest that they reflect innate human proclivities.

The fundamental issue is not that individual investors do not value financial advice; rather, it is the reluctance of a large segment of the retail market to pay for it upfront that needs to be addressed. In so doing, financial consumers may be much more rational than what they are given credit for: the quality of the information provided is shown to be enhanced when the compensation is contingent over time rather than paid concurrently with the transaction.[39] The bundling of mutual funds with financial advice through embedded and trailing fees addresses this consumer reaction by establishing proportionality between the price of advice and the duration of the service.

■ INVESTORS REVEALED PREFERENCES AND NEEDS

In his 1996 American Finance Association Presidential address, Martin Gruber sought to resolve the puzzle as to why "actively managed mutual funds have grown so fast, when their

performance on average has been inferior to that of index funds."[40] His conclusions based on the empirical evidence he assembled were that "investors in actively managed mutual funds may have been more rational than we have assumed." This "puzzle" has since been examined through many lenses with head-scratching conclusions.

The puzzle remains mysterious until it is accepted that although all investors value higher net portfolio returns, a large proportion seek both financial advice and portfolio returns and that they are willing, within reasonable limits, to trade-off after-fee returns and financial advice and services to achieve their overall objectives. The heterogeneity of investors' behaviour is manifest.[41] In 2012 in Canada, 66 percent of investment fund owning mid-market households and 72 percent of affluent households used an adviser (p. 29). In the United States, 82 percent of U.S. households owning mutual funds have a financial adviser; in Germany, roughly 80 percent of individual investors rely on financial advice for investment decisions. In addition to the revealed preference of investors in Canada and abroad to invest in mutual funds through advice channels, there exists ample anecdotal evidence to support the point. This is a global phenomenon which warrants respect.

In retail markets, search costs can be onerous, if not in monetary terms at least in time spent for the task. In investment matters, the magnitude of search costs is blown-up since investors are confronted with a huge universe of investment options that extends beyond the capabilities of any one financial analyst, let alone an individual investor. The large proportion of mid-market and affluent financial consumers that retain a financial adviser makes it clear that they attach value to the information search and consolidation provided by financial advisers and to the emotional benefits stemming from the satisfaction and security of having and following a savings and wealth accumulation plan and the mitigation of psychic costs, such as anxiety over investment performance or retirement preparedness. Although it is difficult to quantify the monetary value of the intangible benefits of financial advice, they are nevertheless of paramount personal and societal importance. Surveys in Canada and the United States consistently show that more than 70 percent of adults "stressed about money at least some of the time" and half of them acknowledge that their concerns for their financial situation distracts them at work, resulting in disengagement, a higher rate of absenteeism and a lack of productivity.[42]

Other studies indicate that having a financial adviser increases the probability of a respondent declaring confidence in achieving a comfortable retirement by more than 13 percent relative to non-advised respondents.[43] Employee surveys report similar results: those who engage with a financial adviser have a significantly higher overall sense of financial well-being and are more likely to experience positive emotions about their finances.[44] These results strongly suggest that financial advice yields significant benefits not only for the advised households but for society as a whole.

THE IMPACT ON THE SUPPLY SIDE

The Paper suggest that competition in the "manufacturing" and "distribution" sectors of the Canadian fund industry is tame, unable to force the exit of sub-performance funds and exert effective pressure on price levels and practices.

The facts are that concentration and barriers to entry in the mutual fund industry have, to this date, being lower than in other sectors of the Canadian financial industry: investors can acquire mutual funds through several channels which are in robust competition, pricing within the industry is dispersed, market shares evolve over time, a strong indication that enough investors are sensitive to comparative returns net of fees to impact market positions. At the end of 2015, the financial planner/adviser channel "which had possessed the largest share of investment fund assets ten years ago, was still the second most important distribution channel at the end of 2015" (p. 33). This channel is comprised of the majority of independent mutual fund dealers and the one with the lowest participation of deposit-taker/insurer firms.

The Paper reports that in 2015, 78 percent of investment fund and fund wrap assets were held in deposit taker/insurance owned channels, a market share increase of 9 percent since 2005. Interestingly, the Paper does not appear to assign any influence to this high level of concentration, notably in the banking sector, on the pricing and remuneration practices in the fund industry it laments, choosing rather to blame embedded commissions as the main culprit. The Paper errs in its analysis; a ban on embedded commissions is most likely to compound the inefficiencies in the fund market and increase the cost of professional financial advice to retail consumers.

Another major development in the competitive landscape has been the introduction of exchange-traded funds (ETF) that are positioned as a direct substitute to mutual funds. Despite being touted in many fora as a superior savings vehicle with much lower financial intermediation costs, ETF's assets under management (AUM) represent less than 7.5 percent of the AUM managed by the Canadian mutual fund industry. This timid market penetration of ETFs in Canada corresponds to the shares of market observed at the global level and, therefore, cannot be attributed to the structure of the Canadian financial sector.

THE POLICY LEADS TO A SOCIETALLY INFERIOR INDUSTRY STRUCTURE

The typical industry response to the elimination of embedded commissions is a migration from a horizontal to a vertical industry structure dominated by a small number of firms that act as the distribution arm of the institution proprietary products. This is clearly what occurred in the United Kingdom where, following adoption of RDR, large asset managers and financial companies have expanded their direct sales forces and direct-to-financial-consumer offerings and actively promote their self-directed execution-only platforms. It is also important to note that the internalization of the sales force allows the "manufacturer" to continue the embedded commissions regime since the MiFID II Directive does not prevent financial advisers providing "tied" advice from receiving embedded commissions from the manufacturer.

The same development towards a vertical industry structure occurred through market forces in the United States. It is no coincidence that the large fund manufacturers in North America are at the forefront of the deployment of automated advisory services that provide retail investors (and financial advisers) with online access to investment advice at low cost.

The transformation of the financial advice industry from a horizontal to a vertical structure — from an environment where dealer firms and financial advisers have access to the financial products of several manufacturers to one where the industry is dominated by a small number of firms that act as the distribution arm of the institution's proprietary products — should be of particular concern to Canadian policy-makers for two major reasons.

Horizontal Structure	Vertical Structure
Promotes competition where strong financial product manufacturers compete to serve independent retail distributors.	In Canada, six banks control 90 percent of bank assets.
Diversity in the industry and access to several independent manufacturers exert pressure to: • enhance the range of choices available to financial advisers and their clients • improve the quality of the financial products/advice	A vertical setting: • limits the breadth of advice since financial advisers tend to recommend in-house products as a matter of course Empirical evidence suggests that funds sold through affiliated dealers perform worse.*
Better diversified portfolio.	Tendency to privilege bank deposits rather than higher yielding financial assets and encourage "reckless conservatism".

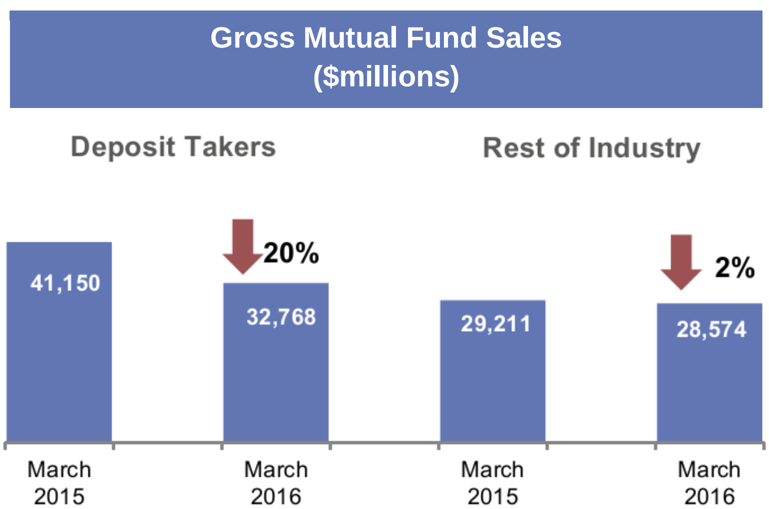
The first pertains to the breadth of advice provided in a captive setting. The Paper notes that "the majority of assets in the MFDA channel today are administered by dealers that focus on proprietary funds" (p. 35). In the branch network of deposit-taking institutions, fund distribution is solely that of proprietary funds. The evidence suggests that financial advisers at captive distribution firms are incentivized through several mechanisms to promote in-house products "regardless of the form of compensation."[45] Synovate finds that EU banks tend to recommend

[45] Edwin Weinstein, "Mutual Fund Fee Research" (The Brondesbury Group, 2015).

their proprietary products more than 80 per cent of the time.[46] A similar bias was documented in U.S. firms with proprietary funds.[47]

The second reason stems from the dysfunctional effects arising from a high level of concentration in an industry structured around a small number of vertically integrated financial organizations that manifest themselves through fund-flow patterns and fund-return performance.[48] In Canada, the process would accentuate the dominance of Canadian deposit-taking institutions. For the AMF in particular, one can only note the profound disconnect between its advocacy for a regulatory ban on embedded commissions and the consequences it would entail on the structure of the industry and its strategic orientation to "prioritize high impact initiatives for the growth and development of Québec's financial sector."[49]

A concentration of the funds industry around deposit-taking institutions would have far reaching consequences. Currently, one-third of financial wealth of Canadian households is held in deposits. Basel III incentivizes sales of daily interest accounts and GICs by deposit takers to manage capital requirements. This led to a disproportionate drop in bank mutual fund sales in the first quarter of 2016.



These results show that the assurances often repeated in the Paper that the CSA should be successful in reaching agreements with other Canadian regulators to avoid regulatory arbitrage between financial products and place IIROC and MFDA registered firms and representatives at a competitive disadvantage are of little comfort. The fact of the matter is that bank deposits and GICs issued by a chartered bank or by registered financial services cooperative are exempt from the application of most parts of securities law.[50] They also point to an important fact: the regulatory framework and financial performance pressures that apply on large financial corporations may lead to the implementation of internal policies that are not innocuous for

financial consumers nor in their long-term best interest as evidenced by the table above. The Paper is silent on this important matter.

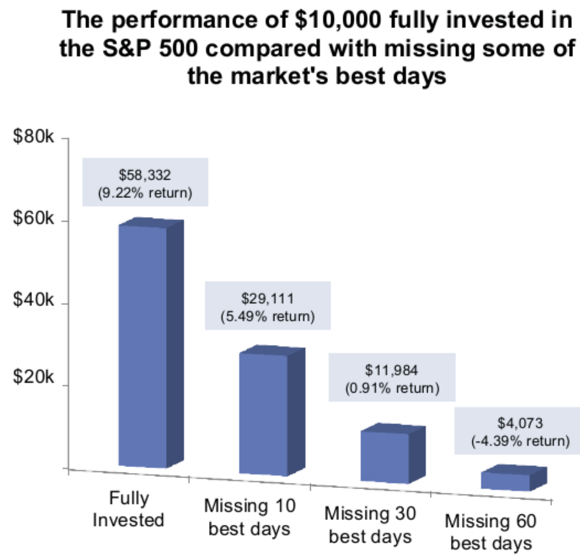
■ THE SOCIO-ECONOMIC CONSEQUENCES ON THE DEMAND SIDE

The "credence good" nature of financial advice incites a large proportion of financial consumers to shun the service. Deprived of the ability to use embedded commissions in their dealings with non-affluent households leads fund distribution firms to implement pricing policies calibrated to weed-out accounts that do not yield sufficient levels of continuous streams of revenues. The norm in the industry where embedded commissions have been discarded, either by regulatory fiat or market forces, is an AUM-based pricing model with a minimum asset threshold. It is estimated that in Canada this minimum asset threshold is about $150,000. In Canada, 80 percent of Canadian households own less than $100,000 in investable financial assets. It is noteworthy that 47 percent of them have an account with a financial advisor and that 69 percent of retail investors opened an account with a financial adviser when they had less than $50,000 in investible assets.

Canadian retail investor accounts per channel (2014)	
	Average Asset Value ($)
Canadian Banks	430,000
Small and mid-size mutual funds dealer	49,000
Branch-based mutual funds dealer	109,000
Independent full-service securities brokerages	169,000

Considering the average account value in the different channels shown above, it is difficult to believe that a ban on embedded commissions and the adoption of the AUM pricing regime that ensues will not "disfranchise" a large number of households. The most likely outcome is that, with a regulatory ban on embedded commissions, effective and practical options to access professional financial advice will be closed for a large number of middle-income households. Needing financial advice but lacking enough financial assets to make the provision of regulated financial advice an economic business proposition under a fee-for-advice or asset-under-management pricing model, they are most likely to be denied access to affordable financial advice and led to engage in financial transactions without the protections granted to investors dealing through a regulated financial adviser.

Left without professional financial advice, individual investors are prone to anchor decisions on known facts and make poor timing decisions. Empirical data suggest that poor timing decisions reduce annual returns by about 1.56 percent. [51] The response of U.S. individual investors to the 2007 recession differed significantly depending on whether or not they received professional financial advice and were impervious to their self-proclaimed financial knowledge. A study based on individual account data at a large independent financial services company found that: (i) an individual who paid for financial advice was 65 percent more likely to maintain long-term investment objectives, as measured by the decision to rebalance the portfolio but not moving into more of a cash position during the market downturn; and (ii) self-reported financial knowledge had little impact since only 5 percent of investors who were financially knowledgeable were more likely than those with low levels of financial knowledge to be prudent investor.[52] These findings are consistent with the results of a Canadian study that concludes that "sticking with an adviser induces more disciplined behavior during periods of market volatility."[53]



The bottom line is that "because investors are willing to tradeoff broker services and after-fee returns, it is welfare reducing to move investors with a revealed preference for interacting with brokers to lower-fee funds in the *direct* channel that lack these services and that it is not appropriate for a regulator to impose such an upheaval without an explicit legislative mandate."[54]

The assumptions contained in the Paper that the total cost of financial advice and financial products paid by retail investors will be reduced through the implementation of a ban on embedded commissions stretch credibility.

First, the suggestion that retail investors will be able to negotiate favorable pricing arrangements with their financial adviser because they now have detailed costing of the services rendered is unrealistic, except for very affluent individuals. Who believes that a retail investor with $150,000 in investable assets can bend the pricing grid established by a bank or an insurer or their affiliated broker/dealers? Supermarkets display the price of each product on their shelves; a very transparent market. This does not give consumers the power to negotiate prices at the check-out counter!

Second, industry-wide cost transparency is required to exert effective price competition and reduce price distortion. In retail markets, competitive pressure is exerted by the combined effect of consumers and competitors seemingly acting in concert in reaction to public information concerning the price and quality of services (or products) of a given firm. The supermarket

industry is a case in point, as was recently demonstrated with the entry of Walmart. Similarly, in the financial advice market, "supply-side competition through commissions adds efficiency" that benefits financial consumers.[55] Comparability is a necessary condition for market efficiency.

In the United States, the unbundled fee-based model is the rule for about 80 per cent of the gross sales of mutual funds to retail accounts. Since U.S. dealer firms distributing mutual funds pursue different pricing strategies and tend not to disclose publicly the actual charges they demand from their customers, detailed fund distribution costs (and fees) are not widely available, except for the portion paid through a 12b-1 fee. As a result, accurate comparisons of total cost of ownership between financial intermediaries inaccessible to individual investors and competing firms. We find a similar situation in the U.K. The RDR post-implementation review indicates that the price for retail investment products has been falling whereas the cost of financial advice increased. However, the evolution of the total cost could not be determined: "The ranges in pre — and post — RDR estimates of platform, product and adviser payments, and the various ways in which these feature in different investments, means it is not yet clear whether declines in product and platform prices are more of less offset by increases in advice costs."[56]

The market dynamics unleashed by a structural shift that separates the provision of financial advice from the sale of financial products tend to benefit financial intermediaries at the expense of individual investors.[57] The lack of industry-wide transparency on the total cost of ownership lessens scrutiny on fees and the market pressure to keep costs within the bounds robust competition would allow. U.S. broker-dealers acknowledge that their revenues generated in commission-based platforms are lower than in a fee-for-advice platform that incites them to promote AUM-based-fee relationships. Strategic Insight concludes that "in total, the unbundling of fees has resulted in an increase in the total shareholder costs for many mutual fund investors — with such increases amplified due to tax considerations at times."[58] The finding of Investor Economics concerning the evolution of the cost of ownership of mutual funds in the United States confirms Strategic Insight's conclusion "that a move to unbundled fee-for-advice models has not resulted in a reduction of investor costs of mutual fund ownership."[59]

The same occurred in the United Kingdom following the adoption of regulations imposing the fee-for-advice regime on the financial industry. In 2014, the average revenue generated per financial adviser amounted to £107,166 compared to £90,197 in 2012 with a corresponding increase in pre-tax gross margin at financial adviser firms. This increase occurred even though the average number of clients per adviser has not changed. Average pre-tax profits of financial adviser firms are higher than what they had been in the years prior to 2013.[60] Market pricing is now blurred, rendering it very cumbersome — if not impossible — to make comparisons between firms.

60 APFA, *The Advice Market*.

The Paper acknowledges "that a transition to direct pay arrangements would reduce the transparency of dealer compensation costs as investors would have no benchmark to help them assess the reasonableness of the fees they are paying for advice" (p. 79). However, the suggestion that this issue will be dealt with after the ban on embedded commission is implemented will only ensure that, if ever an effective industry-wide cost disclosure mechanism is put in place, the higher cost to retail investors that is sure to follow the ban will become the new floor. The apparent disregard for the critical importance of industry-wide cost transparency as an essential condition to ensure the efficient working of markets is a matter of concern.

■ CONCLUSION AND POLICY IMPLICATIONS

The fundamental role of the financial-intermediation function is to facilitate savings and promote sound financial asset management. The evidence strongly suggests that the functioning of the Canadian retail financial fund and advice industry has so far yielded beneficial results for households obtaining the service, and for society as a whole.

Under the current remuneration arrangements, access to and affordability of financial advice is increased, the advised population is much larger than would otherwise be the case under other remuneration models, the propensity to save is increased and the accumulation of wealth is enhanced through better saving habits and investment practices. While market risks and the moral hazard inherent to the principal-agent relationship are real, non-participation in financial markets and poor investor savings practices and investment decision-making have much larger negative impact on household wealth accumulation and society, in general.

Accordingly, the regulation of retail financial advice should aim at:

- Promoting easy and affordable access to professional financial advice by individual investors on terms that meet their expressed preferences;
- Strengthening consumer protection through full cost disclosure and timely performance reports to individual clients;
- Encouraging competition within the industry and market efficiency through the promotion of industry-wide price transparency;
- Emphasizing the need to achieve and maintain high levels of trust with regards to the financial advice industry, a key determinant of the demand for professional financial advice.

In the Canadian environment there is no evidence that a regulatory ban on embedded commissions will:

- Bring about the desired change in behavior;
- Broaden access to financial advice;
- Reduce or contain the cost of financial advice and, more generally,
- Help Canadians accumulate more wealth than would be the case otherwise; and,
- Assist retirees make an efficient draw-down of their wealth.

If the policy is adopted, the reverse is almost sure to be the case.

Québec, le 5 juin 2017

Objet : consultation sur l'abandon possible des commissions

À qui de droit,

C'est en tant que cliente que je m'adresse à vous.

Suite à une discussion avec mon représentant en fonds mutuels, j'ai été très étonnée de l'objectif des autorités règlementaires d'abolir les commissions. On dit que les représentants sont en conflit d'intérêts!!!! Alors, on dit quoi des banques et de Desjardins? Qu'ils travaillent pour les clients? Avec tout ce qui sort dans les informations présentement et de la pression que les conseillers ont à l'interne pour vendre leurs produits??

Comme cliente, j'ai connu 2008, 2011 et malgré tout, j'obtiens des rendements nets (tout compris) de plus de 8% / année…je sais très bien que, pour mon représentant, son salaire dépend de son volume. Alors, je n'ai absolument aucun problème avec le fait qu'il reçoive 1% en commission de suivi parce que sans lui, je ne pourrais pas faire ces rendements. Et même si ça m'en avait coûté 4%, il m'en reste encore 8%... Ce n'est certainement pas avec Desjardins, à 0,75% que je réussirais à m'enrichir! Comme cliente, ce qui m'intéresse c'est de savoir combien j'ai mis, combien ça vaut et c'est quoi le rendement de mon portefeuille!

De plus, il m'a clairement expliqué la différence entre commissions intégrées et honoraires. Pour moi, ça va me coûter plus cher à honoraires puisque je devrai m'ouvrir un compte autogéré, frais que je n'ai pas pour le moment puisque je n'en ai pas besoin.

Donc, de grâce, pourquoi toucher à un modèle qui fonctionne extrêmement bien? Si je veux avoir un portefeuille à honoraires, c'est avec lui que je vais régler ça! Je pense que comme client, nous avons un devoir de nous informer. Ce n'est pas aux autorités de nous dire quoi faire ni comment le faire! À chaque fois que je le rencontre, il me fait signer mes mises à jour, s'assure que tout respecte mes objectifs. Je sais qu'il a également un département de conformité au bureau qui le surveille de très près.

Pensez-vous sincèrement que tout va se régler avec les honoraires? Je pense sérieusement que ça vient mettre en péril des clients comme moi, qui ont réussis à mettre quelques dollars de côté, sans avoir des centaines de milliers de dollars, mais qui avec les années et les rendements obtenus, réussiront à envoyer leurs enfants à l'université et prendront une retraite un peu plus confortable. Pour y arriver, j'ai besoin de mon conseiller. S'il n'est pas capable de gagner sa vie à honoraires, est-ce qu'il va rester comme conseiller? Je ne veux certainement pas devenir une cliente des banques!

Je suis vraiment inquiète de ce qui s'en vient.

Prenez le temps d'écouter les clients puisque c'est nous qui serons les premiers impactés par cette décision, c'est nous qui en ferons les frais…

Julie Roy

Plaidoyer en faveur d'un accès aux conseils financiers indépendants pour TOUS, pas seulement pour les plus nantis

Mémoire présenté aux
Autorités canadiennes en valeurs mobilières

En réponse à la consultation
81-408 sur l'option d'abandonner les commissions intégrées

Présentation de l'auteur

L'auteur pratique dans le domaine du conseil financier aux particuliers depuis 1991. Dès l'obtention de son baccalauréat en Sciences Économiques de l'Université de Sherbrooke, il est embauché par la CIBC dans le programme de développement des Directeurs de succursales (BMT, Branch Management Training) et des Directeurs de comptes commerciaux. Après 30 mois, fatigué de l'impératif commercial de vendre uniquement les produits de la banque, il quitte la CIBC pour fonder son cabinet de services financiers indépendant.

Avec une équipe de quatre personnes, il sert aujourd'hui plus de 400 familles qui lui ont confié quelques 115 millions de dollars en placements. Une douzaine de conseillers se sont affiliés à son cabinet au fil des ans, certains ayant depuis pris leur retraite.

Toujours actif dans la communauté, il est occasionnellement demandé comme conférencier, notamment au ***Congrès 2008 de l'assurance et de l'investissement*** de Montréal, pour parler de l'intégrité dans la pratique du conseiller ainsi qu'en octobre 2015, à Dallas, lors d'un rassemblement de conseillers financiers canadiens, pour parler de MRCC2 et de la migration de sa clientèle vers une pratique à honoraires.

Membre de *l'Ordre des administrateurs agréés du Québec* depuis 1994, il y a occupé bénévolement bon nombre de postes, dont celui de président par intérim de l'Ordre en 2008. Il vient de terminer un mandat de président du comité d'inspection professionnelle de cet ordre.

En 2010 il est finaliste pour le prix « Excellence » de la *Chambre de sécurité financière*. En 2014, le *Conseil interprofessionnel du Québec* lui décerne la « Médaille Mérite » pour son implication dans le système professionnel du Québec, une très haute distinction.

Il dessert sa clientèle avec dévotion depuis 1994 auprès de *Services en placements PEAK inc.*, le plus grand courtier indépendant en épargnes collectives au Canada.

Sommaire exécutif

C'est avec un vif intérêt que je vous écris aujourd'hui pour vous apporter des éléments de réflexion sur l'abolition des conflits d'intérêts dans le conseil en épargnes collectives. Je suis extrêmement reconnaissant d'avoir été invité, comme les autres intervenants du marché, à réfléchir sur l'avenir de l'accessibilité au conseil financier indépendant, et de présenter le résultat de cette réflexion aux distingués membres appelés à se pencher sur la problématique. Les conclusions serviront certainement à améliorer l'encadrement législatif et vont véritablement transformer l'avenir du conseil au Canada. Je vous remercie pour cette opportunité.

La société évolue et cela pousse le conseiller à s'adapter, à se réinventer et à améliorer l'offre de services tant au niveau de la qualité que de la diversité. La compétition, désormais apportée par les nouvelles technologies, force à réagir pour que l'investisseur trouve ce dont il a besoin, et ce, à coût raisonnable. Parallèlement, les différents scandales financiers tant à l'étranger qu'au Canada ont marqué l'imaginaire collectif. Conséquence positive s'il en est, ils ont généré une meilleure sensibilisation de l'investisseur face au questionnement qu'il devrait avoir sur son conseiller financier, à ses objectifs, à la nature des investissements et stratégies retenues, ainsi qu'aux coûts reliés à ses choix.

La compétition favorise la réduction des coûts et cette réduction fut observée au courant des dernières années et, de façon plus intense, au courant des derniers mois. Les grands gestionnaires ont par exemple amorcé des processus de réduction de frais de gestion, que ce soit en réduction généralisée ou avec des mécanismes plus ou moins automatiques. Les nouvelles normes de divulgation des informations financières ont commencé à modifier les comportements des gestionnaires, des conseillers et des investisseurs, généralement pour le mieux.

Évidemment, comme dans toute profession, certains intervenants persistent à avoir des comportements jugés répréhensibles, ce qui renforce le besoin de légiférer pour protéger l'investisseur vulnérable. C'est cette infime minorité de mauvais intervenants qui attire l'attention et génère la mauvaise perception que la majorité agit de la sorte. Déjà, en janvier 1995, Gloria Stromberg[2] publiait son rapport qui posa les premiers véritables jalons visant à mieux encadrer la distribution des fonds communs de placement. Articulées autour de deux grands axes, soit « information et connaissances » ainsi qu'« intégrité et équité », ses recommandations ont donné lieu à l'arrivée du règlement 81-105, un premier pas règlementaire dans la bonne direction. Un des nombreux changements qui furent palpables fut l'abolition des « concours de ventes », toujours malheureusement présents du côté des produits d'investissement distribués par les assureurs et dans certains réseaux de distribution privés ou dits exclusifs. Nous sommes maintenant prêts pour une véritable refonte de cet encadrement, qui devrait s'étendre à l'ensemble des intervenants distribuant

[2] Gloria STROMBERG, *Regulatory Strategies for the Mid-'90s, Recommendations for Regulating Investment Funds in Canada*, janvier 1995.

leurs produits financiers, que ce soit par l'entremise d'un réseau privé ou par le réseau des conseillers indépendants. Que l'on prenne le problème par un bout ou l'autre de la lorgnette, la base des comportements répréhensibles réside à mon avis, dans le conflit d'intérêts.

Le rehaussement des obligations des conseillers envers l'investisseur est nécessaire ; l'abolition des conflits d'intérêts et des apparences de conflits d'intérêts est primordiale.

Je présente donc aujourd'hui six recommandations qui visent à éliminer le conflit d'intérêts dans notre industrie, tout en assurant une accessibilité aux services-conseils et en favorisant le renouvellement de la relève chez les conseillers. Chaque recommandation sera élaborée plus en détails dans les pages qui suivent. Ces recommandations visent à offrir une solution aux problèmes soulevés par la consultation actuelle et aux questions proposées. Je répondrai également à certaines questions du document 81-408 intitulé ***« Document de consultation 81-408 des ACVM – Consultation sur l'option d'abandonner les commissions intégrées »*** publié le 10 janvier 2017, qui m'interpellent plus que d'autres et pour lesquelles je crois pouvoir faire avancer la réflexion.

Recommandation No. 1 : *Abolition immédiate des frais de rachat différés (DSC)*. Ce mode de rémunération des conseillers est l'un des éléments responsable de l'augmentation fulgurante des sommes investies dans les fonds communs de placement au courant des 30 dernières années. Il n'y a pas eu que des inconvénients à avoir ce type de rémunération. Les défenseurs diront, avec raison, que l'obligation de garder l'investissement à long terme pour éviter des pénalités de retrait prématuré a permis d'éduquer l'investisseur sur l'importance de conserver un investissement à long terme pour en cueillir les fruits. Pour les petits investisseurs, il a également permis d'accéder à des services financiers personnalisés sans payer directement les coûts reliés à ces services. Conservés à terme, les fonds n'exigent aucune commission à l'investisseur. C'est le conseiller qui, en bout de piste, renonce à une rémunération récurrente annuelle plus importante au profit d'une rémunération immédiate équivalente, une fois les flux actualisés. Les nouveaux investissements faits selon ce modèle représentent désormais un peu moins de 10 % de ce qui est investi. Maintenant que l'investisseur est conscient des choix de placements qui lui sont offerts, ce mode de rémunération peut être aboli.

Recommandation No. 2 : *Maintien des frais de rachat différés réduits (LL) sous certaines balises.* Représentant une évolution relativement récente de la structure de commissionnement de type DSC, ce mode de rémunération permet une rémunération adéquate en fonction du travail exécuté, à coût raisonnable pour le client. Comme pour les DSC, les fonds distribués selon la structure de LL ne génèrent aucune pénalité pour le client, qui conserve son investissement pour une durée de deux ou trois ans, et la rémunération récurrente annuelle du conseiller est diminuée pendant la même période. Conserver ce type de rémunération permet de maintenir une bonne accessibilité aux services-conseils pour le petit investisseur tout en assurant la relève chez les conseillers financiers. Le maintien devrait cependant être fait sous certaines balises, comme l'illégalité de distribution pour les portefeuilles d'une certaine taille ou à certains investisseurs, tels que les personnes âgées qui ont une fenêtre d'investissement potentiellement plus courte.

Recommandation No. 3: *Abolition du conflit d'intérêts par la transformation des commissions de suivi en honoraires de services uniformes.* Un conflit d'intérêts souvent décrié, mais que plusieurs, dont le rédacteur du présent mémoire, considèrent comme étant une apparence de conflit d'intérêts plus qu'un véritable conflit (j'y reviendrai), peut être simplement aboli. La disparition du conflit ne passe pas nécessairement par l'abolition pure et simple de la rémunération. Cet objectif peut être atteint en uniformisant la rémunération d'un type de fonds à l'autre. Cette rémunération est à tort considérée comme une commission, alors que ce n'est pas le cas. C'est une rémunération récurrente qui perdure, tant et aussi longtemps que le client est satisfait des services. Ce n'est pas la résultante d'un processus de vente, c'est celui d'un service continu de qualité. En le remplaçant officiellement par un honoraire uniforme, que l'investisseur ait besoin selon son profil, d'un fonds d'actions, d'un fonds équilibré, ou d'un fonds d'obligations, ce choix n'aura aucune influence sur la rémunération du conseiller qui se retrouve sans conflit d'intérêts à l'intérieur de l'univers de fonds communs de placement.

Recommandation No. 4 : *Augmenter la transparence pour une meilleure prise de décision de l'investisseur.* La mise en place du *Modèle de Relation Client-Conseiller – Phase 2* (MRCC2) est un bon début, mais en matière de transparence, du point de vue de l'investisseur, c'est loin d'être idéal. Comment peut-on prétendre être transparent quand la plupart des frais de gestion payés par l'investisseur ne lui sont pas divulgués ? Pourquoi le commissionnement versé aux courtiers et conseillers est le seul montant qui doit être connu des clients ? Est-ce moins noble que les frais de gestion des gestionnaires et des frais d'exploitation ? Si notre industrie veut cesser de s'attirer les foudres justifiées de certains médias et de certains défenseurs des investisseurs, il est temps que nous appliquions une transparence COMPLÈTE des frais encourus pour assurer la gestion et le conseil et pas seulement d'un seul des intervenants. Afin d'obtenir le coût de gestion, les différents frais et les commissions versées, le client a en ce moment accès à l'information, mais il doit travailler fort et parcourir trois rapports différents. Que ce soit auprès d'une institution de dépôt ou auprès d'un courtier, le client devrait avoir toute cette information regroupée minimalement sur le relevé annuel.

Recommandation No. 5 : *Étendre la transparence des coûts de gestion à l'ensemble des véhicules de placements au Canada.* Il ne devrait pas y avoir de place dans notre industrie pour un conseiller désirant se soustraire de l'obligation de divulgation des coûts de gestion. Se réfugier dans la distribution de produits d'investissements émis par les assureurs, par les banques, par les fonds de travailleurs, par les bourses d'études ou par les associations sociales, ne devrait pas se faire au détriment d'un manque de divulgation à l'investisseur. MRCC2, ou sa version évoluée MRCC3 ou 4, devrait s'étendre à l'ensemble des investissements, contrats d'investissements pour un but spécifique ou général, structure d'investissement, portefeuilles de fonds, gestion groupée, etc. Il n'y a pas de gratuité dans notre domaine et l'illusion de gratuité doit être bannie. L'obligation de divulgation de tous les frais de gestion doit s'étendre à l'ensemble des intervenants, qu'ils soient des institutions de dépôt, des groupes intégrés, des courtiers, des conseillers ou des gestionnaires indépendants. On ne peut pas se permettre d'avoir deux poids, deux mesures, et tous devraient avoir l'obligation de transparence intégrale en ce qui a trait aux coûts de gestion. L'investisseur mérite cette honnêteté.

Recommandation No. 6 : ***<u>Prévoir une période d'implantation raisonnable.</u>*** L'arrivée de MRCC2 est une véritable révolution et nous ne pourrons mesurer véritablement ses effets que dans plusieurs années. Par exemple, de gros joueurs de l'industrie ont annoncé publiquement au courant de la dernière année qu'ils bannissaient les DSC, et d'autres ont pris la même décision sans faire grand bruit. D'autres décisions récemment prises par des grands gestionnaires telles que l'abaissement unilatérale des frais de gestion m'apparaissent également directement liée à l'implantation de MRCC2. À l'exception de ma recommandation No. 1, laissons donc quelques années avant d'initier de nouvelles réformes sans que « la poussière ne soit retombée » après la dernière vague de règlementations. Il m'apparait qu'une période de cinq à sept ans est souhaitable. À ce moment, tous les échéanciers de rachat différés seront terminés, bon nombre des conseillers agissant sous l'ancien modèle auront pris leur retraite et la nouvelle garde, fonctionnant sous un modèle plus moderne, présentera moins de résistance au changement.

Au cours des prochaines pages, je reprends ces recommandations avec une élaboration étendue.

Introduction

Il n'y a malheureusement, à ce jour, aucun système économique fonctionnant parfaitement. Le système capitaliste, loin d'être parfait, est cependant celui qui fonctionne le mieux parmi ce qui a été testé. Pour le conseil financier, plusieurs structures de rémunérations du conseil existent et aucune étude n'a pu démontrer à ce jour qu'une structure plus qu'une autre garantit toute absence de conflits ou apparences de conflits d'intérêts. Faire un choix de structure unique peut donc avoir des effets négatifs importants pour certains investisseurs et, en voulant bien faire, le législateur pourrait bien créer des dommages collatéraux plus importants que la situation imparfaite actuelle. Il est cependant clair pour moi qu'éliminer un choix de rémunération du conseiller ne devrait pas être l'idéal pour l'investisseur. Le choix éclairé facilite la prise de décision. L'absence de choix créé de la frustration et de l'insatisfaction chez le consommateur comme chez l'investisseur.

Certes, il est possible d'ajuster la structure de rémunération des conseillers pour limiter la présence de conflits d'intérêts, et c'est ce que j'entends vous proposer ici.

« Celui qui ne sait pas d'où il vient ne peut savoir où il va.»[3] Cette citation nous invite à nous rappeler qu'auparavant, la gestion de patrimoine était l'affaire des grandes fortunes, les petits et moyens investisseurs n'avaient en aucune manière accès à la gestion professionnelle et active. L'apparition des fonds communs de placement à capital variable a littéralement démocratisé la gestion de patrimoine, permettant l'accès à une répartition d'actifs sophistiquée pour le petit investisseur, et ce, à moindres coûts.

Pour augmenter l'actif sous gestion, certains gestionnaires ont développé leur propre réseau de conseillers pour solliciter les investisseurs. Plusieurs études, notamment la « Mutual Funds Fees Research » du Brondesbury Group[4], ont démontré que cette pratique génère un biais important et, en l'absence d'une rémunération uniforme entre produits dits « propriétaires » et les alternatives, le conflit d'intérêts peut être important. Pour rejoindre les investisseurs, plusieurs autres gestionnaires ont mis en place une structure de commissionnement à l'achat ou au rachat. C'est cette dernière qui apporte le plus de confusion auprès des investisseurs, car elle ne se manifeste qu'en cas de vente avant une certaine période plus ou moins longue. C'est donc parfois avec surprise que les investisseurs constatent sa présence, lorsqu'un décaissement est réalisé, parfois obligatoirement pour faire face à un imprévu.

Démoniser les commissions est facile à faire mais représente un raccourci intellectuel discutable. Sans leur existence, nous sommes en droit de penser que la

croissance de ce type d'épargnes aurait été passablement moins importante qu'elle n'a été; le petit investisseur, loin d'être habitué à rémunérer pour les services conseils, éprouve moins de réticence à investir lorsque la rémunération du conseiller est prise en charge par la structure financière. Lorsque les prix et conséquences de l'encaissement prématuré d'un investissement sont clairement expliquées, la prise de décision, dès l'investissement initial, est plus facile.

Réponses aux questions de la consultation

Questionnement No 1 - Expérience des investisseurs (questions 15, 17 et 25 du document 81-408): *Quel effet l'abolition des commissions intégrées aurait-il sur l'expérience des investisseurs et les résultats qu'ils obtiennent, plus particulièrement : Quel effet l'option considérée aurait-elle sur le coût et l'étendue des conseils fournis à des segments particuliers d'investisseurs ?*

Pour répondre à cette question, il est essentiel de définir ce qu'est une « commission ». C'est la résultante d'un processus de vente. Elle se matérialise pour le vendeur, une fois la « vente conclue », lorsque le client a accepté les termes du contrat. Cette acceptation survient généralement après qu'il y ait eu présentation des qualités d'un produit ou d'un service, des raisons qui soutiennent la recommandation au client, et après avoir répondu aux questions du client souvent également après avoir présenté une argumentation de vente. La commission est donc le résultat d'un événement ponctuel : la relation entre le vendeur et son client, concernant un produit ou un service.

Pour les services financiers, la rémunération qui est versée au conseiller pour son travail sur une période donnée comme un mois ou une année n'a rien à voir avec une commission. Ce n'est pas le résultat d'un processus de vente, c'est une rémunération présente tant et aussi longtemps que le client est satisfait du travail exécuté. Ce type de rémunération peut être versé directement par le client ou être intégré aux frais de gestion perçus par les gestionnaires. Dans le premier cas, la rémunération est qualifiée d'« honoraires » alors que dans le deuxième cas, cela devient soudainement des « commissions ». D'ailleurs, nous sommes un peu victimes d'une traduction étrange, où l'appellation anglo-saxonne des « *trailing fees* » (frais de suivis) devient en français, des « commissions de suivi ». En anglais, ce sont des frais mais en français, ce sont des commissions. J'ai personnellement toujours décrit ces revenus à mes clients comme étant ma rémunération récurrente pour m'occuper d'eux et je les ai toujours appelés « honoraires de suivi » ce qui correspond plus à ce qu'ils sont réellement. Cette rémunération variera en fonction de la performance du portefeuille : plus celle-ci est bonne, plus la rémunération du conseiller augmente et *a contrario*, elle diminue. Cela aligne les objectifs de l'investisseur et de son conseiller, désirant tous les deux avoir un portefeuille performant.

L'élimination de la rémunération intégrée aurait quel effet sur les coûts et les services offerts à certains investisseurs ? Ce serait particulièrement désastreux pour le petit investisseur qui pourrait se voir refuser l'accès aux services-conseils ou devoir payer un prix disproportionnellement élevé par rapport à un investisseur avec un portefeuille beaucoup plus élevé. C'est d'ailleurs ce qui s'est produit au Royaume-Uni après l'implantation de la *Retail Distribution Review – Phase 1* alors que le nombre de courtiers exigeant un compte d'investissement de plus de £100 000 (175 000 $) a plus que doublé.[5]

[5] HM Treasury & FCA, *FAMR – Financial Advice Market Review – Final report*, (mars 2016), p.19. https://www.fca.org.uk/publication/corporate/famr-final-report.pdf , (Page consultée le 31 mai 2017)

Dans la situation actuelle, il y a présence d'interfinancement des services par les investisseurs qui disposent d'un portefeuille imposant en faveur d'investisseurs moins fortunés. Cela s'apparente à une subvention pour assurer les services à une clientèle qui autrement, n'aurait pas les moyens de payer le coût réel du conseil financier. J'ai expliqué ce phénomène à mes clients depuis le début de ma pratique et je n'ai jamais reçu de critique, pas une seule fois. Les clients fortunés ont l'habitude de payer des impôts plus importants pour subventionner les services à la population ou de payer pour des services rendus à des membres de la famille qui n'en ont pas les moyens. Le service financier ne fait pas exception. Les conseillers acceptent dans leur clientèle les enfants ou les parents des clients fortunés compte tenu de la rémunération reçue pour la gestion du compte de ces derniers. Dans la collectivité des investisseurs d'un conseiller en particulier, cela assure que les détenteurs de « petits portefeuilles » recevront des services comparables aux investisseurs disposant de « grands portefeuilles ». C'est une forme de « payez au suivant ». La naissance des fonds communs de placement a créé cet interfinancement et a démocratisé la gestion privée autrefois réservée aux grandes fortunes.

L'élimination de la rémunération intégrée élimine l'interfinancement et pourrait donc résulter en une accessibilité réduite aux services professionnels pour les petits investisseurs, qui représentent 67 % des investisseurs canadiens[6]. Dans ma propre pratique, cette proportion est comparable. Le rapport Brondesbury abonde d'ailleurs dans le même sens : « …la fin des commissions présente le risque de créer deux catégories d'investisseurs, soit ceux qui peuvent se payer des services à honoraires, et ceux qui ne peuvent pas. »[7]

Qu'est-ce qu'un « petit portefeuille » ? Tout étant relatif, la réponse variera évidemment en fonction de l'évaluation que l'on fera de son propre portefeuille. Le montant de 100 000 $ est cependant généralement reconnu comme la frontière entre « petit » et « grand » portefeuille. Il est inquiétant de constater que chez certains courtiers appartenant à des banques, les conseillers qui servent leur clientèle dont le portefeuille est inférieur à 100 000 $ se voient pénalisés par la Direction du courtier ; le client paie pour les services mais le conseiller ne reçoit rien. Il est donc normal dans ce contexte que ces conseillers invitent ces clients à quitter sa clientèle. Dans le même groupe, certains courtiers « transfèrent » en succursale bancaire les clients ayant un portefeuille de moins de 250 000 $[8]. Les conseillers en succursale, ne disposant pas des mêmes ressources que leurs collègues œuvrant dans la division courtage, ne peuvent donc pas garantir la même qualité de services. Si l'on prend une facturation répandue de 1 % de l'actif sous gestion, on pourra donc comprendre que la rentabilité du service conseil pour la division de courtage se situe

[7] Jean-François PARENT, « La rémunération à commission crée des problèmes » dans CONSEILLER.CA, *Conseiller*, (25 juin 2015), http://www.conseiller.ca/nouvelles/la-remuneration-a-commission-cree-des-problemes-54198, (Page consultée le 31 mai 2017)

[8] Voir Annexes B et C pour des exemples parmi d'autres, le premier étant une lettre régulière d'avis de transfert, le deuxième étant une lettre recommandée annonçant la liquidation prochaine du compte, avec un impact fiscal (qui n'est pas souligné au client). Évidemment, la raison véritable n'est pas mentionnée au client. L'institution ne lui écrira jamais un commentaire du type « Étant donné que le solde de votre portefeuille est inférieur aux normes de notre entreprise… », il appert toutefois que c'est la raison véritable.

entre 1 000 $ et 2 500 $ par année. Le seuil de rentabilité pour un conseiller n'ayant pas les économies d'échelle du grand courtier doit donc être encore plus élevé. À elle seule, la comptabilité nécessaire pour facturer adéquatement l'investisseur coûte environ 200 $ annuellement par client. Ces coûts sont aujourd'hui assumés par les gestionnaires de portefeuille.

Le paiement pour le coût réel du service financier pour le petit investisseur deviendra donc prohibitif. Ces derniers risquent de devoir se résigner à prendre seuls leurs décisions ou à confier la gestion à une institution financière intégrée qui risque de privilégier les produits « maisons » au détriment des autres choix qui s'offrent présentement aux investisseurs. Cela ouvre par ailleurs la voie vers la tarification annuelle minimum fixe, qui devient disproportionnée dès que le portefeuille est trop « petit ».

L'objectif de vente fixé par l'employeur, un concept qui n'existe pas dans le monde des conseillers indépendants, demeure sans conteste la pire formule qui puisse exister pour mettre un conseiller en position de conflit d'intérêts.

En mars 2017, l'émission « ***Go Public*** » révélait que plus d'un millier d'employés et ex-employés bancaires lui avaient confié par écrit qu'ils subissaient, comme les employés du reportage initial diffusé le 6 mars, des pressions énormes pour vendre des produits de leurs employeurs, que les clients en aient besoin ou non. Certains conseillers ont déclaré qu'ils « …font n'importe quoi pour atteindre les objectifs déraisonnables… »[9], mentir par omission étant une tactique parmi d'autres. C'est une démonstration qu'il pourrait ne pas être dans le meilleur intérêt du petit investisseur de n'avoir autre choix que de confier leur patrimoine à une structure intégrée. Cela m'inquiète au plus haut point pour mes enfants, pour ma mère et pour tous les gens que je connais qui n'ont pas un portefeuille suffisant pour avoir le choix, si l'accès au conseil indépendant se tarit.

L'Institut des Fonds d'Investissement du Canada (IFIC) déclarait dans son communiqué du 30 juin 2016 que « des preuves de plus en plus nombreuses et solides en provenance du Royaume-Uni indiquent que l'abolition des commissions nuit aux investisseurs, car elle restreint l'accès aux conseils et entraîne une hausse des frais ».[10]

Les effets pour les petits investisseurs seraient donc importants, car l'accès aux services-conseils indépendants risque d'être fortement réduit ou les coûts de maintien des services risquent pour leur part, de connaître une augmentation substantielle. C'est un recul historique, un retour vers la gestion privée réservée à l'élite disposant d'importants capitaux.

[10] L'Institut des fonds d'investissement du Canada, « L'IFIC presse les organismes de réglementation à adopter une approche stratégique et fondée sur les faits à l'égard des réformes », (30 juin 2016) https://www.ific.ca/fr/news/ific-urges-regulators-to-adopt-a-strategic-fact-based-approach-to-reforms-french/, (Page consultée le 31 mai 2017)

Questionnement No 2. Risques d'arbitrages réglementaires (question 4.b du Document 81-408) : ***Quel serait le risque que des arbitrages réglementaires soient faits sur le marché dispensé si les commissions intégrées n'étaient abandonnées que pour les produits placés au moyen d'un prospectus ?***

Je suis d'avis que les risques sont très élevés que des conseillers désireux de conserver leurs revenus soient tentés de transférer leur portefeuille de fonds communs de placement dans une catégorie d'investissements où la réglementation est plus faible ou que la rémunération intégrée, directe ou indirecte, soit toujours présente. L'idée ici n'est pas de tenter d'éliminer la rémunération intégrée partout à la fois et de façon simultanée. Je doute qu'il soit possible d'atteindre cet objectif d'un coup. L'élimination de la rémunération intégrée dans les fonds communs de placement peut cependant créer des déplacements d'actifs qui ne sont pas à l'avantage du client.

Ces déplacements pourraient être en faveur des fonds distincts, offerts par les assureurs, où la conformité est minimale, la commission est similaire à l'actuelle rémunération des fonds communs de placement, et où la crainte d'un MRCC3 visant cette catégorie de placement n'est qu'un vague concept. J'ai malheureusement entendu plusieurs de mes collègues m'avouer qu'en réponse à MRCC2, ils travaillaient à convertir les portefeuilles de leur clientèle en fonds distincts, imaginez si les commissions intégrées disparaissent ! Les frais de gestion sont plus élevés pour les fonds distincts étant donné les spécificités du produit. C'est une augmentation d'environ 30 % des coûts payés par les clients. L'abolition de la rémunération intégrée générera une accélération de ce déplacement et la conséquence directe est une hausse des coûts de gestion pour les clients victimes de cet arbitrage réglementaire.

Ce type d'arbitrage pourrait se manifester également en faveur d'autres produits dont une rémunération est incluse à l'achat. La recommandation d'un type de placement pour un client ne devrait en aucune manière être la résultante de la présence ou non de commission. Je suis d'avis que l'abolition des commissions intégrées risque de générer ce genre de comportement de la part d'une certaine tranche de population des conseillers.

Questionnement No. 3 - Compensation de la perte d'un revenu stable pour les courtiers et représentants (question 24 du Document 81-408) : ***Les commissions intégrées, en particulier les commissions de suivis, procurent une source de revenus stables aux courtiers et aux représentants. Les mécanismes de rémunération directe compenseraient-ils la perte de ces revenus et les coûts associés à un tel changement ?***

Le questionnement No.1 met la table pour répondre au présent questionnement. Nous avons vu que certains clients verront une diminution de l'accès aux services ou que le coût de maintien des services s'en trouvera augmenté. Particulièrement pour les conseillers avec une pratique bien établie et importante, les mécanismes de rémunération directe, ou rémunération à honoraires, compenseraient à mon avis, la perte de la rémunération intégrée. Je crois que chaque conseiller réévaluera son modèle d'affaire et la clientèle desservie en appliquant le principe de Pareto[11]. Des choix difficiles devront être faits pour la survie de leur cabinet, telle qu'une réduction de clientèle pour assurer que les revenus de la clientèle fortunée couvrent adéquatement les frais fixes et variables des conseillers. Personnellement, j'ai 61 % de ma clientèle qui n'aurait pas les moyens de payer les coûts véritables des conseils, ce qui pourrait pour eux entrainer un arrêt de service résultant donc en une diminution des coûts d'exploitation de mon cabinet. Les coûts variables nécessaires pour servir la clientèle résiduelle étant forcément plus bas, la rémunération directe nette pourrait compenser et équivaloir les revenus nets actuels.

Cela se fera cependant au détriment des petits investisseurs qui devront quitter la pratique du conseiller.

Je considère avoir une clientèle de bonne taille et j'arriverai donc à modifier mon modèle d'affaire sans problème. Cette modification est d'ailleurs amorcée, car pratiquement toute ma clientèle « fortunée » est désormais sous le modèle à honoraires. Ce n'est malheureusement pas le cas de la plupart de mes collègues dont le portefeuille général moyen, selon plusieurs sources non-officielles, se situerait à environ 12 millions de dollars. Cela peut sonner le glas pour la carrière de ces conseillers et par conséquent, c'est l'ensemble de leurs clients qui devront se trouver un nouveau conseiller. Cela peut s'avérer être une tâche ardue si l'ensemble des conseillers « survivants » sont, durant la même période, dans un processus de « nettoyage » de leur propre clientèle.

D'ailleurs, selon une étude publiée en septembre 2016 par *Natixis Global Asset Management Canada*, au cours des trois prochaines années, 30 % des conseillers ont l'intention de radicalement changer en vendant leur volume d'affaires, en fusionnant avec une autre firme, en quittant le secteur financier entièrement ou en prenant leur retraite. Près d'un tiers (32 %) affirment qu'ils ne prendront plus de petits clients en raison des nouvelles réglementations.[12]

Rappelons que c'est ce qui s'est passé en Angleterre après l'élimination des commissions où ce sont plus de 23 % des conseillers qui auraient abandonné la pratique.[13]

---

[11] Le principe de Pareto ([Vilfredo Pareto, (1848 – 1923)] René ROY, « Pareto statisticien : la distribution des revenus », *Revue d'économie politique*, vol. 59, 1949, p. 555-577) est un phénomène empirique constaté dans plusieurs domaines, le nôtre n'y échappant pas : 80 % des clients génèrent 20 % des revenus.
[12] Business Wire, rapportant l'étude de Natixis Global Asset Management Canada, (29 septembre 2016), http://www.businesswire.com/news/home/20160929006170/fr/, (Page consultée le 31 mai 2017)
[13] HM Treasury & FCA, *FAMR – Financial Advice Market Review – Final report*, (mars 2016), p.17-18. https://www.fca.org.uk/publication/corporate/famr-final-report.pdf , (Page consultée le 31 mai 2017) Ce chiffre est probablement inférieur à la réalité car il présente le nombre de conseillers à une date déterminée sans tenir compte de la moyenne des conseillers qui sortent annuellement de la profession et de la moyenne des conseillers qui y font leur entrée. Cela signifie donc que pour la période étudiée, le nombre de conseillers effectuant leur entrée dans la profession n'a pas été suffisant pour freiner la diminution nette du nombre de conseillers. Nous pouvons donc aisément conclure que la proportion des conseillers quittant la profession est bien plus élevée que le 23 % observé.

Questionnement No 4. Carrière des représentants (question 26 du Document 81-408) : ***Quelles répercussions la proposition aura-t-elle sur les représentants et conseillers, en particulier sur ce qui suit : Le cheminement de carrière, le profil type de la personne intéressée par la profession, le recrutement, l'attrait relatif d'une carrière dans les services financiers ? À quels autres modèles de rémunération les représentants débutant dans le métier pourraient-ils avoir recours si les commissions intégrées étaient abandonnées ?***

Je ne crois pas que le profil type de la personne intéressée par la profession varierait. Ce n'est pas le type de rémunération qui nous définit. Je suis d'avis cependant que l'abolition des commissions créera une barrière à l'entrée importante, ce qui diminue passablement l'attrait pour la carrière.

Le modèle actuel permet au nouveau conseiller d'obtenir des mandats importants de conseils, car sa rémunération provient de la structure plutôt que du client directement. Il est peu probable qu'un jeune conseiller (ou nouveau conseiller, sans rapport avec son âge) arrive, dans son début de pratique, à convaincre un investisseur aisé à lui confier sa fortune contre rémunération directe, en dépit du peu de mois d'expérience que le conseiller lui offre. Le modèle actuel permet à ce conseiller d'offrir une gestion active et professionnelle par l'utilisation de fonds communs de placement, sans que son manque d'expérience ne soit un handicap à la performance du portefeuille. Sa rémunération, de la vue de l'investisseur, devient alors secondaire parce qu'elle est intégrée dans les résultats totaux.

Le conseiller débutant pourrait n'avoir d'autre choix que de se tourner vers une rémunération salariale dans une institution financière. La barrière à l'entrée demeurant toujours aussi élevée, le conseiller risque de demeurer à l'emploi de l'institution de façon permanente. Cela risque de créer un manque de relève important chez les conseillers indépendants et leur apporter un stress important et inutile pour les clients.

Questionnement No 5. Recherches de solutions (questions 12, 13 et 18 du Document 81-408) : ***…la proposition d'abandonner les commissions intégrées répondrait-elle aux trois principaux enjeux de protection des investisseurs et d'efficience du marché…? Pour répondre à ces préoccupations, les ACVM pourraient-elles prendre d'autres mesures que l'abandon des commissions intégrées, conjointement ou séparément ?***

Il n'y a pas à ma connaissance de recherches démontrant que la rémunération directement versée au conseiller par l'investisseur rend le conseil exempt de conflit d'intérêts. Il n'y a donc pas d'indication que la simple abolition de la rémunération intégrée viendrait solutionner le problème. La solution est ailleurs.

L'abolition du conflit d'intérêts est un combat noble et je m'inscris sur la liste des combattants depuis le début de ma pratique. J'ai personnellement, pour des raisons financières familiales, réussi à faire passer ma rémunération au second plan, et je comprends que dans l'ensemble de notre industrie, tous n'ont pas cette chance. Il y a cependant des façons autres que l'abolition de la rémunération intégrée pour éliminer le conflit d'intérêts.

Un conflit d'intérêts souvent décrié, mais que plusieurs considèrent comme étant une apparence de conflit d'intérêts plus qu'un conflit véritable, peut être simplement aboli. Il s'agit de la disparité de rémunération de suivi que les gestionnaires versent en fonction de la catégorie de fonds (un fonds d'actions vs un fonds équilibré ou un fonds obligataire). Techniquement, il est donc plus payant pour un conseiller de recommander un fonds d'actions plutôt qu'un fonds équilibré, car sa rémunération s'en trouve augmentée. Cette apparence de conflit d'intérêts qui se transforme en véritable conflit pour certains, peut être facilement éliminée en uniformisant la rémunération d'un type de fonds à l'autre. En remplaçant officiellement les « commissions de suivi » par un « honoraire uniforme de suivi », que l'investisseur ait besoin selon son profil, d'un fonds d'actions, d'un fonds équilibré ou d'un fonds d'obligations, ce choix n'aura aucune influence sur la rémunération du conseiller qui se retrouve sans conflit d'intérêts, à l'intérieur de l'univers des fonds communs de placement.

Je recommande donc d'abolir le conflit d'intérêts généré par la disparité de la rémunération de suivi selon le type de fonds, pour le remplacer par un taux unique et uniforme d'honoraires de suivi.

Je crois cependant que certaines rémunérations intégrées pourraient être mieux réglementées sinon complètement éliminées. C'est le cas notamment des commissions sur rachat différé (DSC)[14]. Ce mode de rémunération des conseillers est l'un des éléments responsables de l'augmentation fulgurante des sommes investies dans les fonds communs de placement au courant des 30 dernières années. Conservés à terme, les fonds achetés sous cette formule n'exigent aucune commission à l'investisseur. C'est le conseiller qui, en bout de piste, renonce à une rémunération récurrente annuelle plus importante au profit d'une rémunération immédiate équivalente, une fois les flux actualisés.

Il n'y a pas eu que des inconvénients à avoir ce type de rémunération. Les défenseurs diront avec raison que l'obligation de garder l'investissement à long terme pour éviter des pénalités de retrait prématuré a permis d'éduquer l'investisseur sur l'importance de conserver un investissement à long terme pour en cueillir les fruits. Il a également permis aux petits investisseurs d'accéder à des services financiers personnalisés sans payer directement les coûts reliés à ces services.

Les différentes études utilisées par les *Autorités canadiennes en valeurs mobilières* (ACVM) tendant à démontrer un manque de concordance entre le prix (via la rémunération intégrée) payé et le service reçu, mais elles ne se penchent généralement que sur l'action de recommandation d'un fonds ou d'un ensemble de fonds alors que le travail du conseiller est bien plus élaboré.

[14] De l'anglais « Differed Sales Charges », on voit également l'acronyme FRD pour « Frais de Rachat différés ».

Selon le sondage de Pollara pour le compte de l'IFIC[15], deux tiers des répondants (65 %) affirment recevoir d'autres services comme des conseils de budget, de planification en vue d'achats ou d'événements importants. C'est même réducteur que de croire qu'il n'y a pas de concordance entre la rémunération du conseiller et les services fournis. La recommandation finale d'investissement est la conclusion d'un processus par lequel le conseiller :

- valide la compréhension de l'investisseur sur les formes d'investissements et le fonctionnement d'un fonds commun de placement;
- mesure le profil de l'investisseur;
- explique les différentes relations que le conseiller a avec les intervenants (courtiers, gestionnaires, etc.), la rémunération qu'il recevra, la façon de porter plainte, etc.;
- conçoit une répartition d'actifs répondant au profil établi;
- effectue des recherches pour sélectionner les gestionnaires les plus performants qui deviennent candidats à la gestion d'une partie ou de l'ensemble du portefeuille du client;
- revoit le client pour lui recommander les différents fonds et lui expliquer les raisons qui ont généré tel ou tel choix;
- rempli, suite à l'obtention de l'accord du client, la documentation entourant la conformité du processus, notamment en complétant une fiche client (un document qui peut facilement compter une demi-douzaine de pages), une ouverture de compte, des formulaires de transfert d'une institution à l'autre, des formulaires d'ordres d'achats et selon les cas, d'autres formulaires;
- s'assure du traitement des documents et de la conformité des investissements par rapport à ce qui a été prévu;
- s'assure que des accès web soient ouverts pour que le client puisse suivre ses placements;
- explique la documentation, les confirmations, les relevés et les autres documents relatifs au portefeuille.

Par ailleurs, l'interfinancement des interventions du conseiller par la distribution de produits d'investissement, permet :

- d'accompagner le client dans l'établissement d'un bilan financier et d'un budget;
- d'établir un diagnostic financier;
- de soulever les incongruences dans la gestion de ses affaires personnelles et d'établir des pistes de solutions;
- d'élaborer un plan d'action avec le client pour optimiser la situation financière, fiscale et légale;
- d'élaborer une planification de la retraite;

---

[15] Pollara pour l'IFIC, *La perception des investisseurs canadiens quant aux fonds communs de placement et à l'industrie des fonds communs,* 2013, p.21. https://www.ific.ca/wp-content/uploads/2013/09/IFIC-Pollara-Investor-Survey-2013-FRENCH.pdf/4625/, (Page consultée le 31 mai 2017)

- de répondre aux questions du client face aux préoccupations qu'il peut avoir tout au long de l'année (il m'arrive de conseiller des clients sur le choix de location ou d'achat d'un véhicule);
- d'aider le client à relever certains défis de la vie, comme le financement des études, le mariage, la gestion financière du ménage dans le contexte de revenus fort différents, la prise ou non de la retraite, le divorce, la liquidation successorale d'un proche, etc.;
- d'effectuer un suivi du portefeuille de façon périodique;
- d'interagir avec les différents professionnels autour du client tels que les comptables, les notaires, les avocats, les fiscalistes, les courtiers d'assurances, etc.;
- d'assister le client dans la gestion de son régime complémentaire de pension le cas échéant;
- d'assister le client pour répondre à certaines demandes des autorités fiscales;
- et bien d'autres tâches nécessaires à l'accomplissement du mandat confié par le client.

Évidemment, dans cette liste non-exhaustive, nous pourrions ajouter l'énergie déployée :

- pour maintenir les connaissances du conseiller en assistant à des rencontres de gestionnaires;
- pour assurer une continuité du travail en cas de vacances ou de problèmes (maladie du conseiller, décès de celui-ci, incendie des locaux, etc.);
- pour offrir une équipe administrative de qualité;
- pour offrir un environnement de travail adéquat avec le client;
- pour respecter les obligations de conformité;
- etc.

L'investisseur qui n'a pas besoin de tels accompagnements peut faire ses choix d'investissement seul et procéder auprès de courtiers sans service en achetant des catégories de parts de fonds qui ne comportent pas de rémunération pour le conseil. À ce chapitre, la réglementation devrait être ajustée pour interdire à un courtier à escompte et sans conseil, le droit de distribuer des parts de fonds comportant une rémunération pour le service.

L'interfinancement est donc à deux niveaux dans notre domaine : entre les services offerts et les produits distribués d'une part et entre les investisseurs nantis et les autres. Cloisonner les services avec une rémunération en lien direct, ferait sans l'ombre d'un doute augmenter les coûts des services pour les petits investisseurs. L'investisseur nanti, généralement plus habile à négocier, utilisera de toute manière le poids de son portefeuille pour obtenir les services énumérés plus haut, sans payer à la carte, contrairement au petit investisseur qui n'a pas l'avantage dans la négociation de services. Cela se traduira, uniquement pour le petit investisseur, en une augmentation des frais pour obtenir les services dont il aura besoin.

Pour le petit investisseur, l'investissement dans les fonds communs de placement par l'entremise de parts de type DSC permet d'obtenir tous ces services, lorsque le besoin se manifeste.

À l'heure actuelle, ce mode de rémunération est de façon naturelle, en voie de disparition. Je l'ai personnellement abandonné pour n'utiliser que des parts à frais d'entrée (à frais d'acquisition, FA) dont les commissions sont établies à 0 %. Je ne facture aucune commission d'acquisition et me contente de l'honoraire de suivi pour mes clients, qui ne choisissent pas le mode de rémunération directe. Je ne facture aucune commission pour effectuer des transactions de modification de portefeuille. C'est une pratique largement répandue. D'ailleurs, un sondage non-exhaustif que j'ai mené auprès des différents gestionnaires impliqués dans les portefeuilles de mes clients m'a confirmé que je ne suis pas le seul à avoir pris ce tournant, puisque la proportion des nouveaux investissements dans les parts de type DSC ne représente même pas 10 % des nouveaux investissements en fonds communs de placements.

La plupart des courtiers appartenant à des banques ont interdit à leurs conseillers d'utiliser ce type de parts et des gestionnaires intégrés comme *Groupe Investors* et *SSQ* ont également supprimé ce type de parts, pour le remplacer par des parts versant des commissions au conseiller (comme le DSC régulier), mais avec une pénalité au conseiller si l'investisseur rachète avant l'échéancier établi. Cette dernière variation n'élimine cependant pas le conflit d'intérêts, car le conseiller pourrait être tenté de convaincre l'investisseur de ne pas faire de retrait (malgré une baisse des marchés ou pour rembourser une dette, par exemple), car le premier serait pénalisé.

Certains gestionnaires sans réseau captif de conseillers ont décidé récemment de ne plus offrir l'option DSC sur ses fonds, c'est le cas notamment de *Fonds Dynamique* et d'autres gestionnaires considèrent présentement cette option. Lorsqu'on se rappelle que cela ne représente pas 10 % de leurs nouvelles ventes, on comprend que la résistance au changement n'y est plus.

Les investisseurs sont bien mieux informés qu'il y a une trentaine d'année et sont maintenant plus conscients des choix de placements qui leur sont offert, ce mode de rémunération peut donc être aboli.

Je recommande donc l'abolition de l'émission de nouvelles parts à frais de rachats différés (DSC, FRD), immédiatement et sans qu'une période de transition ne soit établie pour cette abolition.

Une telle période de transition pourrait générer un « effet de course » où les conseillers qui ont déjà une propension à recommander ce type de fonds, pourraient « rouler » leur portefeuille pour générer une commission une dernière fois, et emprisonner leurs clients dans un échéancier de sept ans. Bien qu'on peut s'illusionner à l'effet que ce phénomène ne se produira pas, le risque est à mon avis loin d'être nul.

Les parts avec frais de rachats différés réduits (LL, FRR) représentent une évolution relativement récente de la structure de commissionnement de type DSC. Ce mode de rémunération permet une rémunération adéquate en fonction du travail exécuté, à coût raisonnable pour le client. Comme pour les DSC, les fonds distribués selon la structure de LL ne génèrent aucune pénalité pour le client qui conserve son investissement pour une durée de deux ou trois ans, et la rémunération récurrente annuelle du conseiller est diminuée pendant la même période.

Conserver ce type de rémunération permet de maintenir une bonne accessibilité aux services-conseils pour le petit investisseur et permet d'assurer la relève chez les conseillers financiers. Cela permet également, dans certains cas comme il m'est arrivé en mai dernier, de compenser une cliente pour les frais de liquidation d'un portefeuille d'investissement détenu chez un autre courtier. La cliente avait vu son compte être transféré dans une succursale bancaire parce que son portefeuille était passé sous la barre des 100 000 $.[16] Elle ne désirait pas cette situation qui lui était imposée par la firme de courtage et, en transférant le produit de la liquidation, avait eu à subir près de 2 000 $ de frais de courtage. Le rabais de commission nous permet de compenser les clients aux prises avec une situation semblable.

Évidemment, éliminer les DSC pour ne conserver que les LL représente à première vue une diminution de rémunération pour le conseiller, mais en réalité, il n'en est rien. Le versement d'une commission DSC et de la rémunération de suivi, 50 % inférieure à ce qui est versé pour des parts de type FA, est égale, une fois les flux actualisés, au versement d'une commission LL et de la rémunération de suivi qui double après l'échéancier de 2 ou 3 ans. Les parts de type LL, DSC ou FA sont tous intégrés dans la catégorie « A » des fonds, ce qui signifie que le coût pour le client investissant dans cette catégorie est le même qu'il choisisse un mode ou l'autre de rémunération du conseiller. À l'autre bout de la lorgnette, le conseiller, quel que soit le mode de rémunération intégré, touche en bout de piste le même montant. Il n'y a donc pas de raison de s'accrocher au mode de rémunération DSC, car les alternatives s'équivalent en ce qui a trait à la rémunération du conseiller.

La commission instantanée qui est versée au conseiller, particulièrement à ses débuts dans la pratique, contribue à assurer une relève dans le domaine en le rendant plus attrayant. En débutant dans la profession, le type de commission LL lui permet de vivre adéquatement tout en n'imposant pas au client un temps déraisonnable de détention. Pour le petit client, ce type de rémunération, qu'il n'a pas à verser directement, vient lui garantir un accès aux services connexes décrits plus haut. Au bout d'une période de 2 ou 3 ans, il n'y a plus de frais de rachat pour le client et la rémunération du conseiller revient à la normale.

Le maintien devrait cependant être fait sous certaines balises. Premièrement en uniformisant l'échéancier de rachat à 2 ans, on lance un message aux investisseurs qu'il est toujours préférable de maintenir ses investissements à « long terme ». Nous pourrions cependant limiter le droit d'investissement dans des parts à frais de rachat réduit aux investisseurs de moins de 70 ans, aux investisseurs de plus 30 ans et aux portefeuilles de moins de 100 000 $. Il faut s'assurer de protéger les investisseurs vulnérables qui peuvent

[16] Voir la lettre reproduite à l'Annexe A

avoir besoin de leur capital pour faire face à des besoins inévitables et immédiats, ou pour l'achat de leur première habitation.

Je recommande donc le maintien des frais de rachat différés réduits sous certaines balises, et de réglementer la période de rachat.

Préoccupations, répercussions possibles et conclusion

Si les ACVM décident d'aller de l'avant avec le projet réglementaire sur l'abandon des commissions intégrées, plusieurs préoccupations m'interpellent de manière importante.

Je l'ai mentionné à plusieurs reprises, tout comme plusieurs intervenants à ce jour, l'élimination de la rémunération intégrée risque de limiter l'accès aux services et d'augmenter les coûts pour les petits investisseurs. Déjà en 2013, l'IFIC signalait qu'aux États-Unis, le passage aux frais directs a entraîné une hausse des coûts pour de nombreux investisseurs.[17] Cela peut se traduire par une réduction du taux d'épargne des Canadiens. Déjà qu'avec une contribution annuelle moyenne au REER de moins de 3 000 $, nous ne pouvons croire que nous aurons une population de retraités bien nantis, si le taux d'épargne diminue, nous risquons de faire face collectivement à des défis sociaux importants.

Sous le prétexte d'une plus grande simplicité et d'une impression de gratuité du service, nous pourrions voir les ménages augmenter la concentration de leurs actifs auprès d'institutions de dépôt. D'ailleurs, Yves Bonneau, alors journaliste pour la revue *Conseiller*, déclarait dans son éditorial du 6 octobre 2016[18]: « *Il semble y avoir dans cette vision stratégique de l'encadrement un biais en faveur des grandes sociétés financières dicté par les lobbies, de même qu'un manque de respect pour le professionnalisme des conseillers.* ». C'est un sentiment largement répandu chez les conseillers indépendants. Si tel est le cas, à la lumière du reportage de ***Go Public*** qui a incité le gouvernement canadien à **ouvrir une enquête sur les pratiques commerciales trompeuses présumés des cinq plus grandes banques canadiennes**[19], nous ne pouvons être rassurés sur le sort des petits investisseurs après l'abolition de la rémunération intégrée. Considérant que la concentration des actifs au sein des banques canadiennes serait selon plusieurs à un niveau inégalé au monde, une augmentation de cette concentration ne peut pas être à l'avantage des investisseurs.

[19] Formulation utilisée par l'agence France-Presse de Montréal pour annoncer la décision du gouvernement d'ouvrir une enquête. http://www.lapresse.ca/le-soleil/affaires/actualite-economique/201703/15/01-5078988-enquete-canadienne-sur-les-pratiques-des-banques.php,(Page consultée le 31 mai 2017) et http://www.journaldemontreal.com/2017/03/15/enquete-du-gouvernement-sur-les-pratiques-des-banques, (Page consultée le 31 mai 2017)

D'ailleurs, en avril dernier, dans le cadre d'une réduction de frais de gestion pour bon nombre de ses fonds communs de placement, la Banque TD en a profité pour dissimuler une augmentation de sa rentabilité en manipulant le ratio de frais de gestion au détriment des conseillers. [20] Sans réglementation sur les frais de gestion, ce genre de comportement préoccupant risque de se répéter.

<u>Je recommande donc d'augmenter la transparence pour une meilleure prise de décision de l'investisseur.</u> La mise en place de MRCC2 est un bon début, mais en matière de transparence, du point de vue de l'investisseur, c'est loin d'être idéal. Comment peut-on prétendre être transparent lorsque la plupart des frais de gestion payés par l'investisseur ne lui sont pas divulgués ? Pourquoi seul le commissionnement versé aux courtiers et conseillers est le montant qui doit être connu des clients ? Est-ce moins noble que les frais de gestion des gestionnaires et des frais d'exploitation ? Si notre industrie veut cesser de s'attirer les foudres justifiées de certains médias et de certains défenseurs des investisseurs, il est impératif que nous appliquions une transparence COMPLÈTE des frais encourus pour assurer la gestion et le conseil, pas seulement d'un seul des intervenants. Présentement, l'information est disponible, mais le client doit travailler fort et parcourir trois rapports différents pour obtenir le coût de gestion, les différents frais et les commissions versées. Que ce soit auprès d'une institution de dépôt ou auprès d'un courtier, le client devrait avoir toute cette information regroupée, minimalement sur son relevé annuel.

Par ailleurs, nous ne devrions pas accepter l'interprétation créative que fait certaines institutions financières. S'il est vrai que dans le total des frais de gestion d'un fonds il y a une partie pour les transactions du gestionnaire, une partie pour rémunérer le gestionnaire et une partie pour le conseiller, je n'arrive pas à croire que l'on accepte que lorsqu'il s'agit d'un fonds commun de placement bancaire, la même logique ne s'applique pas. On parlera alors ici d'une absence de commission en travestissant en « partage de frais de gestion », ce qui est une commission versée à la succursale qui donne le service. Il m'apparaît inacceptable qu'un versement de commission devienne un partage de frais pour une institution de dépôt afin de se soustraire au traitement réglementaire réservé à la rémunération intégrée.

L'abolition de la rémunération intégrée, au lieu de donner naissance à un encadrement de la rémunération du conseiller, ouvrira la porte à une véritable jungle où le client qui mal renseigné, ayant peu de pouvoir de négociation ou négligeant dans son obligation de comparaisons des options, sera face à un coût de gestion total[21] fort variable d'un conseiller à l'autre, pour le même bouquet de services. Nous pourrions par ailleurs assister à l'utilisation de forfaits de services groupés pour lequel le client paiera, sans toutefois tous les utiliser. Cela est comparable aux forfaits déraisonnables des distributeurs de signaux de télévision qui a forcé le CRTC à intervenir et à légiférer sur le service de base et les choix à la carte.

---

[20] Didier BERT, « *TD : des gains sur le dos des conseillers ? »,* dans CONSEILLER.CA, *Conseiller*, (25 mai 2017) http://www.conseiller.ca/nouvelles/commissions-la-td-a-t-elle-hausse-sa-part-au-detriment-des-conseillers-62730?utm_source=EmailConseiller&utm_medium=email&utm_campaign=Breaking_News) ,(Page consultée le 31 mai 2017)

[21] Le coût de gestion total est la somme des frais de gestion, d'opérations, d'honoraires versés au conseiller et les taxes applicables.

Pour le conseiller incapable d'adapter sa pratique à cette nouvelle interdiction envisagée, le risque d'arbitrage est important. Nous pourrions observer un confinement des petits investisseurs dans les fonds distincts, car l'iniquité des règlements pourrait faire migrer les recommandations de certains conseillers vers les fonds distincts, ce qui se traduirait par une augmentation des coûts de gestion qui sont plus élevés dans les fonds distincts. ***Je recommande donc d'étendre la transparence des coûts de gestion à l'ensemble des véhicules de placements au Canada.*** Il ne devrait pas y avoir de place dans notre industrie pour un conseiller désireux de se soustraire de l'obligation de divulgation des coûts de gestion. Se réfugier dans la distribution de produits d'investissements émis par les assureurs, les banques, les fonds de travailleurs, les bourses d'études ou les associations sociales ne devrait pas se faire au détriment d'un manque de divulgation à l'investisseur. MRCC2, ou sa version évoluée MRCC3 ou 4, devrait s'étendre à l'ensemble des investissements, de contrats d'investissements pour un but spécifique ou général, de structure d'investissement, de portefeuilles de fonds, de gestion groupée, etc. On ne peut pas se permettre d'avoir deux poids, deux mesures, et tous devraient avoir l'obligation de transparence intégrale à ce qui a trait aux coûts de gestion. L'investisseur mérite cette honnêteté.

Le droit au libre choix

Nous vivons dans une société où le droit au libre choix est une valeur fondamentale. C'est le principe même de la démocratie, et la population chérit ce droit pour plusieurs services, que ce soit pour la santé, la scolarité de ses enfants, les politiciens qui la gouvernent et évidemment, la foule de fournisseurs de services, dont les institutions financières et les conseillers.

Plusieurs choisiront de confier leur avenir financier au soin des institutions de dépôt, nous l'avons vu par les études présentées dans le document de consultation 81-408, et un nombre en croissance d'investisseurs, choisissent les conseillers opérant à l'extérieur d'une structure intégrée.[22]

Je suis d'avis qu'on ne peut enlever ce droit aux investisseurs, particulièrement pour les moins nantis. L'abolition de la rémunération intégrée pourrait avoir comme conséquence, la disparition de ce choix. Les conseillers « survivants » pourraient augmenter la quantité d'actifs nécessaires pour pouvoir travailler avec les clients, ce qui laisserait certains investisseurs à l'écart, sans autre choix que de se réfugier auprès d'une institution de dépôt.

Présentement, le choix existe pour la rémunération du conseiller : une rémunération de suivi intégrée ou un paiement direct. J'ai personnellement une pratique à rémunération hybride, où une partie repose sur une rémunération directe et une partie sur une rémunération intégrée. D'ailleurs, la population est partagée sur la rémunération préférée,

[22] Investor Économics Household Balance Sheet 2016

si on se fie au sondage de Pollara conduit en 2013[23], qui a entre autre révélé que la majorité des Canadiens préfèrent les commissions aux honoraires. Ainsi, 51 % des épargnants préfèrent les frais intégrés aux placements, alors que 41 % préfèrent une rémunération directe. Je ne peux envisager comment la disparition de ce droit de choisir peut être perçue par le législateur comme une bonne chose.

Mis à part mes recommandations d'élimination des nouvelles parts souscrites sous le modèle DSC et le nivellement des honoraires de suivi intégrés aux frais de gestion, je suis d'avis que nous devrions laisser l'implantation de MRCC2 faire son œuvre avant de lancer une nouvelle vague de règlementations. L'arrivée de MRCC2 est une véritable révolution et nous ne pourrons mesurer véritablement ses effets que dans plusieurs années. Par exemple, de gros joueurs de l'industrie ont annoncé publiquement, au courant de la dernière année, qu'ils bannissaient les DSC, tandis que d'autres ont pris la même décision sans faire grand bruit. D'autres décisions récemment prises par des grands gestionnaires telles que l'abaissement unilatérale des frais de gestion m'apparaissent également directement liée à l'implantation de MRCC2. MRCC2 génère par ailleurs, une recherche d'information de la part des investisseurs, une guerre de prix des gestionnaires et un comportement plus sain des conseillers. Les impacts sont déjà palpables et nous ne pourrons voir avant plusieurs années l'étendue complète des effets générés, bons ou mauvais.

Je recommande donc d'attendre quelques années avant d'initier de nouvelles réformes sans que « la poussière ne soit retombée » après la dernière vague de règlementations. Il m'apparait qu'une période de cinq à sept ans serait souhaitable. À ce moment, tous les échéanciers de rachat différés seront terminés ; bon nombre des conseillers agissant sous l'ancien modèle auront pris leur retraite et la nouvelle garde, fonctionnant sous un modèle plus moderne, présentera moins de résistance au changement.

Si l'option d'abandon des commissions intégrées est retenue, je suis d'avis que nous pourrions dès maintenant éliminer les nouveaux DSC, conserver les LL sous certaines balises et possiblement avec pénalités au conseiller plutôt qu'au client en cas de rachat prématuré, tout en limitant l'interdiction aux nouveaux investissements. Les comptes actuels continueraient à comporter une rémunération intégrée alors que les nouveaux investissements pourraient s'effectuer sous le mode de rémunération directe. Ainsi, à l'intérieur d'une génération, nous aurons fait une transition en douceur, pour le bien des investisseurs et de la collectivité.

Comme le risque zéro, l'absence totale de conflits d'intérêts en matière de conseils financiers est une utopie. Au mieux, nous pouvons et devons être conscients de la présence du conflit d'intérêts, le déclarer au client et limiter les actions y menant. Augmentons les responsabilités des conseillers en la matière et légiférons pour qu'agir dans le meilleur intérêt du client ne soit pas qu'un simple concept philosophique et déontologique, mais bien une obligation légale. Obligeons tous les intervenants à déclarer l'ensemble des situations où il y a ne serait-ce qu'une apparence de conflit d'intérêts.

[23] Pollara pour l'IFIC, *La perception des investisseurs canadiens quant aux fonds communs de placement et à l'industrie des fonds communs,* 2013, p.33. https://www.ific.ca/wp-content/uploads/2013/09/IFIC-Pollara-Investor-Survey-2013-FRENCH.pdf/4625/, (Page consultée le 31 mai 2017)

Je l'ai recommandé plus haut, en nivelant les honoraires de suivi intégrés, nous éliminons presque totalement le conflit d'intérêts dans l'univers des fonds communs de placement.

Lorsque bien expliqués, les frais de gestion intégrés sont facilement acceptés par les investisseurs, petits et grands.[24]Une plus grande transparence, étendue à l'ensemble des intervenants, favorisera une meilleure littératie financière tel qu'il est souhaité par les gouvernements.

N'annihilons pas l'évolution réalisée par le petit investisseur au courant du dernier siècle, ne lui enlevons pas le droit de choisir avec qui il fait affaire et comment il le rémunère. Protégeons-le contre les comportements répréhensibles commis par les individus et par les entreprises. Informons-le adéquatement et totalement, en toute transparence.

L'abolition pure et simple du financement de ses services financiers par une rémunération intégrée aux frais de gestion lui enlèvera ses choix, le limitera dans ses actions et n'éliminera pas le conflit d'intérêts dont il peut être victime.

Nous sommes des professionnels responsables, nous avons entre autres la responsabilité de rendre accessible les services-conseils financiers à TOUS, pas seulement aux plus nantis de la société.

Cher Ca[redacted]
Numéro de compte: **69[redacted]**

Nous souhaitons vous informer que nous avons confié votre compte aux bons soins d'une équipe dévouée de la succursale nationale qui continuera à répondre à vos besoins de placement.

Octave Tetiali, Nathaniel Brown et **Marie Noel**, votre nouvelle équipe de conseillers, sont impatients de vous servir. Ils communiqueront avec vous pour revoir vos objectifs de placement, votre tolérance au risque et discuter de votre portefeuille. Ils pourront alors vérifier que vos placements s'harmonisent avec vos objectifs financiers.

Soyez assuré(e) qu'aucune autre modification n'a été apportée à votre compte, à l'exception du changement de votre équipe de conseillers. Je vous invite à communiquer avec moi si vous avez des questions ou des inquiétudes concernant votre portefeuille, ou encore, si vous avez des transactions à effectuer, des changements d'adresse ou tout autre élément à nous signaler avant que nous prenions contact avec vous. Vous pouvez nous joindre au **1-877-388-6330.**

Vous êtes un client important pour nous. Nous sommes heureux de vous être utile et de continuer à vous aider à atteindre vos objectifs financiers.

Veuillez agréer, Madame / Monsieur, nos sincères salutations.

Sincerely,

Aaron Stoker
Branch Manager

Lettre de liquidation d'un compte devenu trop « petit » pour poursuivre les services

BLC
SERVICES FINANCIERS

Montréal, 16 mai 2017 **ACTION IMMÉDIATE REQUISE**

[redacted]

Objet : Fermeture de votre compte BLC Services financiers inc. - N°018[redacted]

Monsieur,

En juillet et septembre dernier, vous avez reçu deux lettres vous informant de changements importants concernant votre compte BLC Services financiers inc. (BLCSF). Le type de compte que vous détenez n'est plus disponible chez BLCSF puisqu'il ne vous permet pas de tirer profit de services complets en matière d'investissement. Dans les précédentes lettres, nous vous avons proposé de transférer votre compte vers notre fournisseur de services B2B Banque Services financiers inc. (B2BBSFI), à qui nous avons confié l'administration de l'ensemble de nos comptes d'investissement en novembre dernier.

Comme nous n'avons pas reçu de réponse de votre part, nous comprenons que cette option ne vous convient pas. Afin de régulariser la situation, nous vous demandons de bien vouloir signer le formulaire joint à la présente lettre afin de retirer les fonds que vous détenez dans ce compte et de procéder à la fermeture de ce dernier. Un chèque sera ensuite envoyé à l'adresse demandée.

Afin de nous permettre de traiter vos instructions, vous devez faire certifier votre signature par votre institution financière ou un commissaire à l'assermentation et nous retourner le formulaire dans l'enveloppe préaffranchie ci-jointe. Veuillez prendre note qu'il est de votre responsabilité de vous informer de l'impact fiscal de vos transactions.

Nous vous remercions de votre confiance et vous prions d'agréer, Monsieur, nos plus cordiales salutations.

La Direction de BLC Services financiers inc.

June 6, 2017

I consider myself one of the good guys. As per page 95 of the CSA consultation paper, I am making this submission on my own behalf. This September I will have been working for a mutual fund dealer for exactly 20 years. I also have been licensed to do life and disability insurance for most of that time. I graduated from the University of Alberta with a B.Comm in finance prior to financial advising. When I started, my wife, who is a medical doctor, and I decided I would work at home. We knew this would mean less income for us but since I have been able to be there for our daughters since birth, it has been worth it. Presently, I drive our daughters to gymnastics and dance, two of my many many obligations to them.

This letter will explain how I have run my financial advising practice and to give you several alternatives to banning embedded commissions, which I consider an unnecessary action that will hurt the small investor. I find the CSA consultation paper deficient in many ways which I will explain in the context of your main issues regarding embedded compensation. I will also suggest several regulations that will ensure investor interests are aligned with adviser and fund manager interests.

Issue 1 of CSA consultation paper - Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors.

I find the exact opposite in my practice. Since day one, I have always explained to each investor most of the information contained in the fund facts documents. I would sit with them and go through a prospectus (remember those) detailing how much I was paid, how DSC fees work, etc. Since I competed in the Olympics for curling, much of my client base comes from the curling community. I didn't want anyone to say I didn't disclose information about fees etc. I was very careful about this because a bad reputation would spread like wildfire in the curling network. I have always told my clients I will only deal with mutual funds and mutual fund companies that pay me exactly the same way and the vast majority do, so I have many options. When I buy a DSC fund, I have told clients I will only pick companies that pay 4.9% like Fidelity or 5% like

C.I. I have told them for every $1,000 invested this gives me $49 or $50. The difference is not enough to make me choose Fidelity over C.I. or vise versa or over anyone else. This means I will choose what is best for investors. This has given me an idea for a good regulation that will protect investors in this regard. Make the maximum DSC paid 5%. This way mutual fund companies can compete by reducing DSC but not increasing it. This will work for all forms of DSC. Another good regulation regarding DSC would be to put a maximum investment amount per household that can go into DSC. I have told my clients that once they invest $100,000, I will put all future purchases into FEL at no-load. This should be easy to maintain for compliance with our technology in databases. This is what makes it worthwhile to take the small investor. Also, I will only choose mutual fund companies that have a 6 or 7 year redemption fee schedule and the redemption fee has to be in line with the general practice in the industry. This leads to another good regulation. Since plenty of mutual fund companies have operated just fine on a 6 year schedule, make the maximum DSC schedule 6 years at the general market rate (to be determined) for redemption fees. You can find good average values for other load types, low load, etc. DSCs are far from perfect but at least an investor can get some money quickly in an emergency. Regulations such as these will only allow mutual fund companies to compete on performance which it should. Regulations SHOULD be there to take other incentives out of the hands of mutual fund companies to give to advisers. The focus on performance simply will align the goals of the mutual fund company, the adviser, and obviously, the investor.

One more thing: DSCs allow investors to put more into RRSPs which the small investor has trouble maximizing. I would rather put $10,000 in my RRSP and get a tax deduction on that amount rather than put $10,000 less my account fee in. RRSPs are not generally considered emergency money and therefore the DSC schedule is likely to get to 0% before the money is withdrawn especially after the majority of the portfolio is load free. That money gets withdrawn first.

This brings us to trailing commissions. When I started, the vast majority of trails, DSC and FEL, were about 0.5%. Of course that has changed to DSC at 0.5% and FEL to 1%. I have told my clients that I will only deal with mutual funds and fund companies that give a 1% trailer on FEL and 0.5% trailer on DSC. Again, a good regulation would be to make these amounts the maximum a mutual fund can pay so the mutual fund companies can compete on paying less but not more. One more note: I have told my clients that money market funds can pay less on the trailers and no DSC in some cases and these funds are generally seen as a short term investment with capital preservation so if they need this I can provide it. Other than the money market fund, I have told my clients from day one that no matter which mutual fund company I pick, fund company A, B. or C, I do not get paid any differently, I also do not get paid any differently no matter what risk level I pick. Therefore my only goal is to pick funds that will maximize client return for their individual risk level. If you use my suggested regulations, all advisers under this compensation model will act in this fashion. Fund managers will have no alternative but to make fund performance their top priority and advisers will migrate to the funds with proven fund managers.

One quick bit on the 10% free rule. I do this every year for my clients so they can have more load-free money in an emergency. The 10% free should not be a use it or lose it proposition but after 3 years you should have approximately 30% of your money available to you at no load.

This leads me to a discussion on mutual fund MERs. Being one of the good guys, I carry around the fund facts for the Brickburn Income Growth Class Fund. Its MER, as of April 30, 2014, is a whopping 6.11%. Wow!!! I show this to my clients because it lists my trailer fee as 1%. Again, I tell my clients I will only deal with funds that pay me the same trailer of 1%. Obviously, I would never pick this fund for a client. I tell them I look for funds that get as close as possible to a 2% MER and rarely go over a 2.5% MER, some managed ETF funds I buy are less than 2%. I am being the paid the same so why wouldn't I shop around for a lower MER? I want to keep my clients so I will do anything to increase the probability of good performance. There are plenty of excellent fund managers at this level so there is no need to go for a higher MER IF FUND FEES ARE TAKEN OUT OF THE ADVISER'S HANDS. The only thing that shocks me about Brickburn is they don't increase trails to advisers in an attempt to have advisers put their interests above the clients. With a MER over 6% they certainly should be able to afford that. If you put fees in adviser hands I think there will be more unethical adviser activity. Again, no matter which adviser compensation model you choose, there will be a small percentage of unethical advisers and clients will be taken advantage of. The best way to guard against this is the current MER with 1% trailer model and not allowing ANY additional fees (other than a small self direct fee) if someone purchases a mutual fund. This should be another regulation and will be the easiest way to seek out and remove the unethical advisers while putting client interests in line with ethical adviser interests. By the way, if MERs are generally in a 2% to 3% range, it is not from collusion or a lack of competition. There are many many mutual fund companies with thousands of funds. With low cost alternatives readily available, this is where fair competition puts MERs.

One extra thing to note about MERs. I have noticed that mutual funds, particularly at the banks, are generally at very similar levels to some funds I choose, many at around 2.5%. They are NOT paying trailers to anyone for these over the counter funds. Will removing trailers lower Bank MERs? That is doubtful. Perhaps a regulation that trailers can only be paid to advisers is in order. If a client purchases a fund, that I could provide, from a bank's discount brokerage, there isn't any advice given, why should the trailer be paid to the bank?

In conclusion, regarding issue 1 of the CSA consultation paper, this compensation model with the extra regulations I have suggested WILL align the interests of clients, advisers, and fund managers making portfolio performance everyone's primary concern.

Issue 2 of CSA consultation paper - Embedded commissions limit investor awareness, understanding and control of dealer compensation costs.

My clients are fully aware of how MER's work. I tell them if they got 10% in a mutual fund and the fund's MER is 2.5% then the fund manager got 12.5% return on the fund of which 1% goes to my mutual fund dealer and after they take out my overhead, I get the remainder. Also, again, from issue 1, I tell them if I get a DSC and what the DSC schedule is. Again, these get paid to my mutual fund dealer and after my overhead, the remainder comes to me. After the disclosure on the amount paid to my mutual fund dealer, I don't see how you can make investors any MORE aware of dealer compensation. After this knowledge, with the numerous other investment types such as ETFs, robo advisers, fee for service advisers, etc, etc, we have to ask ourselves why do investors stay with an adviser that has embedded commissions? ETFs like Bank of Montreal's S&P/TSX ETF has a 0.05% MER, practically free. ETF mutual funds have been around for over 20 years and ETFs are constantly advertised in the media so is it possible that investors haven't heard of them? The answer is of course no and, in the information age, anyone looking for understanding of compensation models can readily find it. Before I started working for a mutual fund dealer over 20 years ago, Altimara Investments, a mutual fund company, had a S&P index mutual fund with a 0.5% MER, very low. All the Banks have ETF mutual funds with very low MERs that you can buy over the counter so again, why would clients stay with an adviser that has embedded fees? The answer is simple, investors go where they think they will get the most return. In the information age with all the media advertising about alternatives, I refuse to believe they are unaware of the alternatives to embedded commissions and I refuse to believe they do not care enough about their savings to at least look into this issue.

In conclusion, regarding issue 2 of the CSA consultation paper, embedded commissions do NOT limit investor awareness, understanding and control of dealer compensation costs.

Issue 3 of CSA consultation paper - Embedded commissions paid generally do not align with the services provided to investors.

In my practice, I have clients that call me very often to very rarely. I call them all periodically but I obviously cannot force them to call me back. The clients that call me often get very good value for their embedded commissions. The clients that call me rarely have the right to call me as often as they want. They choose not to. So, why don't they leave and go to a compensation model that would benefit them? As stated in issue 2, I refuse to believe they are unaware of the compensation alternatives. In my opinion, they must believe I will get the maximum return for their portfolio and they must be satisfied with their portfolio knowledge or they would call me. Otherwise, why would they stay? Why wouldn't they pick up the phone and call me? Again, I refuse to believe they simply don't care enough about their investments to bother to pick up the phone. Canada is a free country, they CHOOSE not to call me back. If they believe they are getting the most return for their portfolio from me should the CSA force them to go to an alternative compensation model? Does the CSA believe investors lack the intelligence to move on their own and therefore have to force them to change? Again, in the information age, with all the alternatives available, the answer is obviously no.

In conclusion, regarding issue 3 of CSA consultation paper - Embedded commissions paid generally DO align with the services provided to investors.

On page 5 and again toward the end of the consultation paper the CSA stresses "We emphasize that we have not made a decision to discontinue embedded commissions." There are a few reasons why I feel like the decision to ban embedded commissions has already been made and we are simply going through the motions of consultation. On page 6 of the consultation paper, the CSA claim that they consider Canada to be a different market and "the potential impacts from similar reforms in Canada might not be the same." That certainly seems like a stretch. How can you prove that? "Might" not be the same? That sounds like lawyer speak to me. Change the regulation and HOPE for the best? Are statements in the consultation paper, like on page 98, "can lead to under performance" and on page 101 "may negatively affect investors" the type of language to support this argument? Also, I didn't see any references to studies that say, in the U.K., the small investor has been hurt other than on page 141 of the paper where it says there are "Higher advice costs for some". How many is some? Again, very vague. As we all know, there will be studies that agree with this conclusion and studies that disagree with this conclusion. The CSA has chosen to quote studies that support banning embedded commissions. Has the decision already been made? If so, this displays a liberal elite, nanny state attitude at the CSA. This is the way I view FAIR Canada. They seem to think they are protecting people who can't protect themselves. Again, as I have said previously, it assumes investors do not have the intelligence to make their own decisions so the nanny state must regulate on their behalf. As an investor, I find this assumption insulting. As previously stated, with alternative compensation models readily available during the information age, it simply doesn't stand.

One more note: I talked to another adviser that said if his wealthier clients want cuts to their fees he will increase fees to his less wealthy clients. He refuses to take a pay cut. This seems like one unintended consequence of banning embedded compensation. The small investor will end up paying more and if they can't afford it, they will be on their own. Wealthy people will always pay fees, lots of them, and there will always be unethical advisers that figure out how to work around the rules no matter which compensation structure you choose. Further to that, in the consultation paper, page 120, it says "Fee-based option not a true choice for everyone". As an adviser, if the ban does come into effect, I will be forced to stop working in this industry because I will not believe the CSA cares about the small investor or small adviser and are only interested in regulation for the sake of regulation. You will have lost one of the good guys. The CSA is supposed to make decisions on behalf of all its stakeholders, including investors and advisers. If not, then who are they working for? Bans lead to unintended consequences. Proper regulation of all the current forms of compensation is the correct way forward.

Thank you for your consideration.

Sincerely,
Dan.

The Moral Case
(and thus practical case)
For Embedded Compensation In Mutual Funds

One individual's response to CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions

David McGruer
Ottawa
June 2017

The contents and opinions expressed in this submission are my own. In no way should they be construed to be those of any individuals, businesses, associations or organizations I am affiliated with. Any inconsistencies or errors are mine and mine alone. I'm just a guy writing this without compensation and without the hundreds of millions of annual budgets spent by regulators. I write in the faint but still real hope that one day such arguments will no longer be needed because a society based on reason will have developed.

Along the way the reader will find several short comments that are in bold face with a line above and below. These are not excerpts from the text but rather are side commentary on the subject being discussed, designed to prompt further thought outside the main line of thinking. I hope they are not too distracting and that readers find them interesting and valuable. I have bold faced some other portions that I believe will help readers identify key statements and refer back to them more readily.

TABLE OF CONTENTS

Introduction

After reading CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions I felt dismayed at the great harm that would be inflicted upon Canadians if this initiative was implemented and disappointed that securities regulators, who are charged above all with *protecting* Canadian investors, would be the ones *infringing their rights*, in direct opposition to the fundamental mandate given to them by the elected representatives of the people.

I expect the CSA will receive other professional-quality submissions (Advocis, IFIC, fund companies, etc.) that address the numerous questions posed in the Consultation in great detail and demonstrate how factual technical, economic and practical information contradicts the default position the CSA has taken in proposing a ban on embedded compensation. With their far greater resources, I cannot duplicate the quality of their work and instead have chosen to focus on the most important area of discussion - the area avoided at all costs by the CSA and unfortunately by almost all submission writers - the subject of morality.

I intend to demonstrate the morality of embedded compensation in mutual funds by critiquing the CSA Consultation Paper from five critical perspectives.

1. I will examine the CSA's assumptions about what is the proper standard of the good. On this it is very important to be very clear and explicit.
2. I will consider whether the CSA places ethical issues in their full context in order to gain a full understanding of the meaning and impacts of a ban on embedded commissions. I will carefully look at a few of the the clear positives and supposed negatives of embedded commissions.
3. I will discuss how information provided by experts should be used properly. I will examine both content and method of research reports that have been used to justify the CSA position on embedded compensation.
4. I will examine a few of the fallacies used to make the case the CSA seems determined to support.
5. I will summarize the big picture.

1 - What is our standard of the good?

Is the very popular use of embedded compensation in mutual funds and other investment products a fundamentally moral choice or an immoral choice? To answer this question, we need to be clear on our standard of value—our metric of good and bad—in investment regulatory issues. I find that the CSA position that embedded compensation in mutual funds should be banned is fundamentally a moral argument and one that is wholly incorrect. This response will demonstrate why this is so and provide a fully moral alternative position the CSA should take on this question and all similar ones.

The CSA paper refers to embedded compensation as "a compensation model with inherent conflicts of interest", with the emphasis on conflict of interest clearly indicating the CSA sees this as a moral/ethical problem. The online legal dictionary defines a conflict of interest as "*the situation in which a public official or fiduciary who, contrary to the obligation and absolute duty to act for the benefit of the public or a designated individual, exploits the relationship for personal benefit, typically pecuniary.*" http://legal-dictionary.thefreedictionary.com

The key terms used in this definition are "*act for the benefit of*" and "*exploits..for personal benefit*." I believe it is safe to assume that a financial advisor's highest purpose is to act for the benefit of the client. As the CIRANO study ("*advised savers received net median returns that were about 3% points higher than non-advised participants*") and others demonstrate, advised clients are currently far, far better off in the long run than non-advised clients, so it is clear advisors are already broadly acting for the benefit of clients and the benefit is large and robust. The question prompted by the CSA paper then might be whether the advisor is acting in the interest of the client while exploiting the relationship at the same time? For "exploit" to be applicable, we need to look at what this term means, and Wikipedia says it is "*to take advantage of something (a person, situation, etc.) for one's own end, especially unethically or unjustifiably*." The word exploit would thus not apply to situations where there is an economic exchange of value for mutual benefit where the terms of the exchange are clear to both participants. Such exchanges are by definition just, not unjust, and win-win. Under a political system that properly protects individual rights (the moral meaning of justice) almost all economic activity is of this type since fraud is illegal and is prosecuted and punished.

An advisor's value proposition

Now let's examine the moral position of a financial advisor who offers the following value proposition to prospective clients.

- The advisor's functions are (a) setting and quantifying a goal, creating a plan, which, at historical returns, would realize the goal, and funding the plan with an appropriate portfolio (about twenty percent of his value proposition); and (b), behavioural coaching at times of pronounced emotional stress, when the client is at greatest risk of making The Big Mistake of turning a temporary decline into an investment loss by selling investments during a decline (about eighty percent of his value proposition).

- The advisor does not charge for selection and timing because he cannot deliver these consistently - no one can - and because relative investment performance is totally irrelevant to long term, real life financial outcomes. Above all, *"outperformance" is not a financial goal*.

- The **advisor's fee is approximately one percent per year of assets under administration**. This covers the costs of the services provided to the advisor by the investment dealer, the costs of running the physical office location and - most importantly - the personal advice you receive from the advisor. This fee may be embedded in investment products like mutual funds or charged separately to the client's account, but the advisor finds the embedded option far more economical and believes it also fosters better client behaviours.

In this example the advisor is making a clear value proposal to the client and stating a clear amount of compensation, with alternative mechanisms for that compensation, one of which is embedded and the other billed to the client account. Note in this case that the management fee of a mutual fund the advisor uses is public and always has been, is disclosed through multiple clear sources, the client knows exactly how he pays the advisor and has agreed to it regardless of the mechanism chosen. The advisor may well wish to use the embedded mechanism for its vastly superior economy and lower cost to the client, ease of use, resulting cleaner client statements, client behavioural benefits and other reasons - see more on this below. The client may disagree with either the amount or method of compensation and thus no exchange takes place and the client seeks another advisor to agree with his terms. Unless both client and advisor agree, no transaction takes place and both the client and the advisor's right to choose has been respected. As I said, this is the very definition of a win-win free market transaction.

Government-run schools have done a remarkably successful job of graduating financial illiterates who are uniquely un-prepared for the real world. What percentage of high school grads who get their first job are required to complete an income tax return without the the least clue about the nature, structure and reasoning behind the income tax system? Do they know anything about mortgages and debt, life and disability insurance, economics, finance, education funding, budgeting, investments, retirement planning, powers of attorney and estate planning? Into this breach steps the financial advisor, charged with overcoming the abject failure of the educational system to prepare students for real-world financial issues.

Now back to morality. Under a political system that protects the rights of its citizens, the economic exchange illustrated above is perfectly moral because it is voluntary - it is freely chosen by both parties involved. Now imagine a third party comes along, sees this arrangement, then states that the arrangement may produce sub-optimal results, there may be a conflict of interest and such an exchange of values should be banned by law. Whose opinion will determine what is optimal and whether there may be a conflict of interests? The two people actually involved in the agreement or someone who is unknown to those people and they will never even meet? Who will decide to forbid the two parties from coming to an agreement and by what means will the ban be enforced? What threats will be used to discourage such trades, what police force will take action against those who might agree with each other and trade anyways and what punishments will be forced upon those who dare to make such an agreement?

This is all to highlight the title of this section - the standard of the good when it comes to a compensation mechanism. Is the moral standard a) whatever a third party such as an agency of the government arbitrarily says it is; or b) what freely acting parties agree is a mutually beneficial transaction? I believe **the proper moral standard is the one that leads to maximum human flourishing, meaning it allows for the maximum use of individual reason, decision-making and choice in economic activity**. This does not mean that every choice will be optimal according to someone's scale, it means that it allows for maximum options to be available and the most opportunity for people to think and choose in the absence of coercion.

The vague, morally-charged statements like "embedded compensation is an outdated model" or "Canadian mutual fund fees are the highest in the world" are an attempt to put something over on you. Check their premises.

Free to choose

A system that uses force to limit or even impose a total ban on free choice to trade is by definition immoral, unethical and should be condemned by all members of a civilized society. Presently, about 85% of mutual fund assets are in funds using the embedded compensation model, making this **the most popular form of advisor compensation ever devised**, by far and the only form of compensation that provides affordable, accessible financial advice to middle and low income Canadians on a large scale. So why do those who pretend to speak for these Canadians hold a position so completely opposite to the self-evident preference of those same Canadians? Further, in The Gamma Factor and the Value of Financial Advice by Claude Montmarquette and Nathalie Viennot-Briot the researchers found that more than 85% of households with a financial advisor chose their advisor and were not approached by one. Here I must again emphasize the crucial element of individual consumer choice - from among the wide range of compensation models available on the market, the vast majority of consumers have chosen advisors using embedded compensation. Ask yourself - does anyone have the moral right to forbid the free choice of consumers and the advisors who serve them? Does a group of people have this right? A large group? A majority of voting citizens? Their government officials? I don't think so.

The 5% per year embedded service fee!

Advancing a proposition to its extreme logical conclusion is often helpful in illustrating its correctness. Let's take the example of embedded compensation to an extreme: imagine a mutual fund company set up funds that allowed the advisor to select any amount of service fee the advisor desired, and an advisor set up a business and offered his services onto the market for 5% of assets under management per year - a 5% embedded service fee!. The advisor will certainly have to try to make a case to prospective clients that his advice is worth the 5% but since a free market is a competitive one, it is highly likely all clients would choose from one of the many advisors willing to work for less than 5% per year - heck, the client can find an online discount brokerage to buy EFTs that have almost zero compensation in their structure. It is only by allowing for all such business models to be offered on the marketplace that clients can sift through the options and choose the model that meets their preference. Notice that there are zero, and never have been, any mutual fund companies that allow such an option within their funds. Why? Because the fund companies rationally understand that competitive pressures make this a non-viable choice in the eyes of consumers and that the value of their reputation would be severely harmed, if not destroyed if they did so. Thus, creating such a model would be irrational and non-economic. Preferred models come to dominate the market and other advisors see this and adapt accordingly. **This is exactly how markets work and how the price signal works to make markets the most moral and most efficient mechanism for value creation possible: competition to find clients who agree with the advisor drive pricing to optimal levels**. By optimal I don't mean zero or

5% or any specific number, I mean the levels chosen and ever-changing by freely acting people in their roles and consumers and producers of advice.

The fully moral system of financial advice

So what is the full moral system I promised to disclose at the start of this section? It is one where people who make it their business to assess investment and business practice standards evaluate investment products and financial advisors and stake their reputation, and thus business success, on the accuracy of their judgement. It is also one where the government vigorously prosecutes and punishes fraud in its various forms. For example, if a professional association grants a designation to an advisor and the advisor is found to be not living up to the standard, then the designation may be revoked and the advisor's reputation and business impaired. Such an association may have insurance that compensates clients in case of the illegal or incompetent work of a member advisor. An advisor may have insurance that protects clients in case of certain negative occurrences. Government has an objective and robust court system that investigates claims of fraud so clients know the legal system backs them and is reliable. This system would have presently unknown but no doubt numerous options provided to consumers. Above all, buyers of advice would be fully free to choose among the variety of business models offered by freely acting advisors and fund companies would be free to design whatever products are chosen by consumers and their advisors. **Everyone's rights would be protected and none would be violated, especially by agencies of the state that are charged with protecting them**.

2 - What is the full and proper context?

The option for embedded compensation is of tremendous value in increasing both the supply and demand for financial advice and thus for the creation of life-enhancing wealth in our society. The possibility of a minor potential conflict of interest is a small side effect in the production of this great good. The CSA paper only lightly acknowledges the great social value of financial advice but places great emphasis on the small potential side effect. This is like proposing to ban vaccines because studies prove there are some side effects that are in truth very minor for the vast majority of people while ignoring the fantastic value in enhancing the flourishing of human life.

First, consider the fact that comprehensive, well designed, carefully reported and groundbreaking studies such as The Gamma Factor and the Value of Financial Advice by Claude Montmarquette and Nathalie Viennot-Briot are given only brief attention in the CSA discussion paper. This study, as illustrated in Figure 1 on the next page, shows that:

> In 2014, the impact of having a financial advisor took effect as soon as four years: for comparable households, the one with a financial advisor gains 69% more value for its investment assets. The additional value reaches 290% for a household with an advisor for 15 years or more (3.9 times the value of assets of the equivalent non-advised household).

INCLUDES COMMENT LETTERS

This is an enormous creation of value! *After* the fees paid to advisors and for whatever products were used, the long-term advised client has about *quadruple* the financial assets! Imagine the wealth of a country where everyone had a financial advisor - the wealth of the society, the advances in science, medicine, the arts, technology and culture that would be possible. It would be like advancing the progress of the society by decades, with benefits for all the members of society, especially those least able to care for themselves.

What is the equivalent gain in the rate of return for advised investors?

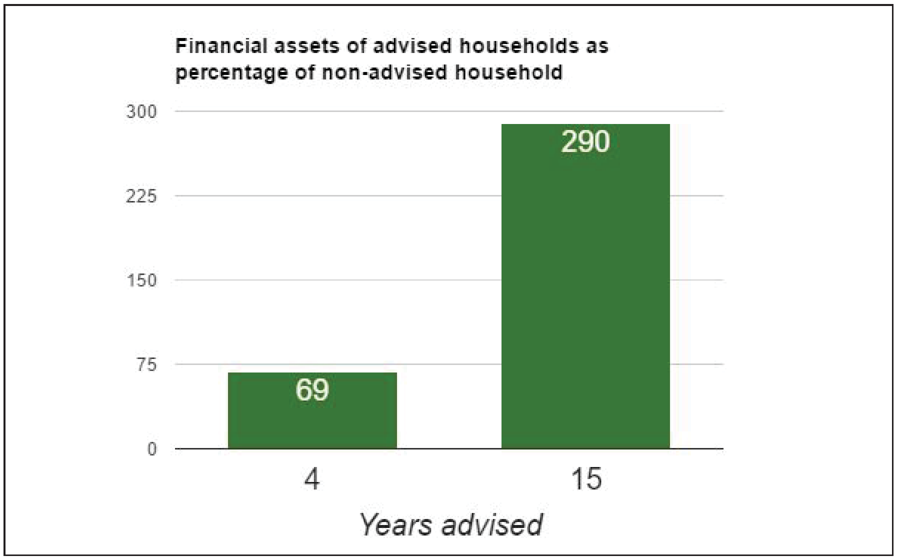
Although the authors of the study refer to other research showing an equivalent of 3% or more and do not show us a similar calculation based on their own data, it is possible to do this using the formula for the future value of money. Montmarquette & Viennot-Briot identified that after 15 years the advised households have accumulated 3.9 times the financial assets compared to non-advised households. Table 1 below shows how I have done this calculation and it finds the rate of return equivalent for advice to be 9.5%.

Table 1. Long term value of advice calculation		
Present Value	PV	100
Future Value	FV	390
Number of time periods	n	15
Rate of return	i	9.5%
FV=PV(1+i)^n		
i=((FV/PV)^1/n) -1		

Anyone who says "mutual fund service fees reduce client returns" is also saying "financial advice is a pure negative value for clients."

While one can argue the significance and method of doing such a calculation, I use it simply as one way of demonstrating that the value of financial advice is large- and again, note that this is calculated <u>after</u> all mutual fund fees and advisory fees have been deducted, so it is a net gain to the client. **I have long believed that my clients' gains from my advice are multiples of what they pay me and that I could never charge them anywhere near as much as the value I create**, and this study confirms my belief with careful measurements.

Figure 1. The financial assets of advised households versus non-advised households.



Source: The Gamma Factor and the Value of Financial Advice by Claude Montmarquette and Nathalie Viennot-Briot, 2016

The true public good

You see, just as energy is the industry that powers all other industries and civilization, finance is the sector that manages the allocation of capital to the best people and the best ideas that provide the very foundation of modern human life. Just as energy is the equivalent of calories in the human body and the power grid is like the blood vessels in our bodies, finance is the equivalent of the neural network that controls circulation. Good financial management makes all other human values more possible or even enables their creation in the first place. **The provision of good financial advice is of immeasurable value to society**. How do you measure the difference between a society that has vaccines and laser surgery and one that does not, one that has electronic communications and one that does not, one that has powerful machines to do work for us and one that does not. All of these and everything else is facilitated by finance - it is the communications and directions that connect the impossibly complex network of supply and demand for everything we produce and consume.

The fact is that financial advisors don't take inexpensive products and make them expensive, they take financially uneducated and emotion-driven prospective clients and turn them into better stewards of wealth who are better protected from financial disasters.

Consider the potential damage to society if the rights of citizens are violated by banning the embedded compensation option for financial products. Never mind the fact that the ban is immoral as shown above, what about the economic damage and the wealth destroyed or never created because the supply of financial advice was reduced and/or the demand for such advice was reduced. In fact, because multiple options are available for compensating advisors right now, we know that banning one type of compensation can only lead to a **decrease in demand for advice**, since it is impossible that every single consumer who preferred embedded compensation before will switch over to un-bundled compensation. And what of the supply of advice? For many reasons, under a system of reduced choice there will be fewer advisors who will target a smaller number of wealthier clients, so the **supply of advice will decline**. What of the price of advice? When the most popular and economical form of compensation is banned, do you think the price of advice will go up or down? Right… **the price of advice** will go up..

Why don't regulators leap for joy to learn that advised investors have long term financial security that is hundreds of percent higher than those without advice and then do everything in their power to see that as many advisors as possible enter the business and as many investors as possible understand the tremendous value of advice? Maybe it's that doing so would mean their present budgets of hundreds of millions of dollars per year are poorly spent.

36,000 extra annual transactions per advisor

While there are similar concrete examples that can be used for several other harmful effects a ban on embedded compensation would have, I will leave that to others (and I refer the reader to the the excellent paper "A major setback for retirement savings: changing how financial advisers are compensated could hurt less-than-wealthy investors most" by Pierre Lortie, 2016) and use only one to illustrate the point clearly. Imagine, if you can, that you are a financial advisor with two hundred households in your practice (not at all unusual) and they have 1,000 accounts in total. For an account where there is a direct advisory fee charged to the account, there is a transaction for this fee shown on the client statement, thus in your practice there would be 1,000 additional transactions per month or 12,000 transaction per year. As they say in the infomercials… but wait! There's more! There is another line on the statements to show the HST on the fee! Thus, your practice now has 24,000 additional transactions per year. But hold on, wait for it… there's still more! How is the fee to be paid? There must be cash in the account to pay for it, so there could be another transaction to sell a tiny portion of an investment to pay for the fee and tax - that's up to 36,000 transactions per year!! Starting to get the picture?

The actual financial advice reality: abundant, affordable, accessible advice with embedded compensation enables both client and advisor to focus more time on improving lives instead of administering payments and taxes.

Oh, and the average household would then have up to 5 x 12 x 3 = 180 transactions per year on their statements just to administer the payment for advice and the associated HST. Do you think this might cloud their ability to interpret the much smaller number of transactions that were actually recommended by their advisor? Do you think the client might perceive that with such a high number of fee and tax transactions there should be consequently more investment transactions, even though once an asset mix and a portfolio are in place, research (see the work of Barber and Odean among others) clearly indicates that nothing is virtually always the *right* thing to do? But nothing is also the absolutely *hardest* thing to do and without a caring, empathetic and tough-loving advisor to keep clients from doing something, the plan is highly likely to be blown up. Do you think an extra 36,000 transactions on statements will occur and that the cost of these transaction is nil? **Will costs to the advisor, the dealer and the client go up or down with 36,000 more transactions per year?**

Now how does this compare to the embedded compensation via a mutual fund service fee? In this case the mutual fund company calculates the total assets per advisor at the fund company and sends one payment to the dealer per month, or twelve per year. Let's see… 12 vs 36,000, which is more economical, easier to administer, less expensive for the client, leaves statements looking cleaner as they show transactions related to recommendations instead of administration, easily enables clients to see bottom line results after the fund company, dealer and advisor have all been paid? Could it be that the compensation model requiring 12,000 times more transactions to administer is a bit less rational in most cases?

Embedded mutual fund service fees may cause a fund to underperform a similar one that has no such fees, res ipsa loquitur, but we know for certain the clients who pay those fees are far, far better off for having the advice paid for by those fees.

But never mind rationality, practicality and economics **- what about the specific morality of embedded service fees?** The CSA claims their existence creates an intractable, irreducible conflict of interest. Is this true? Do studies really show this? Can they? The last section will examine this more closely.

3 - How should expert information be used?

While the CSA paper makes reference to a number of academic studies, two of them are given special prominence and appear to have been assigned much higher meaning than the rest: the studies known in the industry as the Cumming Report and the Brondesbury Report, which were in fact commissioned and whose parameters were specified and limited by the CSA. I will examine these in their proper context to illustrate the proper role of expert academic research in the process of formulating public policy. Before doing so, it must be stressed that the CSA specifically **prohibited the authors of both studies from considering the value of advice in their report**, thus zooming in on the potential consequences of small potential side-effect factors while deliberately avoiding any focus on the consideration of the greatest factor of all in the determinants of client success: the presence of advice.

Instead of comparing the current embedded fee environment to the one where consumer choices are eliminated and costs are higher, anti-fee proponents compare it to a non-existent fee-free utopia where clients act the same with or without caring advice.

The Brondesbury Report

The Brondesbury Report conducted no new research and was only a literature review of one area of research. The authors provided clearly conflicting conclusions. On one hand they say "evidence on the impact of compensation **is** conclusive enough to justify the development of new compensation policies" while on the other hand they state:

- While removing commission lowers product cost, advisory fees may rise as a means of paying for the cost of service. There may also be new or increased administrative fees, higher costs on margin accounts and lower payments on cash balances.
- There is **no** conclusive evidence that investors will have greater after-fee investment returns with asset-based compensation instead of commission.

I find that when I read the Brondesbury report there is an attempt to insert an unwarranted conclusion that compensation policies should be changed, despite much stronger statements that any such change is likely to cause both expected and yet unknown harms. It is as if the authors wrestled with the visible evidence that advice is of tremendous value, that freedom of choice is important, that a ban on one type of compensation might well cause great harm, yet inserted a conclusion they thought was what the CSA wanted to hear and was paying for. In the CSA Consultation I find insufficient attention is paid to the harms stated in Brondesbury and undue strength is attributed to the apparent mandate to interfere with existing free market mechanisms.

The Cumming Report

The Cumming Report was different than Brondesbury in that its task was to conduct original research using a large database of Canadian mutual fund transactions over 2003-2014. Specifically, it was to "examine the relationship between risk-adjusted performance ("alpha") and future fund flows ("flow-performance slope"), and fund flows that are obtained regardless of past alpha ("flow-performance intercept"), and consider whether or not flow-performance intercept and slope are influenced by the fund fee structure."

To highlight my key criticism of how the some research such as the Cumming Report is being wrongly interpreted and misused, consider its oft-referenced conclusion: "Trailer fees increase new flows regardless of past performance. Generally, the greater the trailer fee, the greater the level of net flows that has no relationship to past performance. For example, a 1.5% trailer fee increases the average monthly flows by 0.3% of AUM each month regardless of past performance." Okay, so on the face of it this seems conclusive and seems to cry out for a ban on service fees, but is this a fair interpretation of the data and is the full context examined? Not at all. Even if the interpretation was correct it does not justify a ban on embedded compensation, as I will show later.

Consider just two aspects of the brief quote provided. First, it states that monthly flows are 0.3% of AUM higher in a fund that pays a 1.5% service fee. Okay, but **how significant is this**? We are talking about 3.6% per year of increased flow, so it would take twenty years for the fund to double its size when compared to if it paid an average service fee instead of an elevated one. Twenty years - during which much would change in the fund, the fund company, the advisor, the dealer and the marketplace. It is extremely unlikely the elevated service fee would persist very long because market competition would be very likely to deal with it with no regulatory intervention.

Where are the high-service fee funds?

How can I justify this last statement? That leads me to the second aspect - the 1.5% service fee that is given as the example. Where are these funds that pay a service fee of 1.5% vs the industry standard 1% for equity funds? How big are these higher-fee funds and what percentage of the industry assets do they represent? I understand the number of funds paying a service fee over 1% is 10% of the number of funds in Canada, but obviously many or most of these pay less than 1.5% plus they are likely not large funds in terms of assets, so funds that pay 1.5% likely represent much less than 10% of industry assets. It is speculation on my part, but **I'd bet that less than 1% of fund industry assets pay 1.5% or more in service fees**. I have been an advisor since 1993 and I am not aware of nor have I used any large funds that pay over 1%, but I have seen a few small funds that paid 1.25%. If I saw a fund with otherwise highly desirable characteristics and did pay 1.5% I would recommend to the fund company to reduce the service fee to be in line with the competition if they hope to attract my business, because I don't want to be associated with a high compensation fund in order to protect the value of my reputation.

Connecting this with the finding from Cummings, and **we have a very small fraction of funds paying above average service fees and attracting a slightly higher inflow of assets**. In 2014 Investor Economics reported that "over the last three years, two out of the three years higher trail products have actually been in net outflows and last year for 2013 they were in net inflows, but as it turns out the funds that had the higher trails that did see the inflows also happened to be the better performing products." I conclude that overall, the issue of high service fee funds is a statistically small one and is certainly no justification for a nation-wide violation of rights likely to cause large scale and lasting financial damage to the country.

A more comprehensive study of the determinants of fund flows

Another Canadian study released in 2015 "Analysis of Factors Influencing Sales, Retention and Redemptions of Mutual Fund Units" conducted by Investor Economics examined mutual fund flows in their full context, not eliminating all other factors and focusing on one, but instead looking at all potential factors and isolating the most important ones. The study states:

> Our analysis has revealed that no single factor can satisfactorily explain the volume of mutual fund sales and redemptions into a specific fund at a given point of time. Rather, mutual fund flow activity reflects the interplay of a large number of factors. While no factor in isolation offers sufficient predictive value in terms of individual fund flows, three factors have been identified as significantly relevant to advancing the understanding of the volumes and the directionality of mutual fund sales and redemptions.

1. Macro-economic and demographic factors comprise a powerful backdrop to fund flow activity and can overpower all other factors.
2. Individual fund investment return characteristics, expressed both in absolute and relative terms, represent the single most valuable predictor of sales and redemptions at the individual fund level.
3. Preferred access to distribution, either via direct affiliation or strategic alliance.

The researchers went on to examine the influence of advisor compensation on fund flows and found "**The statistical relationship between trailer levels and net flow volumes is not significant**." Further, they "The importance advisors and clients assign to the funds' investment returns, however, supersedes the importance of the level of compensation in the sales process." Acknowledging the shifting preferences of consumers and advisors over time, they go on to conclude "Meanwhile, the shift to unbundled fee-based practice models and the diminishing reliance on the upfront sales commission payouts associated with deferred sales charge load sales in the intermediated advice channels, have continued to lessen the impact of embedded advisor compensation on fund flow activity."

It is the contrast between the Cumming Report and this last report by Investor Economics that is at the heart of my point about the proper use of expert research information. In order to properly use the results of academic research, one must be able to identify the knowledge foundations of the study (that is to say we must examine its underlying assumptions), its research methodology, the statistical analyses performed, the representation and significance of these statistics and the limits to the conclusions one may draw from them before even beginning to use them to form public policy. The CSA commissioned the Cumming Report and asked for a highly specific and delimited result, which they received. However, when a statistically significant result can be found it is not scientifically nor morally sufficient to proceed as if this is equivalent to an assessment of the magnitude and importance of the result.

I drank radioactive Fukushima orange juice

As one extreme illustration of this principle, the reader may recall the earthquake, tsunami and subsequent Fukushima nuclear reactor breach in 2011. Because radiation leaked into the Pacific Ocean, it was spread by currents across to the west coast of North and South America. Thus it is possible that the orange juice I drank at breakfast today that contains California oranges contains one or more radioactive atoms from Fukushima. With sensitive modern instruments we might measure this and declare outrage, however we would be ignoring the significance and magnitude of the measured fact. The full context would include considerations such as a) humans have evolved in a low radiation environment and appear to flourish in such an environment; and b) organic Canadian maple syrup may be more radioactive than the California orange juice that had us outraged.

Expert research information may provide us with factual measurements, but the value we assign to the facts is moral in nature and must be placed in the full context of human life and with the understanding that our goal is to maximize human flourishing.

4. More to think about

To fully understand the errors in thinking within the CSA discussion paper would take much more space, but I don't want to end without examining a few of the fallacious thinking methods employed in the paper.

The abuse-use fallacy

The first fallacy could be called the abuse-use fallacy and refers to the incorrect linking of something that exists that *could* be abused or *could* create a severe conflict of interest such as embedded compensation, and then drawing the conclusion that therefore it ought to be banned under threat of legal punishments such as seizure, fines, loss of livelihood or even prison. Seizure and prison (violence against the individual) is always the threat behind the surface threats, otherwise when an individual refuses to comply, the lawmaker has no power. Even if we were to stipulate that in some cases some advisors choose to recommend products merely because of higher embedded compensation, it is irrational to say that because something can be abused that it ought not to be used at all. The use-abuse fallacy can be used to attack anything you don't like: you can say that because some people drink too much that all alcohol should be banned or that because some people die in car accidents that cars should be banned. Individual cases of abuse do not prove something should be banned, it proves it should not be abused.

We live in a country where the government agencies are focused on making financial advice expensive and inaccessible to a large portion of the population.

The false-attribution fallacy

The second fallacy worth examining is the false-attribution fallacy, which usually follows a simple three part formula. First a story is told where an investor has lodged a complaint based on a claim such as he didn't get his money's worth from an investment that had embedded compensation, or he didn't know about the embedded compensation. The most dramatic case is one where the investor lost money on the investment while the advisor was being paid a service fee even as the investment declined in value. The horror! The blame is then laid on the existence of embedded compensation without exploring other alternative explanations such as the responsibility of the consumer to make rational and reasonable inquiries about the investment, the fact that just about any mutual fund will recover from every decline and go on to new highs if allowed time, or the possibility that the investor acted emotionally and sold the investment at a bad time despite the advisor's best recommendation. The truth is that every form of compensation can be abused yet this is no justification for a legal ban on all of them.

The no-threshold fallacy

Finally, consider the no-threshold fallacy which uses the fact that because a large amount of something can be a problem that any amount of the thing is bad, thus it ought to be banned under threat of legal force. Refer back to my example of the radiation from Fukushima as one example. Think about what regulators would have to complain about if embedded compensation was 25% lower than the average of today - would this be low enough for the CSA to conclude that it was not dangerous, unethical and thus ought to be banned? What if it was 50% lower? 75% lower? You can see that there is no objective threshold at which it can be morally justified to ban embedded compensation since there is an infinitely fine spectrum of possible compensation levels. All that could be done to establish a cutoff point is to make an arbitrary decision based on whim and emotion, not reasoning and based on correct morality.

The false-attribution fallacy and the no-threshold fallacy for a particularly dangerous combination in the hands of regulators. Because there will always be stories of investors who lost money on investments that had embedded compensation, regulators use these as evidence to support a complete ban on all investment products that have embedded compensation. All too often, there is a failure of regulators or politicians to use human flourishing and the social conditions required for it as the standard of the good.

The liberated human mind, not the behaviour coercing bureaucrat, is the root of progress.

---

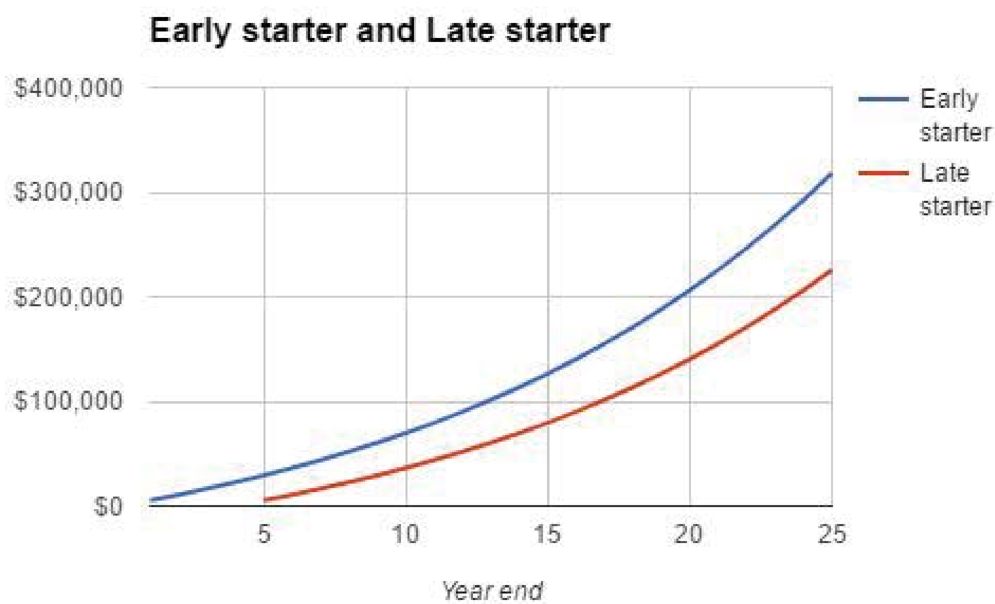
5 - The Big Picture

I hope the reader can now see that the CSA proposal to ban embedded compensation in mutual funds and other investment products:

1. fails to properly place compensation in its full context;
2. uses an incorrect standard of value, preventing the possibility of a conflict of interest, instead of that proper for a society dedicated to human flourishing;
3. makes incorrect use of expert research data that even deliberately avoids considering a full analysis and minimizes contradictory evidence;
4. uses several logical fallacies to make the case for a ban on embedded compensation seem strong or even irresistible when in fact there is no moral or practical justification at all for such a massive violation of the rights of investors, advisors, investment dealers and mutual fund companies.

That which is not seen

The harm that could be inflicted on Canadians by a ban on embedded compensation would be widespread and severe, reducing the future wealth of the country and holding back all forms of progress. If a ban is implemented, Canadians will never be able to measure the wealth that was never created, the financial security that was impaired, the higher taxes required to sustain social programs, the health, education, and cultural benefits that never accrued. Just as investment returns compound on an exponential curve (see Figure 2 below) and the person who starts earlier shifts the curve upwards, so do regulatory actions that inhibit investors and advisors from making arrangements that are freely chosen and mutually beneficial create a society with lower demand for advice and a lower supply of advice, retarding the wealth curve of the whole society.



The moral high ground

Financial advisors, investment dealers and mutual fund companies should proudly stand up and proclaim their pride in the good they do, the value they create and the consumer relationships they have established. They need to realize that they occupy the moral high ground and state it clearly in their communications. I do not mean to imply that all advisors operate perfect practices - no such thing exists, or that all mutual fund companies and their products are excellent - this is an impossible standard in the most fiercely competitive market in existence. Rather, I assert that given the relatively free market that existed in the past, advisors and mutual fund companies accomplished incredible good and formed millions of voluntary arrangements with investors. Recent years have seen radical increases in regulation, rising compliance costs and the threat of much more of these.

Let it be said far and wide: in a market where government and its agencies protect individual rights, embedded compensation in mutual funds is a profoundly moral, extraordinarily economical and wildly popular form of financial advisor compensation that has led to unbelievably successful advisor-client results as measured by the accumulation of financial assets by advised investors.

The last word

If the advocates of banning embedded compensation in mutual funds had forced this on the industry 30 years ago, they would have prevented the creation of hundreds of billions of dollars of wealth in Canada and permanently damaged the lives of millions and millions of Canadians, yet we would have never known of this loss because the gains were never given a chance to accrue.

Hello. I am writing on behalf of myself and my husband to voice our concerns regarding the option of discontinuing embedded commissions for financial advisors. As self employed artists, we have come to terms with knowing that we will have less disposable income than if we had chosen to work in other fields. We are happy to sacrifice some of life's luxuries to be able to do the work we love and feel called to do. A big part of or success in being able to live debt-free on our relatively small incomes is due to the advice and guidance we have received from our Financial Advisors. We have been learning a great deal about financial responsibility and planning for our future from our advisors and it is they who have encouraged us to write to you.

Today, Canadians have a choice in how they pay for financial advice, whether through upfront fees or through embedded commissions based on the products they buy and the size of their investments. This is beneficial to lower-income households like mine, because it means that our Financial Advisors can make their living on commissions, particularly from larger clients, while still taking on small clients like us, who they make very little from on commissions, but have a huge passion to help and teach. However, proposed government changes may alter that.

Canadian regulators who oversee the sale of mutual funds are now proposing to ban embedded commissions for financial advisors, meaning that all clients would be forced to pay fees directly. These changes don’t favour those who need professional advice most: Financially vulnerable Canadians who have less money to invest, whether seniors on a fixed-income or young people and artists like my husband and I who are just starting to save for retirement. We would not be able to go to a financial advisor if we were forced to pay direct fees of $100 to $300 per hour. And yet, the proposed changes mean financial advisors will lose the ability to decide how their clients may pay them and will not be able to keep their costs the same. Vulnerable Canadians may lose access to affordable, professional financial advice.

It is not only wealthy Canadians who should have access to financial advisors. All Canadians – regardless of their income or where they live – should have access to trustworthy financial advice.

I believe that Canadians like me should continue to have a choice in how they pay for financial advice – whether through commissions or upfront fees.

These proposed changes mean that:

- I may lose access to affordable financial advice;
- My financial advisor may not be able to keep their costs the same;
- Professional standards in the industry may not be maintained;
- Canadians will have little choice about who helps them manage their finances into the future.

I think the best way to maintain standards and keep fair access to advice is through the professionalization of the industry. Instead of limiting access to financial advisors, professionalization will make the industry stronger and protect the interests of Canadians.

Financial advisors are part of our community, and the advice they provide not only creates wealth, but also makes me feel more secure.

Thank you for taking the time to read this letter and consider our viewpoint on this issue.

Response and Comment to CSA Consultation Paper 81-408 Consultation on the Option of
Discontinuing Embedded Commissions

Class A mutual fund shares have embedded remuneration/commissions called trailers. Regulators have the surprising notion that embedded due to its very nature - is bad. I believe this view to be incorrect.

Associating embedded remuneration automatically with price gouging or skewing is not a correct concept - not even close. As a deposit broker, I get paid a GIC commission and because all the commissions are the same there is no skewing. Extending this concept to the fund industry should not be difficult as I know it works 100% and is proven.

Many believe that "pay direct" by the investor is the one and only solution. They are calling upon the industry to find ways to mitigate the damage (to investors) caused by going to a single-choice "pay direct" model.

I think we should pause here and reflect just a bit. **Regulation should never be designed to hurt investors and asking the industry to find ways to mitigate the damage to investors is just not the right thing to do.**

Rather than ban embedded, regulators should be embracing the concept albeit in a slightly different manner.

My proposal:

FE, DSC and LL mutual fund classes of shares would be eliminated. Let the investor choose whether they want a *negotiated* embedded AUM fee/commission or a *negotiated* un-embedded AUM fee.

Almost all advisors will agree that after almost thirty years, trailer commissions have converged to become AUM fees - specifically for advice and service rather than for distribution. The front-end loads of yesteryear –of up to 9% are now set at 0% as almost all **advisors in Canada have completely eliminated their own front-end load commissions. In effect, advisers have skewed their own commissions to zero.**

According to current statements, the industry is being accused of the pervasive skewing of sales. According to the dictionary definition of pervasive, pervasive means widespread. With close to 30 years experience, I know one thing for sure – skewing is not pervasive –not widespread and I believe –is exceedingly rare.

Embedded remuneration (trailers) is set by the manufacturer of the product –not by the securities firms (excluding proprietary products) or their financial advisers. There have been accusations that sales will tend towards where compensation is the highest. Although this behavior describes the capital economy perfectly, regulators perceive it is a grave problem. Some studies conclude that skewing to higher compensation investment products (impacting sales) is pervasive however these studies did not divulge exactly how much skewing is going on or the degree of skewing. Advisers acknowledge that skewing probably exists somewhere but only as rare outliers.

Cummings is essentially correct – money will flow to where compensation is highest which will be to fee-based accounts that have no caps, are open-ended, not regulated to any degree and remuneration is controlled by the dealer's pay grid.

It is clear that the traditional transactional business for the purchase of securities is dying. Stock trading commissions for the average investor have plummeted over the decades and are just a few dollars per trade or are even free. Average trailers and commissions to advisers have been dropping along with mutual fund MERs. Front-end loads have all but disappeared. Trailers for money market funds have ceased to exist. Competitive pressures to reduce costs are everywhere.

The belief that banning embedded will result in immediate savings does not make sense. At best, separating out the commission from the product should only be a wash. It is similar to arguing whether the HST should be built into the product price or charged separately at the cash register. Either way –the price of the product to the consumer turns out to be exactly the same except I believe it won't be the same. Fee-based compensation could be higher than embedded based compensation for many investors.

The best mechanism to lower costs is through competitive pressures in the marketplace rather than through regulatory mandates.

The regulators appear to have come to the conclusion that anything embedded is bad but regulators have never regulated open-ended fees and appear reluctant to do so. Unfortunately, industry commentators **perceive trailers as evil incarnate and must be stamped out of existence – at all costs and at any cost.**

There is no logic to assume or believe that embedded is the cause of all evil. The regulators made sure that all fees and commissions be made 100% transparent and they have made it happen. Whether a disclosed commission is embedded or not is not relevant in an embedded society where all products and services have embedded costs.

However, what if we do stamp trailers out? And what should replace them?

How might this be done?

Eliminate commissions and trailers entirely. No front-end loads, no DSC fees, no low-loads.

Trailers have an inherent perceived flaw from a regulatory viewpoint. They are set by the fund company and the interactions are between the fund company, the advisor and the firms that the advisors work for. According to the paper, there is a potential for a conflict of interest as a higher trailer might potentially tempt an advisor to steer sales in that direction. How do we deal with the temptation of higher remuneration with a financial institution offering "too high" of a trailer or avoid the temptation to charge "too high" of a fee in a fee-based account?

Rather than let the industry or regulators set commissions and fees, why not **give the investor full control of what they are paying for their investment products and services.**

In the model I am proposing, **trailers cease to exist and would be completely replaced by embedded AUM fees (or commissions)** except there is an important difference. The AUM fee/commission is *negotiated* between the adviser and the investor. In other words, **embedded fixed trailers are replaced by embedded**

negotiable commissions. This would negate the need for an exclusive “pay direct” model.

This will also greatly reduce the large numbers of the “alphabet soup” of multiple classes of mutual funds.

If advisor embedded compensation is negotiated one-on-one with the investor in the same fashion as with fee-based accounts, then there can no longer be any skewing. It is eliminated instantly.

Embedded negotiable AUM fees (to replace trailers) can have a very significant advantage over traditional fee-based accounts. It may be possible that each embedded mutual fund AUM fee can be negotiated individually. **This is a very important and key difference. For example, moving a fixed income mutual fund with a fixed trailer of 0.50% to a fee-based plan will increase investor costs dramatically**. The investor moves from paying a 0.50% annual (trailer) to a lofty 1.0% to 1.5% annual fee (or more) in a fee-based account. **Fee-based plans charge a fee on all holdings in the account**. **All fee-based plans have an inherent conflict of interest to potentially tempt advisers to replace low commissions (fixed trailers) with much higher fees.**

In my proposed embedded negotiable AUM account, ***the investor will have the ability to negotiate the AUM fee/commission on each holding.***

“Pay direct” fee-based accounts would continue to exist as they always have and fees remain negotiable as they always been. Fee -based accounts can also incorporate other negotiable fee structures other than just negotiable AUM fees – flat fee retainers or retainer fees based on tiered AUM, for instance. Or as an alternative, all AUM tiers, minimum account size and AUM fee schedules could be eliminated. The marketplace is proving that it can be extremely competitive without the need to regulate remuneration.

To eliminate “skewing” either make remuneration the same everywhere or make it different for each transaction (make it negotiable).

If embedded commissions are eliminated entirely, there will be mass disruption in the industry as such a regulatory ruling will effectively kill client-held accounts.

There will be massive inflows to set up nominee accounts and investors will be forced to pay expensive annual trustee fees. For small accounts it makes no economic sense to pay a $125 annual trustee fee (plus HST) plus some Dealers charge additional fees for additional registered plans. Full transfer-out fees ($250 + HST) are also notoriously expensive as well.

As a result, **regulators will likely lose future regulatory control over fees. It would be very difficult for any regulator to regulate open-ended fees or to regulate advisor pay grids.** Investor advocates should pay attention that **replacing lower embedded fixed commissions with higher fees may not be the result they really wanted or in the best interest of all investors.** And soon, we will be having conversations about the inherent conflicts of interest that potentially, all fee-based plans have. It is perhaps naive to assume that fee-based "pay direct" plans will eliminate all conflicts of interest. **Fee- based will never eliminate conflicts of interest- they merely create *different* conflicts of interest.**

Moving from client held accounts to nominee fee-based structures could result in increased costs to investors as fees for fee-based accounts could be higher than fixed trailers –especially for small or average investors.

Unfortunately**, investors will pay the price with increased fees and less access to advice** as the industry is forced to go "upscale". When we see terms like "mitigating damage" you can be assured they are referring to small or average investors as collateral damage. **Surely this is not in the best interest of the average investor.**

Based on the paper's comments, I think it is outside the scope and mandate of any regulator to suggest that the industry reduce profit margins or tout specific investments. **Those investment and risk decisions must always be made by the individual investor depending on their personal circumstances. In all cases, the regulatory role should be seen as having a neutral stance –neither favouring one investment product over another or one industry over another.**

Proof of harm

Not much has been written about the *psychology of money* with respect to issuing a new bill or fee to an investor or what an investor actually prefers. The tendency in the investment business is for advisers, advocates, regulators and industry participants are to tell investors what their preferences should be. Perhaps we should be asking investors what *they* prefer.

So how will investors react to being forced to give up their all-in-one embedded pricing and be handed a new bill for service and advice?

I contacted one of the world's best known behavioral economists (**Dan Ariely of "Predictably Irrational" fame**) and asked him ***what the specific impacts on investors would be if investors in Canada were billed separately for their investments*.**

Dr. Ariely explained to me that if a client who has $1 million dollars invested in a savings account, for example, and pays 1% asset under management a year usually doesn't express any concerns***. However, Dr. Ariely argues that if a client had to directly pay $10,000 a year, they probably wouldn't do it. The reason is that people may not seek advice if they have to pay for it directly.***

Therefore, according to Dr. Ariely, ***if Canada bans embedded commissions and starts to bill investors directly, investors may refuse to pay, and if they do they will be upset*. *Investors may not seek advice, may stop investing or may not be put in the correct investments.***

Dr. Ariely's research suggests that forcing investors from embedded pricing to separate billing of fees could have dire consequences.

A single choice fee-based model is not a panacea –not even close. Fee-based plans have been around a long time and have had a relatively long track record. Have they caused advisors to massively pursue the cheapest investments possible? Or convert en-masse from active management to passive ? Advisers transferred their existing Class A shares to Class F and recommended the same investments from the same fund companies. If the embedded model is banned, advisers would be mandated to move the same funds from one account to another - with any additional financial costs borne by the investor. I see financial benefits to advisers but I am not seeing benefits to investors who have to pay more in a fee-based account for the exact same investments. For many investors, they are economically better off in less expensive Class A embedded mutual funds.

Considering financial advisers front-line role with investors, I am greatly disappointed that advisers are largely uninvited to participate in the regulation of their own industry. Advisers are not present in many (if any) regulatory committee role and it seems we have very little input in the regulatory process. That omission, I feel, is a shame.

Conclusion & Recommendations

I would recommend that **both models be retained** with some changes to all-in pricing models. Whether a fee (or commission) is built-in or not, mathematically – it comes out the same but many investors like and prefer all-in pricing. Regulators may **consider making all compensation negotiable**, **embedded or not.**

FE, DSC and LL mutual fund classes of shares could be eliminated along with all trailers. Let the investor choose whether they want a *negotiated embedded* AUM fee/commission or a *negotiated un-embedded* AUM fee.

Financial advisers can bring a lot to the table. Financial advisers should play a greater role in the regulatory process and work towards better regulation of the investment industry.

Respectfully,

Glenn Szlagowski

Re: Canadian Securities Administrators (CSA) Consultation Paper 81-408
Consultation on the Option of Discontinuing Embedded Commissions (Consultation Paper)

Dear Sir or Madam:

Thank you for the opportunity to comment on the CSA Consultation Paper 81-408. I found the document to be a very interesting read that presented a comprehensive and balanced overview of the current state of the industry and some of the challenges we are facing. I thank you for producing this consultation paper and for the opportunity to provide comments.

As an advisor, I felt it important to provide my perspective on actions that should be taken to improve the industry in a manner that will help Canadians achieve a more secure financial future. It is a privilege to work in this industry, and I am very passionate about educating the public and enhancing the experience of every Canadian consumer.

Please note that all comments are only mine and do not in any way reflect those of the dealer I work with or other advisors that I am associated with.

My Story

I would like to begin my comments by telling you my story, and why I believe my perspective is unique. I began my professional career as an Occupational Therapist and worked in that field for 5 years, starting in the late 1990s. Once I'd accumulated some money and paid off my student loans, I became interested in investing and sought out a financial advisor to help me. I found the process to be challenging and frustrating in the sense that the industry was very confusing for me as a consumer. (I believe this issue still exists today some 20 years later.) I then decided to pursue investing on my own and began to read countless books. During this time, I quickly made thousands of dollars in stocks like Nortel, Ballard Power, and some e-commerce companies (that no longer exist). However, I lost it just as fast—probably faster.

But the process of investing intrigued me, and I decided to go back to school to change careers and was fortunate to be accepted to the MBA program at Columbia University in New York. After graduating from Columbia University in 2004, I also completed the CFA designation. For the next few years, I worked on the institutional side of the industry at firms such as BNP Paribas and Alberta Investment Management (AIMCo).

I began working with individual investors in Canada during 2009, because I wanted to share my experience and apply my knowledge to enhance the financial outcomes of Canadian families. I believe I am one of the few financial advisors in Canada who has seen the industry from the lens of both the institutional and retail investing worlds.

To me, being an advisor means truly providing a holistic wealth management experience. It's about making sure that every client has all the rooms of their financial house in order (investing, insurance, retirement planning, estate and legacy planning, etc.). It's about being a behavioural coach to clients to make sure they are saving enough for retirement and sticking to their investment plan, rather than making emotional decisions at inopportune times. It's about making sure that families are adequately insured in the event something catastrophic were to happen. It's about making sure that both members of a couple are adequately informed of their financial situation. It's about speaking to the client's accountant and lawyer to make sure all the client's professionals are on the same page so the client achieves the best outcome. It's about helping clients to understand and mitigate (to the extent possible) their financial risk. It's about helping retirees design tax efficient income streams. It's about helping clients with tax effective estate planning. It's so much more than solely focusing on investing. With respect to the debate between active and passive investing, I would like to add that while fees are important, in my opinion there is room for both passive and active strategies within a properly constructed portfolio.

As was the case 20 years ago, when I first sought out a financial advisor, I believe the industry is very confusing for the average Canadian consumer to navigate. Differences in qualifications, licensing, compensation structures, investment philosophy, services provided, and level of true independence are only some of the issues. I have been so frustrated with this over the years, that I decided to write a book for Canadian consumers. In March 2017, I released *Your Money's Worth - The Essential Guide to Financial Advice for Canadians*. It is my hope that this book will help Canadians navigate our industry and find the advice they need.

Embedded Commissions

In my humble opinion, consumers should have a choice in how they pay fees. Ideally, all consumers would be able to choose whether they pay fees directly or via embedded commissions. In fact, I have had many clients over the years mention that they prefer to pay costs using the embedded commissions model. Consumers should also understand that dealers have costs for the services provided to advisors, and collect a portion of the embedded commissions, or other fees charged to clients.

While I agree with much of your report with respect to the challenges of embedded commissions, I strongly feel that choice is important and that banning embedded commissions is not the silver bullet to solve the industry's challenges. To be clear, a ban on embedded commissions would have very limited impact on my practice as the vast majority of the clients I work with are on a fee-based platform.

One of the central concepts that both regulators and consumers should understand is that the work of financial advisors extends far beyond managing investment portfolios or selecting specific investment products. For me, the role of a financial advisor is about providing holistic financial advice and direction, in addition to making investment recommendations. While fees are important, the value of good advice can often save the client multiples of what they pay in fees (such as via tax efficient retirement planning, in-kind charitable giving, maximizing estate value, etc.). Moreover, the value of advice can be lumpy and should not necessarily be measured solely on investment returns. For example, what is the value of making sure that a young family is adequately insured and has updated estate documents? I very strongly believe in the value of advice, and without their advisors, many Canadian households would not be where they are financially today.

Whenever I see the image of financial advisors being broadly painted in a negative light, I am disappointed. I can tell you that I take my role as an advisor with a heavy sense of responsibility. Indeed, it is a privilege to work in this industry and help Canadians reach their financial goals and objectives. As in any occupation, there are always "bad apples." However, I can tell you that in general, the advisors in Canada that I have come across are hard-working decent people who care about their clients and do their best to help them achieve their goals and objectives. While we have all heard about the many Canadians who have unfortunately had negative experiences with their advisors, the countless stories of extremely positive outcomes (of people who would not have achieved their financial goals and objectives without their advisor) are generally untold - this is unfortunate indeed.

I believe a key issue was very clearly explained on page 122 of the consultation paper - service standards. I quote: “However, there is currently no securities regulation that prescribes, or guidance that articulates, the specific services that an advisor is expected to provide in exchange for ongoing trailing commissions. Under NI 31-103 – Registration Requirements, Exemptions and Ongoing Registrant Obligations (NI 31-103), dealers/representatives are required to provide certain services at the time of the trade (e.g. suitability, know-your-client), but no requirement to provide ongoing advice focused on the client's portfolio." All financial advisors are not created equivalent and there can be an immense variation in the level of service provided by different advisors. To me, this is at the heart of the issue.

Suggestions to Improve the Industry

1. Introduce a **service contract** to the advisor and client relationship whereby every client would receive the following on at least an annual basis - investment review, insurance review, estate planning checklist discussion (to remind the client to ensure basic estate planning documents are completed) and retirement projections.

2. The advisory industry should move to a stronger and common educational standard that is required to become an advisor.

3. Implement new guidelines for use of titles by advisors to ease consumer confusion.

4. Ensure that there are no incentives for advisors to recommend proprietary products. Mandate all firms to have an "open product shelf."

5. Implement a form of "best interest" standard that is commercially viable to administer without causing unintended consequences.

6. Work with insurance regulators to ensure a level "playing field" for all advisors, and eliminate opportunities for "regulatory arbitrage."

7. Consider implementing an active share threshold (for example, 60%) for mutual funds to be classified as active (and charge associated investment management fees). For example, below this active share threshold percentage, fees charged by the investment manager would need to more closely match index funds. I acknowledge that sector concentration of the Canadian market would pose a challenge to fund managers in this regard.

8. Immediately terminate embedded commissions charged in the discount channel where advice is not provided.

9. Consider adding practicing financial advisors to your respective organizations to provide input. Working together, advisors and regulators can improve the industry for the benefit of all Canadians.

10 Work with the provincial and territorial governments to make a financial education course **mandatory** at the high school or post-secondary levels. This course should cover basic concepts including budgeting, investing, insurance, and estate planning. Over the years, I have known of many Canadians who made unfortunate mistakes that were entirely preventable with the right knowledge.

Conclusion

In summary, I believe that banning embedded commissions is not a silver bullet for the challenges faced by the financial advisory industry in Canada. Consumers should have choice in how fees are paid.

Good advice is more important today than ever before because we are living in unprecedented economic times. Advisors can deliver significant value in many areas in addition to investments. The heart of the issue is service delivery standards in these areas. I urge the CSA to strongly consider some of the suggestions made in this letter.

It is a privilege and honour for me to work in this industry, and I (like so many of my colleagues) take it very seriously. I thank you for this opportunity and sincerely hope that my comments will add to the conversation.

I would like to conclude by mentioning that consumers themselves must also take responsibility for their financial future. I will end with words from Glorianne Stromberg. In her 1998 report, Investment Funds in Canada and Consumer Protection: Strategies for the Millennium, Stromberg concluded by stating that the well-being of consumers and investors cannot rest alone on governments and regulators, and that investors “have to do their part. They have to help themselves. They cannot abdicate their responsibility to act prudently and with full knowledge of the facts.”

Sincerely,

Shamez Kassam, MBA, CFA
Author: Your Money’s Worth – The Essential Guide to Financial Advice for Canadians

June 7, 2017

Dear Board of the Canadian Securities Administrators,

I am writing to challenge the CSA Consultation Paper 81-408 *Consultation on the Option of Discontinuing Embedded Commissions* which suggests that embedded commissions incent financial advisors in negative ways.

While I can see that embedded commissions appear to provide a misdirected incentive to people who aren't financial advisors or registered investment advisers, as a financial advisor I know first-hand that they allow me to provide the best service possible to my clients. Embedded commissions allow me to work with young people starting out in life, people who don't have a lot of money, and people who want to trust their financial advisor before they start working with them. The reason these people can afford to work with me is because my fee for working for them is paid out of the trailer on their investments, their mortgage, and a commission on the insurance products they choose to purchase -- not out of their pocket.

Following are some examples of when paying out of pocket holds people back from using a service:

1. Approximately 50% of Canadians don't have a will. http://www.advisor.ca/tax/estate-planning/48-of-canadians-have-no-will-survey-230734
Middle class Canadians (or "every day Canadians") think that having a will done by a lawyer is too expensive (despite it being the cheapest legal procedure they will pay for) and that belief holds them back from approaching lawyers to assist with their wills. Many of them choose holographic wills or will kits instead which could be done incorrectly and assets are distributed according to their wishes. Others don't get wills at all, leaving their families to divide up their assets after death.

2. Canadians with group dental benefits are more likely to go to the dentist than Canadians who have to pay for dental care out-of-pocket. http://www.hc-sc.gc.ca/hl-vs/pubs/oral-bucco/fact-fiche-oral-bucco-stat-eng.php

3. Most Canadians do not pay to get their income taxes done because they don't want to pay out-of-pocket. Those who do pay to have their taxes done either have complex income taxes and/or will be getting a refund.

4. When access to health care in Canada is compared to access to health care in the United States, more middle-class and lower-income Canadians have access than in the United States because they don't have to pay out-of-pocket. Because of this, Canadians have a longer life expectancy than Americans and Canadians with chronic health conditions (such as cystic fibrosis) have a significantly longer life expectancy than Americans with chronic health conditions.

5. Many Canadian women choose to dye their own hair instead of paying a hair stylist for it because of the out of pocket cost.

6. Many Canadians choose to do free exercise (such as running, riding their bike, walking, YouTube exercise videos) instead of joining a gym, exercise classes or hiring a personal trainer because they don't want to pay out of pocket. Even people who do pay to exercise still do some form of free or low cost exercise.

7. People with access to state-run elementary and post-secondary education programs are more likely to go to school than people who pay out of pocket.

Currently, all Canadians have an option to pay an hourly rate out of pocket to their financial advisor or registered investment adviser, yet most people choose not to pay their financial advisor or registered investment adviser that way. Paying an out of pocket fee-for-service can benefit some people such as some high net worth clients, but it doesn’t benefit most people. Canadians who can't afford to pay out of pocket, but still need advice, can afford to pay for the advice they receive through embedded commissions.

Recently I’ve been working with several 15 year olds to 25 year olds who have saved some money -- between $3,000 to $15,000. To them, that's a large sum of money, and all of them worked hard for it. All of them want to do the right thing with it, but they aren't sure what that is. With each of them, I spent 1.5 - 3 hours discussing how investing works before they decided to invest their money. I did it because I know that if I spend time with them when they are young, they will start proper saving and investing habits early and I will have a client for life. If they take my advice at their age, they will become wealthy and I will get paid for years to come.

If each of those young people had to pay me per hour to listen to me talk about investing, how much would they have been willing to spend? Trust is built by spending time together getting to know each other, how many of these young people would have paid me per hour to sit and talk about life? To ask questions about how the stock market works and if they should choose an RRSP or a TFSA or both?

The most crucial financial discussion I had in my lifetime occurred when I was 14 years old and my mom’s financial advisor came to our house, sold Mom some life insurance and showed me why I should invest $50/month in the stock market. I’ve invested in the stock market ever since and watched my savings grow through ups and downs. But I never would have paid him an hourly fee to listen to him.

Several years ago, a client of our office was tragically killed in an unexpected and sudden boating accident. This client started his life -- and his relationship with our office -- with nothing. When he became a client of our office, he was in his early 20s, newly married with a young child, a big mortgage and a dream of taking over his parents’ farm. He took advice from our office and purchased life insurance and set up RRSPs for him and his wife. He didn’t pay us an hourly rate for that advice (he couldn’t have afforded it with so many obligations) and he knew we were paid by commission from his investments and for selling him life insurance.

When members of our office heard that he passed away on a Friday evening, one of our staff went to the office the following Saturday morning and started the process of filing his life insurance claim and notifying the investment companies holding his RRSPs and other investments of his passing. We did this because the survivors needed money fast and there were lots of forms to prepare. Survivors of a deceased loved one are under pressure to make some major decisions, and often are too overwhelmed to complete the paperwork. Our office spent more than 50 hours over the next month or so helping settle the estate. His survivors didn’t pay us out of pocket for our time.

We didn't charge an hourly fee when his widow cried in our office. We didn't charge when his two kids phoned us periodically to ask what to do with their inheritance, or stopped by over lunch to talk about what they were going through. We didn't charge when we ran into them at the local gym and local grocery store and they asked questions about income taxes and how investing works.

Seven years after his death, his family is doing well. The other day, his widow came into our office to invest a settlement her family received for his death. The sum of settlement is well into the millions. She listened to our advice and did what we suggested. She didn't ask how much we were paid, although we've told her in the past how our pay is calculated (as we do with all of our clients). The embedded commission on this money is significant, yes. However, she knows we need to get paid. She knows we've invested many, many hours in her family when she had nothing to pay us. She trusts us because she's been working with our office for almost 20 years.

Can you imagine having to decide what to do with the multi-million dollar settlement you received from your husband's tragic death by taking advice from someone that you pay an hourly rate to and therefore don't spend time getting to know? An hourly fee-for-service incents the advisor to drag out the process of giving advice, and incents the client to limit the time they spend listening to the advice. That creates a lot of pressure for the client, and may mean a lot of questions remain unanswered.

Embedded commissions actually work in our clients' favour – it puts the pressure on us, not them, to answer all of their questions and to thoroughly explain our solutions, because we don't get paid until they invest their money through our office. Until they make the decision to invest with us, they can spend as much time as they want talking to us. Financial advisors and registered investment advisers have no choice but to take the time to answer their questions, because if we don't our clients will find someone who *will* take the time – even after knowing each other for years.

All Canadians with a consistent income, no matter how modest, have the ability to save enough money to retire sometime in their 60s to the lifestyle they've become accustomed to if they listen to our advice. To achieve retirement, you have to start setting money aside at a young age, and you have to invest in equities that provide a good return. You also have to decide if RRSPs or TFSAs or both are right for you. You have to understand how they fit with LIRAs and RESPs and what happens to all of those savings vehicles if you die or get divorced or lose your job.

A good adviser also needs to not let you give in to your fears. There's lots of misinformation and scare tactics out there about investing. The media is full of them. So is the local coffee shop. Your neighbour, the accountant at your gym, and the realtor who got rich in real estate all have investment tips for you. Their tips are compelling, but none of the people giving those tips are trained in how investing in the stock market works.

Our clients know they can phone us anytime they have questions about something they saw on the news. They know they can walk into our office anytime (often without an appointment) and ask how their investments are doing and how current oil prices or Trump's presidency are impacting their hard earned savings. They can email us or text us whenever they have a concern. They can ask questions for clarification. And if they don't understand something, they can ask again.

We listen, we respond, we provide relevant resources all without an out-of-pocket fee. And we repeat, if necessary.

I pay a fee-for-service to my mechanic. I just spent $1100 for new calipers and brake pads to be installed in my car. The fee *didn't* include the mechanic's time explaining what was wrong with my car and what my options were. It included the parts and the time working on my vehicle. My mechanic took the time to explain to me what was wrong and what my options were because if he didn't, he knew I'd get my car serviced somewhere else – and he also knew I wouldn't pay him to tell me what's wrong with my car.

I also pay a fee-for-service to my tax preparer. I spend $80/hour. This fee *doesn't* include advice, either. It includes the time it takes for my tax preparer to file my taxes. He might have suggestions for how much I should set aside for income taxes next year and that I can reduce my income tax bill by investing in RRSPs, but he won't help me pick my investments and savings vehicles, or complete the paperwork to set them up.

I also pay a fee-for-service to my bank. I pay $14.99/month in bank account fees. This fee *doesn't* include advice on whether I should get a savings account or a TFSA or a chequing account. I have to decide that myself.

I pay a fee-for-service to my gym of approximately $400/year. This fee gives me full 24 hour access to gym equipment and exercise classes, but it *doesn't* include advice. I could pay an hourly fee to a personal trainer for advice, but like most people I don't, because I don't want to pay for it. I'd rather take the chance that I'm using the equipment incorrectly and injury myself (because it won't happen to me) than pay for it. Besides, I can Google how to use the equipment (even though I don't Google it because it's too much work).

One reason the CSA suggests embedded commissions aren't good is because the CSA thinks that financial advisors and registered investment advisers are paid more of a commission for certain investments than we are for other investments. In the words of the CSA, embedded commissions can

> *"Incent dealers and their representatives to sell funds that compensate them the best or focus on only those funds that include an embedded commission rather than recommend a more suitable investment product; specifically, they can encourage a push for higher commission generating funds, such as higher-risk actively managed funds, which can impair investor outcomes"*

This is only partly true.

All carriers pay us the same embedded commission for the same type of investment, so the commission we make isn't an incentive to choose one carrier over another, or even one fund manager over another. They have to pay us the same, or else all of us advisers would work with only the investment company that pays us the most.

Across all investment carriers, advisers are paid more to invest people's money in equities, real estate and balanced funds than we are paid to invest our client's money in bonds. But shouldn't we be? A financial advisor's job is to help people grow their net worth. Bonds don't keep up with inflation, and when outside of registered investments, are the least tax-efficient investments there are. Only equities surpass inflation, and are also more tax efficient than bonds (when non-registered) because they are taxed as capital gains and dividends. We should be encouraging our clients to invest in equities because that's where the long-term growth is.

Investing in equities is more work for my staff and I than investing in bonds, GICs and savings accounts. Our office has more compliance to do and we spend more time training our clients discussing how their investments work than we would if they were invested in bonds, GICs and savings accounts. We need to stay abreast of current news events and understand the impact of economic and political changes on the stock market so we can answer their questions. We need to be there for our clients when they have concerns about the market. None of that work needs to be done when people invest in bonds, GICs and savings accounts.

The CSA report also claims that embedded commissions can:

> *"Incent investment fund managers to rely more on payments to dealers than on the generation of performance to gather and preserve assets under management; this incentive can in turn lead to underperformance and drive up retail prices for investment products due to a competition between investment fund managers to offer attractive commissions to secure distribution."*

Embedded commissions don't incent fund managers to rely more on payments to dealers than on the generation of performance. This is because the embedded commission is paid on the amount of money in the fund which can only grow two ways: with increased returns and with people putting money into the fund. If the fund isn't managed well, the fund won't produce increased returns, and if the fund doesn't produce increased returns, people won't want to invest in it.

The CSA also claims that embedded commissions "inhibit the ability of investors to assess and manage the impact of dealer compensation costs on their investment returns". This doesn't need to be. If investment returns reported on a client statement show the returns *after* all fees are paid (the net return), then the client knows their returns. As long as the client gets the expected return, does it matter what the compensation is? A client is getting better value investing in a mutual fund earning 7% with a 2.5% MER than a GIC earning 2.5% recommended by an advisor he paid a $150 hourly fee to.

Another of CSA's concerns is that embedded commissions might "cause investors to pay (indirectly through fund management fees) dealer compensation that may not reflect the level of advice and service they may actually receive; the cost of the advice and service provided may exceed its benefit to investors".

It's true that the amount of advice received by clients might not perfectly reflect the amount they pay in embedded fees, but that's how it needs to be. Some clients need a lot of advice – such as the widow mentioned above, and my mom who found herself to be a single parent in her late 30s with no knowledge of how investing and insurance works, and the 18 year olds starting out in life. All of these clients get the advice they need because they don't worry about paying for advice out of pocket.

If embedded commissions are no longer an options for adviser compensation, clients won't get the advice they need because they won't pay their financial advisor a fee for service. We will see people's net worth decline in the coming decades. As people's net worth decline, they will become a liability to the government. Most people invest for retirement, and without enough retirement savings, they will be more reliant on programs like the Guaranteed Income Supplement, Old Age Security and Canada Pension Plan. This will cost tax payers billions of dollars in the future.

Finally, I must mention that I notice there are no financial advisors sitting on the Canadian Securities Administrators Board. As such, none of the CSA board members have any working knowledge of what registered investment advisers do on a day-to-day basis. Have you considered having at least one financial advisor or registered investment adviser on your board? It doesn't seem possible to me that you can make sound decisions about how I work with my clients without having done it yourself.

I did some research on the make-up of regulatory bodies in other industries. Physician in Saskatchewan answer to the Saskatchewan Medical Association (SMA), which has a board of directors and a representative assembly. The SMA requires that half of all people sitting on the board, the representative assembly and their committees be physicians. Shouldn't the CSA be held to similar standards? (For more information on requirements for being on the SMA board, RA or a committee, go here: http://www.sma.sk.ca/kaizen/content/files/Physician%20Health%20Program.pdf)

I trust that you will consider my words in making your final decision about removing embedded commissions as an option for payment. At this point, consumers can pay a fee for service if they want to, and they can also pay embedded commissions. Removing embedded commissions as an option will limit choice for consumers and will have a negative impact on their wealth in the years to come.

Sincerely,

Shannen Fisher, B.A. (Econ), CFP, CEA

Dear Sirs/Madam:

I am writing in response to the request for comments on the Canadian Securities Administrators Consultation paper 81-408 released on or about the 10th of January, 2017.

Who am I?

I am an enigma in the industry. I have been licensed to sell mutual funds for over 35 years in Alberta and have been operating my own mutual fund dealer since 1996. My understanding is that there are few mutual fund dealers operating in Canada who's head office jurisdiction is in Alberta. Primarily though, I am an investor using my own capital as my primary source of income. For example, I was the largest public shareholder in Companies such as Executive Inn Group which went private in 2007, H. Paulin and Company in 2013 and Morgan Financial in 1996. I currently own in excess of 10% of the voting shares of a public company GVIC Communications Corp. I have also been active legally by dissenting shares in Morgan Financial, Municipal Bankers Corp. and Dundee Realty when they went private respectively. RBC was able to enter the insurance industry by taking over Westbury Canadian from under Morgan Financial without any fair value calculation to protect the shareholders and Dundee was taken private below the independent "fair value" calculated amount. So I do what I can to protect my interests when I feel I have been wronged.

Mutual Funds are a Great Product

Looking back over my career I find mutual funds to be a great product to use in advancing an individual's savings over time. If you can compound your money at 5% per year over a long period of time on your savings you will do well. Do it yourself investing in stock and bond securities when done right can advance your savings at a much faster pace but the individual has to be diligent and do their own research. Or simply investing in a good performing closed ended fund can do well for investors with lower fees; or obviously just investing with Berkshire Hathaway or Fairfax Financial has made many investors quite well off. I have found setting up regular savings of even small amounts can lead to much larger amounts over time and this has been relatively easy to do with mutual funds for amounts as low as $25 or $50 per month. Similar to what Investors Group has been preaching since the beginning of time.

A Little History

I cannot compete against the position taken by the Canadian Securities Administrators (CSA) since I do not have the time nor the energy to answer their questions in the format put forth in their paper 81-408. But what I can do is share my experience over time in the industry as a client, salesman, investor and MFDA licensed dealer.

I attended my first investment presentation in 1981 when the Dow was less than 1,000 points at the time. I was enthralled. I personally purchased a term certificate paying 20% along with a portion of my investments going into an equity mutual fund after paying the 9% upfront fee in September of 1981. I ended up leaving the Chartered Accounting firm I was articling with in 1982 and embarking on a "career" marketing primarily term certificates, term deposits and mutual funds. We had a branch right next to the Royal Bank and as rates declined mutual funds became more and more popular with investors willing to pay up to 9% on the front end for equity funds and 5% on bond funds even though RBC was offering mutual funds without these front end loads. No matter what is believed, investing is an emotional decision not a logical one.

In 1987 with the stock market collapse I was witness to my office manager being "strangled" in front of everyone by a small female client whom he had continued to leverage as the markets were moving higher. The manager was fine but shaken. I have taken a "no strangulation" policy within my firm where the use of leverage is not only frowned upon but forbidden entirely. I was also caught up in the dealer firm I was with filing for bankruptcy protection in 1987 and from that day on have never sold a term certificate nor term deposit. The mutual fund investors were unscathed as they "owned" the funds. I was able to join an independent dealer and carried on with the remaining clients I had.

DSC Funds

Mackenzie brought out the Industrial Horizon fund in 1987 which was the first fund available in Canada to be sold on a deferred sales charge (DSC) basis. It was a sister fund to the highly popular Industrial Growth fund. I think assets quickly hit $1 billion leaving the Industrial Growth Fund which had a 20 year history in its wake. I found the independent firm I was with conflicting as they heavily promoted the use of the DSC sales structure. For example at a conference in 1990 I would quickly get surrounded by salespeople with calculators espousing the financial virtues of transferring my client's assets to DSC funds from the front end version I was using. I wasn't buying it. DSC funds are never in a client's best interest. No client in their right mind would choose a DSC fund over a no front end load equivalent. I recently asked one of my "senior" representatives why they did not use DSC funds anymore. His answer was brisk and sharp – he just knew it was not right. If the regulator continues to let mutual funds sold on a DSC basis exist then they are doing a disservice to Canadians. Mutual funds are primarily sold not bought so this puts the onus in the regulators hands to make the right decision.

Lowering Fees

With front end fees at zero advisors still need to be compensated for selling mutual funds and also holding on to client's assets through turbulent times. When trailer fees first came out I was relieved that I could focus more on my existing clients than having to spend time gathering new clients. In 1993 my firm even placed advertisements in the Financial Post advertising the no front end load sales model which was hugely successful. One of my representatives was even "interviewed" by Barry Critchley. Of course we try to find the best mutual funds for our clients as we always risk clients redeeming primarily due to poor performance. As a dealer and investor I am also aware how higher fees directly affect the returns my clients achieve. Do I believe fees are too high? You bet. Thankfully most manufacturers are lowering their management expenses on larger accounts. I also believe representatives should lower their fees but my understanding is that it is dealers themselves that are balking at this. They need to make a spread on their sales. My firm is not like this as I charge representatives a flat fee irrespective of their assets under management. I believe a reasonable charge would be a service fee of .50 % on equity funds and .25% on balanced and bond type funds. The higher fee is necessary on equity funds because it is much more difficult to hold a client in these funds when turbulence hits.

CSA's position:

Mark Armstrong, supra note 184. At page 6, Armstrong states: "Although the direct effect of a price cap is to reduce prices, the indirect effect of reduced search lessens each firm's demand elasticity so much that prices on average go up. This formalizes a claim sometimes made informally, which is that imposing price controls on an oligopoly market could raise equilibrium prices. One intuition for such a claim is that a price cap acts as a focal point for tacit collusion."

This is ridiculous. One of the easiest ways to ascertain when someone does not know what they are talking about is when they try to talk "over your head". Anyone speaking like this in front of me I would immediately dismiss as an insult to my intelligence.

Robo Advisors

To actually believe active management does not outperform passive is only a current "sales pitch". It soon will pass. While my chances at doing better than the average person at tennis who only wins 50% of his matches depends on the day and my opponent, there will be obvious winners and losers amongst money managers as well. Of course the higher the fees the more difficult it would be to perform well. Back when you could list all mutual funds available in Canada on a single piece of paper, four mutual funds stood out: the Cundill Fund, the Industrial Growth Fund, the AGF Special Fund and the Templeton Growth Fund. Of course these funds were relatively small but each fund averaged roughly 10% per year between 1974 and 1984 when the markets were basically flat.

CSA's view:

…embedded commissions can incent dealers and their representatives to sell funds that compensate them the best or focus on only those funds that include an embedded commission rather than recommend a more suitable investment product; specifically, they can encourage a push for higher commission generating funds, such as higher-risk actively managed funds, which can impair investor outcomes.

If the regulator sees a world where passive investing will outperform active then I will definitely become a dinosaur in the industry. As stated previously, mutual funds are primarily sold not bought. Clients will and do prefer to pay a sales fee imbedded or otherwise to get advice. If I was to sell only passive low commission funds for free I would quickly look for other employment and the industry would also have difficulty retaining any quality salespeople.

My Fear of Unembedding Trailer Fees

I absolutely hate bank charges. The same $19 a month shows up on my statement every month unless I maintain a certain balance in my account. My fear is that if clients are charged monthly service fees outside of the fund they will be constantly reminded of the fees they are paying. When times are good there should be no problems but when the market fall which they will do then this charge might be enough to make the client redeem. As everyone knows, these redemptions primarily occur at the bottom of the market not the top. This would be a disservice to them.

Language is an Issue

While a fully informed client is preferred, the regulator must understand that investing in itself is a language that is not easily understood by the public, advisors, nor some manufacturers. I was at a recent investment conference in Banff hosted by the Franklin Templeton Group of funds. While I was interested in some speakers I had a difficult time understanding the alpha, beta and gamma that the fund manager was talking about as crucial for their fund to do well. He might as well have been speaking Spanish. I was more interested in seeing if one of my holdings, Ithaca Energy would do a compulsory buyout of the remaining shareholders. If I was right, the shares I could buy at $1.55 would be bought out soon at $1.95 based on Ithaca taking up 92% of the outstanding shares already.

Now I bring this up because this is relatively simple for me because I know the language and have been involved in a number of takeover deals in the past. I would say this fund manager is actually clueless on managing his fund which I would never recommend to any client. But the advisors in the room do not know this. At another conference put on by Mackenzie on the 24th of May I attended a presentation by their lead fixed income manager who did not even mention the yields on the bonds within his fund. To say that the emperor has no clothes on would be an understatement. At least he had on a good suit.

Investing is never easy but it is made all the more difficult by the fact that new funds are increasingly brought out as new funds without a track record are more exciting than older funds. And poorer performing fund tend to perform better than current 5 star funds due to a “reversion to the mean” but everyone goes off a fund’s current track record for comfort.

Direct Sales of Funds

If the regulator believes investors are better off with a direct sales model where the client buys directly from the manufacturer and more “aligned” I doubt this is the case. As an advisor and dealer I want the clients in funds that perform the best along with a high degree of security. That way my client is happier and will keep his investments with me, maybe invest more and likely will be a good source for referrals. Doing the opposite just means I am shooting myself in the foot eventually and risk losing the client forever.

Altamira went direct a number of years ago and gathered many assets due to their star manager Frank Mersch. Dare to say, the experience was likely not that good for clients who are attracted to better performing funds even though they rarely see the future risk they are assuming with the outperformance. Altamira, alas, had to sell themselves off while they still had some assets as redemptions became rampant. I would say the experience will be similar to any other firms that plan to or are currently selling direct now.

My Recommendation

Funds sold on a DSC basis are a bain of the industry. Getting rid of this sales practice would go a long way in lowering the administrative costs of dealers and manufacturers and obviously clients would be better off not being trapped in a product. If a client holds a front end fund today he or she is always free to move it should they believe the performance of the fund is lacking, or move the fund to another representative or dealer if they feel their account is not getting serviced properly.

Lowering trailer fees by having them negotiated between the representative and client should do away with conflicts and also improve the transparency of these fees/charges. I do not see much difference between having the fund companies charge trailer fees on a regular basis by selling client fund units and charging these amounts internally. I just do not think it is in the client's best interest to keep reminding them of the fees especially when the markets drop. Mutual funds are a great product and I have seen many financial "successes" over the past 35 years that may not have been possible had the client been given more incentive to redeem at the wrong time in the market cycle.

Re: **CSA CONSULTATION PAPER 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS**

I am an investor. A significant portion of my portfolio is invested in mutual funds. I am compelled to provide feedback on the above consultation paper. As I am not a fund manager, dealer or advisor I cannot respond to many of the questions in the consultation paper. However, I offer my overall perspective on some of the key matters being raised in the consultation paper. My points of interest are:

1. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors.
2. Embedded commissions limit investor awareness, understanding and control of dealer compensation costs.
3. Embedded commissions paid generally do not align with the services provided to investors.
4. The requiring of disclosure of the actual dollar amount of fees paid and returns foregone. The CSA chose not to proceed with this option as it does not anticipate that it will have any measurable effect in addressing any of the other investor protection and market efficiency issues identified by the CSA.

I offer the following perspective on the above four points.

Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors.

This matter has been of concern to me, and other investors I have spoken to. This is an obvious conflict of interest that has the potential for increasing the value of returns foregone due to investments in underperforming funds offering higher commissions to dealers and advisors. The elimination of embedded commissions including such incentives as ongoing trailing commissions and upfront sales commissions would be beneficial in ensuring dealers and advisors remain focused on providing services that benefit investors.

NOTE: Although not discussed in the consultation paper, there is the matter of fees being based as a percentage of the value of the investment in a fund. It is unclear to me how a fund manager can justify an increase in dollar value of fees based solely on the value of the investment. A doubling of the value of my investment in a fund does not double the cost of managing that investment.

Embedded commissions limit investor awareness, understanding and control of dealer compensation costs.

The myriad options of embedded commissions are overwhelming for the lay person investor. Even with ongoing interaction with investment advisors, it is difficult to comprehend what fees are being paid and for what purpose. The introduction of clear and simple fees for service would offer the average investor the opportunity to make informed decisions on investment options. Fee based series of mutual funds provide a methodology for compensating dealers and advisors. The amount paid should be based on what level of service the dealers and advisors provide to investors.

Embedded commissions paid generally do not align with the services provided to investors.

Presently, the services provided by my investment advisor are superior to past experiences. However, this is mainly due to the character of my investment advisor and not a reflection of the embedded commission structure presently in place. My experience with past advisors certainly suggested that their services did not align with the embedded commissions they received. Analysis of past performance of my portfolio and a straightforward review with a knowledgeable and principled investment advisor identified obvious shortcomings in service delivery. The elimination of embedded commissions could provide an opportunity for improved service delivery based on clear and simple fees.

The requiring of disclosure of the actual dollar amount of fees paid and returns foregone.

The CSA has chosen to not pursue this option. It is puzzling to me why that position has been taken. Although explained in the consultation paper, it does seem to me that the reasons for not pursuing this option are somewhat weak. The reasons include such matters as limited benefit to investors and potential significant costs for implementation.

It is my opinion that there is significant benefit to investors. Namely, knowing exactly how much of my money is being used to manage and administer the fund. Not an MER that I use to attempt at calculating an estimate of fees paid to a fund manager. It is unreasonable to expect an investor to have to perform some form of calculation to determine an estimate of fees paid. Full disclosure, as now required of dealers and advisors, is fundamental in building trust from investors.

To exacerbate the matter, the media has been inundated with advertising from regulators encouraging investors to ensure they know the fees they are paying. The ads are structured in such a manner as to indicate that full disclosure is now required. However, it is not – only the dealers and advisors portions are being disclosed. Not the fund managers. This is confusing in the least and deceitful at its worst.

Further, it is my view that the cost for implementation may be overstated. At present, it is my understanding that the fund managers have the information for each investor in any fund. That is, the fund manager knows how many units I hold in a fund. Additionally, in general the fund managers calculate their fees daily and collect those fees monthly. Although not trivial, I do not believe the cost for manipulation of this data to report individual investors' fees is prohibitively expensive.

Lastly, fund managers should be held to the same standards as dealers and advisors. There is no place for regulatory oversight that establishes a higher standard of disclosure for one portion of the investment industry and not the other. Full disclosure should be just that. It is the only manner in which the average investor can maintain a sense of control on investment decisions impacting portfolio performance.

Sincerely,

Robert Bernard

Re: *CSA Consultation Paper 81-408 – Consultation on the Option of Discontinuing Embedded Commissions*

Dear Sirs/Mesdames:

Citibank Canada Investment Funds Limited ("**CCIFL**") appreciates the opportunity to provide comments to the Canadian Securities Administrators (the "**CSA**") on CSA Consultation Paper 81-408 – *Consultation on the Option of Discontinuing Embedded Commissions* (the "**Consultation Paper**").

About Citibank Canada Investment Funds Limited

CCIFL is a wholly-owned subsidiary of Citibank Canada, a Canadian chartered bank, which is in turn an indirect subsidiary of Citigroup, Inc. CCIFL is a registered portfolio manager and exempt market dealer in eight of the provinces of Canada, and a registered mutual fund dealer in Ontario and British Columbia. CCIFL sells securities of pooled investment funds to institutional and high net worth individual clients of Citibank Canada on a private placement basis and through accounts managed by CCIFL under the terms of an investment management agreement.

__Comments on the Consultation Paper__

CCIFL recognizes the potential investor protection and market efficiency issues arising from the prevailing practice of remunerating dealers and their representatives for mutual fund sales through commissions, including sales and trailing commissions, paid by investment fund managers ("**embedded commissions**") and supports the consideration of different compensation models. However, CCIFL submits that the potential option of discontinuing embedded commissions and transitioning to direct pay arrangements should not apply: (i) to investment funds sold in the exempt market under the accredited investor exemption set out in section 2.3 of National Instrument 45-106 *Prospectus Exemptions* (the "**Accredited Investor Exemption**"); (ii) in particular, to investment funds that are sold under the Accredited Investor Exemption to the category of investors defined as "permitted clients" in section 1.1 of National Instrument 31-103 *Registration Requirements, Exemptions and Ongoing Registrant Obligations* ("**NI 31-103**") ("**Permitted Clients**"); and (iii) above all, to exempt foreign investment funds sold to Permitted Clients.

The focus of the discussion in the Consultation Paper is on "mutual funds that are reporting issuers and members of the organization of such mutual funds". CCIFL supports the consideration of alternative fee arrangements for mutual funds that are Canadian reporting issuers. All such funds are subject to the same regulations, and, therefore, a change in compensation arrangements will apply to all issuers equally and would be unlikely to have an adverse effect on competition, investor access to these mutual funds or to investment advice from dealers of these mutual funds. However, the Consultation Paper also states (*emphasis added*):

> Recognizing that the fee structure of various types of investment funds and structured notes commonly includes embedded commissions, and with the aim of promoting a level playing field amongst comparable investment products and limiting opportunities for regulatory arbitrage, we currently anticipate that any regulatory proposal to discontinue embedded commissions would affect:
>
> - an "investment fund", as defined under securities legislation and
> - structured notes,
>
> whether sold under a prospectus *__or in the exempt market under a prospectus exemption.__*

__Accredited Investor Exemption__

CCIFL submits that any discontinuation of embedded commissions should not apply to investment funds sold in the exempt market under the Accredited Investor Exemption. The Accredited Investor Exemption only allows sales to sophisticated, typically institutional, investors with sufficient financial knowledge and investment experience to understand and take on the risks associated with certain investment offerings. These investors have access to complex and higher-risk investments that are not available to a typical retail investor. As such, CCIFL believes that the objectives of promoting a level playing field amongst comparable investment products and limiting opportunities for regulatory arbitrage would not be undermined by permitting embedded commissions for investment funds sold in the exempt market

Exempt Foreign Investment Funds

CCIFL submits that any discontinuation of embedded commissions should, above all, not apply to foreign investment funds that are sold to Permitted Clients in the exempt market. Foreign investment funds that are not Canadian reporting issuers are not subject to Canadian regulations and may be permitted to continue embedded commissions pursuant to regulations in their home jurisdiction. The discontinuation of embedded commissions will prevent sophisticated Canadian investors who fall into the category of Permitted Clients from investing in such foreign investment funds, limiting their available foreign investment options.

It is desirable for Permitted Clients in Canada to have cost-effective access to global investment products, thereby necessitating effective access to the brokers and dealers entitled to trade and provide advice in respect of such investment products. These brokers and dealers may be regulated in foreign jurisdictions, many of which permit embedded commissions as a form of compensation. By discontinuing embedded commissions on investment funds sold to Permitted Clients under the Accredited Investor Exemption, the CSA will effectively preclude access to certain foreign investment products and to the advice of brokers and dealers entitled to trade such investment products.

The CSA has recognized that over the years there has been an increasing interest in, and opportunities for, investment in foreign securities by sophisticated Canadian investors. For example, with the implementation of NI 31-103 in 2009, a structure was put in place for facilitating access by sophisticated clients to trading of foreign securities through foreign dealers that satisfy the international dealer registration exemption in section 8.18 of NI 31-103. CCIFL submits that discontinuing embedded commissions on foreign investment funds would limit the investment products available to Permitted Clients in Canada and may prevent such Permitted Clients from accessing the expertise of foreign dealers of such investment funds.

CCIFL submits that certain benefits of embedded commissions, such as access to advice of foreign dealers and heightened competition for foreign investment funds, may outweigh the issues or harms of embedded commissions in these particular circumstances.

Thank you for providing me with the opportunity to offer my thoughts on Consultation Paper 81-408. This is quite possibly the most important piece of regulatory reform that the Canadian Financial Services industry has ever faced. It is obviously important that stakeholders work hard to 'get it right' and to consider the range of possible outcomes when weighing alternatives.

I'd like to begin my comments with a pre-emptive observation about the terminology that is used in this paper and in other papers that are similar in tone and substance. This is in regard to the loose application of the term "unintended consequences" – at least in regard to the entities that offer their comments. Specifically, I believe more explicit clarity ought to be provided regarding the true intent of possible consequences. As such, I'd recommend simply using the less-judgmental term 'consequences'. In short, what matters about public policy changes are the consequences of actions taken – whether they were intended or not. For example, there might be a broad agreement that certain reforms might reasonably result in a reduction in the number of advisors offering financial advice. Some commentators might think this is a potentially positive likely outcome, while some stakeholders might see it as being a potentially negative outcome. What matters here is the outcome itself, not the terminology of how that outcome is to be positioned (whether the outcome is intended or not is largely and inherently a value-judgement). Stated differently, the same facts / consequences could be characterized differently depending on who is making the submission. Some might say that an outcome is positive (i.e. an "intended outcome"), while others might say (for example, decline in the number of advisors) is likely to be negative (i.e. an "unintended outcome"). My simple point is that the word "unintended" can be manipulated. It is often used as a synonym for words like "unfortunate" or "unpopular" when in actual fact, unintended consequences are simply those that people might not reasonably foresee.

By way of clarification, I believe the potential reduction in the number of advisors is both likely and positive. To me, it is neither here nor there whether that potential outcome was intended or not. It simply is. Furthermore, I believe it is an outcome that most reasonable people who understand the situation would reasonably foresee. As such, it would be disingenuous, in my opinion, to portray the consequence as "unintended". The term "unintended" implies that you didn't see the consequence coming – irrespective of whether that consequence is positive or negative. That's simply not the way many commentators use the term.

***

Please note that while I work as a portfolio manager at an IIROC member firm, I am nonetheless functioning as an independent contractor and the views expressed in this document are strictly my own. None of the comments that follow should be misconstrued as representing my place of employment. I will allow those people to speak for themselves just as I am speaking for myself.

For greater detail, I ask that the people reading this submission refer to my book <u>The Professional Financial Advisor IV</u> for more detail – especially chapters 4, 5 and 10 through 15. I provided copies of my book to both Dennis Yanchus and Chantal Mainville of the OSC in late 2016.

***

Rather than go into an inordinate amount of detail at the outset, I feel it would be best for me to answer the specific questions that are posed throughout the body of the consultation paper and to offer a summary and final overview once I have done so.

Therefore, my answers to your specific questions are as follows:

1. Yes. I feel the issues are essentially self-evident.
2. While not noted expressly in the introductory section, a key problem is the competitiveness of other products and investment alternatives. Stated differently, the opening section seems to deal with how embedded compensation can skew recommendations relative to competing products that pay lower commissions. However, there are a number of competing options (ETFs come to mind) which are often superior, cheaper, more transparent (regarding underlying holdings) and more tax effective (due to generally lower turnover) which are not expressly referenced at all. To my mind, the bigger problem is one of recommending the best products available; not merely the best products from among those that might pay an embedded

commission. My experience is that for many (mostly MFDA) advisors, the surest way to find your way off the product shelf is to have a product that does not offer embedded commissions. If one takes the view that mutual funds, in particular, are sold; not bought, then it should logically follow that registrants will likely prefer those products that are 'easy to sell'. In short, the 'other harms' that you ask about include foregone opportunities to substitute superior products into clients' portfolios in lieu of those that pay embedded commissions.

3. The short answer is 'no'. The longer answer is that concepts like 'access to advice' are red herrings. Changing how one pays for advice has zero economic impact on how much one pays.
4. The short answer is 'yes'. Normally, answering 'yes' would involve a non-response to corollaries a and b, however, I feel I need to respond at any rate. I have nothing to add re: a, but I do believe that, further to b, there is a real risk of regulatory arbitrage if embedded compensation is discontinued for some products and not others. Ironically, you have asked for empirically evidence in this paper. However, the nature of this question means that people will be required to offer their best guesses in light of the obvious lack of clear evidence regarding potential outcomes. I have heard a considerable amount of anecdotal evidence (some of which may have come to light after this discussion paper went to press) that many dual licensed registrants (both insurance and funds) were moving their practices toward segregated funds precisely because they did not want to be held to the standards set out in CRM II. If that trend is even modestly apparent due to CRM II, it would likely be highly apparent if embedded compensation was discontinued for mutual funds, but not segregated funds.
5. The simple answer is 'no'. This sort of policy would work best in a world where there is a level playing field and all participants (including discount brokerages) charged separately for the advice they give…. or are prohibited from charging in those instances where they expressly offer no advice whatsoever.
6. In my view, all manner of embedded compensation ought to be discontinued as per my previous response. There should be no exceptions. Embedded compensation should be discontinued across the board.
7. Yes, I agree. It simply maximizes transparency, minimizes bias and goes much further in exploding the (still prevalent after CRM II) myth that financial advice is "free".
8. Other compensations need not be under consideration for discontinuation at this time. As has been noted by the Brondesbury and Cumming Reports, embedded compensation compromises recommendations and creates an environment that can fairly be described as having advisor bias. Although I have personally not seen any research regarding advisor bias being caused (or even exacerbated) by the types of compensation noted in the original question, I do not believe it would be particularly material even if it did exist. Furthermore, some elements (small token gifts) will be difficult to monitor and might be open to interpretation if enforcement was attempted). If a limit is $100 and a company gives an advisor a golf shirt that cost $50 to manufacture, but that retails for $120, was the limit exceeded? Better to stick with the major concerns rather than getting involved in minutiae. The possible exception here is underwriting commissions. At present, some firms allow advisors to double dip – either by buying new issues directly into fee-based accounts or by buying them in commission-based accounts and then transferring them into fee-based alternatives. To my mind, the surest way to end this abusive practice – which is clearly contrary to the spirit of the regulations even if it is not always clearly contrary to the letter – would be to remove all embedded compensation from new issues.

9. In my opinion and further to the answers given to question #8 above, the answer is 'no'.
10. I have very limited experience regarding the questions asked in this section and, as such, I will refrain from commenting.
11. The idea of simplified payment remittances lies at the heart of making embedded compensation disappear, in my opinion. Too often, stakeholders come forward with the ridiculous positon that paying separately would cause clients to leave their advisors and create an "advice gap". This is total rubbish. Assuming all else to be equal, the amount being paid would be unchanged whether the payment is made via the payment of trailing commissions, the payment of direct and separately charged fees or the liquidation of pre-existing holdings to pay the fees. The quantum of payment does not change simply because the method of collection and remittance changes. The explanation that I like to use is that one dollar does not cost more than four quarters. The extent to which people refuse to pay for separate, transparent and duly itemized fees seems to be dependent on the extent to which they understand how and how much people pre-existing payment methods cost. Correlation is not causation. Certain groups would have people believe that charging separately makes advice less attainable. In fact, it simply makes the cost of advice more transparent. People refuses to pay not because they cannot do so (indeed, the cost of advice is unchanged), but because they are now being shown (in many instances for the first time) in a clear, unambiguous way just how much financial advice costs. The industry says it favours disclosure and transparency, but that is not strictly true. My experience is that certain stakeholders make disclosures only to the extent that they meet their (modest) regulatory obligations. In so doing, they are obviously not gaining an informed consent from their clients, because those same clients often refuse to pay when they are made to understand that financial advice is not "free". Facilitating payment (for instance, by redeeming units of mutual funds) would mean that those people who do not wish to pay separately could be accommodated seamlessly.
12. Categorically yes.
13. There needs to be a CRM III sort of disclosure that begins either prior to or concurrent with the ending of embedded compensation whereby consumers are told explicitly (in yearend dollar terms) how much their investment products cost. $100,000 in a front end equity fund with a 2.4% MER currently notes that compensation to the advisor and firm is (typically) $1,000 annually. It does NOT note that there is an additional $1,400 product cost being borne by the investor. In short, the quantum of product cost and the importance of product cost are not salient considerations for most retail investors. They ought to be. Making the information transparent is akin to making it salient. The entire challenge is to help investors make informed decisions. As such, the principle of informed consent needs to be championed and all means available to apply the concept should be utilized.
14. The answer to the conflicts of interest question depend on how the transition takes place. The devil is in the details, as they say. For instance, if an advisor could make more money using one format over another (if there is a period when both are at least somewhat available), one ought to expect the system that pays the advisor more to be the system that is recommended – all else being equal. Assuming all inherent conflicts can be eliminated (or at least honourably controlled for), I would not anticipate any problems.

15. In my opinion, the answers are/ outcomes will be as follows:
    - The will indeed be a greater alignment of services, products and overall advice.
    - The change will likely provide a moderate boost to the adoption of online services. The ramifications are likely too difficult to predict given the lack of statistically significant evidence on the subject. However, recent studies (Dalbar QAIB and the recent report from Morningstar Inc. of Chicago have found that mutual fund performance experienced by average Canadian fund investors is often worse than that of the funds they hold). As such, online and "robo" offerings may well gain increased acceptance as people come to understand the importance of managing both product and advisory costs and investor behavior as primary determinants of investment outcomes.
    - Discretionary is likely to increase as well. As a portfolio manager, I can tell you that my decision to offer discretionary series was driven by a different consideration – the desire to be held to a fiduciary standard. I made the decision to offer fee-based advice more than 15 years ago. Offering discretion is a logical extension of that earlier decision, which was nonetheless motivated by the principles set out in your paper: transparency, lower product cost and the breaking of the link between products recommended based primarily on preferred advisory business models.
    - Discount brokers are also likely to grow as a result of this change, but my suspicion is that the difference here will be relatively modest. The only real reason why people might switch to a discount broker as a result of the changes in 81-408 being enacted is that it might be cheaper to buy mutual funds by advoiding otherwise embedded trailing commissions. Anyone who is inclined to use a discount broker, but not mutual funds would likely be unaffected.
    - The cost of advice will be more granular as a result of unbundling. Specifically, small investors will likely end up paying moderately more for advice (but will likely be able to save a greater amount in lower product costs). Larger accounts (for instance, those over somewhere between $500,000 and $1,000,000) will likely pay the same or less for qualified advice. I would not expect a change in compensation methodology to lead to a material change in the services being offered. People generally do what they like and / or are comfortable doing – irrespective of how they are paid to do it.
16. In general, I would not expect broker/ dealers to offer different payments based on the segmentation of clients (for instance based on age, income, gender, profession, etc.). The primary means of segmentation will likely continue to be investable household assets, with a sliding scale being offered to offer competitive pricing for more desirable affluent households.
17. This proposal will absolutely, positively NOT result in an "advice gap". Changing how one pays does absolutely nothing to change how much one pays (*ceteris paribus*). A dollar does not cost more than four quarters. In particular:
    - Smaller investors are the ones least likely to pay – but only because they still do not (by and large –even after the reporting being done in CRM II) understand how and how much their advisor (and advisory firm) are being paid. Those who "refuse" to pay are largely oblivious to the **fact** that they have been paying for advice (often at similar or identical dollar amounts) all along.
    - I agree with the definition, but do not believe it will be manifested in the way that those who have expressed a concern about it would have people believe.

- There should be absolutely no distinction between face to face advice and 'robo' advice. This is especially true since there is no evidence (that I have seen, at any rate) that demonstrates the superiority of one format over another. Presumably, the distinction would be made on the premise that one kind (humans would always have the public believe they are better than pre-programmed algorithmic robots). Increasingly and in virtually all walks of life, artificial intelligence is disintermediating and disrupting pre-established business models. The onus is on those who claim the disruption is harmful to demonstrate that claim. To date, I have seen no such evidence.
- The things that would be most affected are mutual funds offered through discount brokerages and mutual funds offered to low-end (under $100,000 in household assets) families. Discount brokerages will be more compelling for DIY mutual fund investors. Many of the advisors serving small accounts insist that they add value through constructive behavior modification (i.e. encouraging higher savings rates). While possibly true, it might be equally true that 'robo' advisors are even more valuable (i.e. encourage the exact same behavior to the same extent, but at a lower cost). Again, I believe it is too early to say one way of another, but to suggest that the human approach is self-evidently superior is silly. Humans are the 'devil we know'. Presently, we simply do not know how effect 'robo' advisors might be in helping people to deal with their heuristic shortcomings. Time will tell.
- I do not believe the interplay between this initiatives or others will make for a material change (either better or worse) in the advice gap because I simply do not believe that there will be an advice gap.
- There is no need to mitigate things that do not exist. What are we doing to protect ourselves from a Martian attack?
- The short answer is 'no'. If anything, the expansion of online advice will serve to further democratize access to advice because the cost of advice with product implementation through 'robo' advisors will be the cheapest delivery mechanism available. Remember this: price is what you pay; value is what you get. In order to offer even comparable value, humans need to offer better advice, because the cost of 'robo' advice is lower than the cost of human advice. To my mind, 'robo' advisors represent an exciting and positive alternative for households with less than $100,000 in investable assets.
- I do not believe an advice gap will develop, but I fail to see how the concentration of advice offered by a particular channel (for instance, banks) would have an impact if it did develop.

18. Directionally, the industry would continue to transition toward unbundled formats at any rate. The issue here, however, is one of magnitude, not direction. Moving from 10% to 20% unbundled or from 20% to 25% is all fine and well, but if the pre-eminent problem is one of advisor bias, then that directional movement to (say) 25% unbundled would still leave 75% of the advisor population subject to bias-laden advice as a result of the harmful effects of embedded compensation. This matter is too important to leave to self-selection. Do police forces simply "encourage" people to refrain from drinking and driving without providing sanctions for those who fail to comply? Moral suasion is not nearly a powerful enough lever to cause such a necessary and fundamental shift to take place. Stronger measures are clearly in order.
19. Accepting that the depiction is necessarily general in nature, I believe the depiction set out in Figure 8 are reasonable. I would expect the industry to continue to evolve and migrate toward

higher end services and fees structures with algorithmic alternatives taking up the slack for the low end advisors and the clients they serve.

20. The only obstacles that exist are those that are implicitly imposed by dealers themselves. For instance, many vertically-integrated MFDA firms have been slow to offer true fee-based platforms. If they did, advisors might use them. But if advisors used them (i.e. substituted high-cost products for low-cost products in favour of their clients), it would hurt their employers. Employers call high-cost products “high-margin” products. To the extent that employers can delay the adoption of technologies and trading platforms that might be in their clients’ best interests, they effectively maintain the status quo. Since most advisors at MFDA firms are more loyal to their employers (who defend their mutually-beneficial compensation models), only a modest number of would –be early adopters press for change. These people are quickly and easily marginalized as “troublemakers” when the prospect of real change is put on the agenda.
21. For purposes of this discussion:
    - I absolutely believe that industry consolidation will continue – and likely accelerate.
    - Consolidation is likely a positive development since it will leave only the largest, most well-capitalized firms standing. This, in turn, should provide greater stability and possibly even more compelling economies of scale for those people who would use these services (i.e. ordinary investors).
22. The challenges are likely to be as follows:
    - Independent dealers – operational and compliance-based in nature
    - Independent fund manufacturers – nothing but pain. They will lose market share and will have lower margins on the assets they retain
    - Integrated financial service providers – will likely fall somewhere between the two groups above depending primarily on whether they are more like the first group or the second
    - Mutual fund dealers – see Independent Fund Manufacturers
    - IIROC dealers – largely impervious. These firms have already gone through the necessary changes. They will sit back and watch the disruption that is about to hit the low (and perhaps even middle) segments of the market.
    - Online/discount brokers – will lose (most of) the cash cow of mutual fund trailing commissions, but otherwise be unaffected.

    - Regulatory arbitrage is likely to occur in the first few years. The extent to which it occurs depends primarily on relative timing. If there’s a sense that there will be a long (say - 4+ year) lag between eliminating embedded in mutual funds and eliminating embedded in segregated funds, many near-retirement advisors (in particular) will simply make a modest change to their product mix in order to avoid having to make a more drastic change to their business model.
    - Dually-licensed registrants might be the most inclined to engage in product arbitrage. The major impact for them would be to have to re-paper their clients using insurance application forms. I have little insight to the other parts of this question.
23. I am unaware of any back-office limitations, but would caution you that some people (read: me) suspect that many firms opposed to this potential change will make excuses and suggest that technological and / or operational change will be too difficult to implement. The challenge, of course, is that claims of this sort are difficult to reliably confirm or refute (which, of course, is

precisely why they are made in the first place). The need for controls and oversight would simply change. Going forward, the need would be to ensure that clients were not being overcharged in some manner. At no point would any reputable person recommend not providing meaningful oversight with so much money at stake.

24. The short answer to your question is "of course". Once again, four quarters is neither less than nor more than one dollar. Changing how one pays ought to have no impact whatsoever on how much one pays. To the extent that it does (or to the extent that people allege that it does or that it has in the past), the reasons are pretty much entirely rooted in the parties not understanding how (and how much) they were paying in the first place. No rational person would be opposed paying the same amount in a different format.
25. Some ultra-progressive advisors (not entire firms) might move to a mixed model with a base retainer fee and an asset based fee on top. It guarantees a minimum annual income and often has specific (often annual) deliverables attached to the offering. This would likely round to zero as a percentage of the advisor population, however.
26. To my mind, the impact on representatives will be as follows:
    - career path – the industry will be more professional in the future. Much like young dentists entering the business, there would likely be an increased opportunity to buy a practice and to pay the retiring advisor out of the cash flow of that practice over a number of years
    - attractiveness of the job – massively positive. This is one of the very best career options available. It should do a better job than ever of attracting the best and the brightest.
    - typical profile of individuals attracted to the career – commensurate with a new doctor or accountant or engineer
    - recruitment – turning many good people away because there are only so many new spots / retiring advisors to go around
    - relative attractiveness of careers in competing financial service business lines – the top of the pyramid
27. My sense is that the mitigation measures being contemplated would do a good job of ensuring that access, choice and a level playing field are maintained for clients in all circumstances.
28. There are no other measures that I can think of that might help.
29. At the beginning of this document, prior to answering the specific questions, I made the point that "unintended consequences" is a bit of a loaded term since it's applicability depends primarily on what one's intent was in the first place. My example (again) is in regard to the population of advisors. I believe we have too many. As such, I believe that a reduction in the advisor population would be an extremely positive development for consumers – especially small consumers. As such, a reduction in the number of advisors would, to me, be both expected and intended. Most of all, it would be welcomed. Other stakeholders would likely point to a similar fact pattern and allege that these consequences would be a bad thing. In short, "unintended consequences" has become code for "bad thing". I simply disagree with this usage. The adjective is redundant and value-laden. These future outcomes should simply be called "consequences". The same goes for the word "choice". More choice is not necessarily better choice. Adding an inferior choice to a pre-existing menu that was entirely adequate is of not utility (and likely has a clear disutility) to those doing the choosing. With that out of the way, my view is that all consequences would be of the minor variety and could be dealt with relatively easily and purposefully.
30. My views are as follows:

a) Using a 1% trailing commission as a baseline, I will use my own fee schedule as a guide regarding the cross-subsidization of clients. My fees are 1.4% on the first $250,000; 0.8% on additional assets up to $1,500,000 and 0.5% on assets above $1,500,000. Accordingly, my fees are:

$250,000 – 1.4%; $500,000 – 1.1%; $750,000 – 1.0% (the point of indifference); $1,000,000 – 0.95%; $1,500,000 – 0.9%; $2,000,000 – 0.8%. Anyone who has an average client with less than $750,000 in investable assets would actually increase their revenue. This is also good news for the profitability of broker-dealers.

b) The short answer is "yes". Although my personal break-even point is $750,000, I also pass along product savings of about 1% relative to other market participants (MFDA registrants in particular). My experience is that clients with $500,000 to invest would gladly pay an advisor 10 bps more if that advisor had the decency to use product that cost the client 100 bps less. That's still a net saving of 90 bps ($4,500 annually on a $500,000 account) to the client family.

c) I'm unsure of what is being asked about eliminating a cross-subsidy. Nonetheless, I believe it might be useful to provide mandatory information to all clients with over $500,000 in mutual funds that they could realize substantial savings if they were to switch to a direct pay method and to using other products (e.g. ETFs and individual securities) as compared to their current product mix.

31. The industry could engage in a period of hyper-disclosure with a clear two page document given to all clients with embedded compensation that offers a clear, concise explanation of the change that can be easily understood (and not manipulated by unscrupulous people who continue to insist that advice is - and always was - free). This could be similar to the Client Relationship Disclosure documentation that became mandatory after the introduction of CRM I. Written client disclosure verifying that the documentation has been received would ensure that facts could not be misrepresented.
32. Transition options depend very much on the individual practice. It would be extremely difficult, in my opinion, for anyone to offer general advice on the topic of transitions, since various advisors will be at varying stages of readiness and so their clients will have different (both in identity and in magnitude) challenges in adjusting to the new order. Flexibility is paramount. My view is that an appropriate transition period would involve a clear deadline set out in 2017 with clear intermediate steps along the way. For instance, it could be announced that embedded compensation would end on December 31, 2020. It could be further announced that until that date, all funds sold with a back end load would need to have their penalty period expire on or before that date. A fund sold in 2018 might only have a 2-year DSC penalty and a fund sold in 2019 might only have a one year penalty. Funds sold in 2020 might carry a trailing commission, but would no longer be able to have a DSC of any kind. Finally, if technology allows the industry to reliably identify funds with embedded compensation (i.e. via discreet fund codes), then there could be a period where embedded funds and unbundled funds co-existed in client accounts, provided that there was a reliable way to avoid double-dipping (i.e. to ensure that only F Class funds attracted an advisory fee).
33. My dream would be to have all embedded compensation gone from Canada as we begin 2021. It is, to me, the first reasonable opportunity to do away with embedded commissions.
34. No caps should be placed on embedded commissions other than the elimination timeframes I noted above.
35. I believe the steps under consideration are sufficient.
36. There are no other alternatives that I can think of.

Thank you for your time and consideration. The exercise is a useful one and I'm sure you will be receiving a number of thoughtful responses to this important matter. Even though I strongly support the general thrust of this paper, I cannot help but wonder why it has taken so long for us to come this far. I was involved in the Fair Dealing Model Consultations over a decade ago.

Given my tenure on this file, you might imagine that there are some things that I find disheartening about the exercise. The consultation paper asks that commenters not re-hash previously-made arguments, but rather answer the pointed questions that the paper asks using demonstrable facts. The question that this begs is: “where was the insistence that people use only factual information previously”? There was a clear sense that embedded compensation causes advisor bias that came out of the Fair Dealing Model final report. In spite of this, the CSA only commissioned research that empirically demonstrated advisor bias recently- with two groundbreaking reports being released in 2015. My question to the CSA, therefore, is: “if you honestly wanted evidence of advisor bias, why did it wait you a decade to commission research to determine whether or not embedded compensation caused bias”? Dithering is not a course of action that can be reputably followed by anyone who purports to take purposeful action. If your house was burning, how long would you wait before you called the fire department? If your child was missing, how long would you wait until you called the police?

In spite of my obvious frustration, all will be forgiven if the people at the CSA can act purposefully rather than merely consult symbolically. The time has come to act. For the love of all that is decent in this world, please put an end to embedded compensation at the very first practical opportunity.

Sincerely,

John De Goey

Your consultation paper is thorough, lengthy and complex. Much thought and work obviously went into it and for this you should be commended. Most small investors though, do not even know about your deliberations. Real effort must be extended to actually reach out and hear the voice of the public.

Time after time these consultations are put forward and you are flooded with industry response. A few faithful investor advocates do their best to represent the voice of the public, and to whom small investors owe a great deal of gratitude. But you have a responsibility to engage the public in these important discussions and deliberations. In the future, may I suggest, you consider a different document and questionnaire that is geared to the general public and issued simultaneously. Most Canadians will not find themselves comfortable addressing such a large daunting document such as this one, but it is unfair to deliberate and make such important decisions without their voices being properly heard and given equal time and weight. Their voices must not continue to be drowned out by the industry, for they too have a stake in the game, often their life savings and future retirement!

It seems that whenever the industry doesn't like what the research and data demonstrate they just repeat that things are not clear.

"The Investment Funds Institute of Canada (IFIC) is calling on the Canadian Securities Administrators (CSA) to consider whether there's sufficient evidence of market failure to justify prohibiting embedded commissions and recommends that the CSA review other options."
http://www.investmentexecutive.com/-/ific-calls-on-the-csa-to-reconsider-potential-embedded-commissions-ban?utm_source=newsletter&utm_medium=nl&utm_content=investmentexecutive&utm_campaign=INT-EN-All-afternoon

"What is not at all clear is the extent to which Canada's dominant model of embedded compensation is harmful."
https://www.ific.ca/en/news/ific-ceo-responds-to-release-of-csa-consultation-paper-on-embedded-commissions/

I think Professor Cumming's research answers quite clearly that this compensation model *is* harmful to investors.

"In the buildup to the regulatory review of trailer fees in Canada, the mutual fund industry is trying to wage an ill-advised battle of misinformation. And one of the key tactics in this battle is to dispute facts and studies, including one I co-authored, ***that have proven beyond a doubt the detrimental effect of these fees.***
At the risk of making an analogy to the cigarette industry and early denial of the harm caused by cigarettes, ***I hope we stop blowing smoke and make use of the information and data provided by the mutual fund industry that clearly show trailer fees harm Canadian investors...***

"We appreciate that the industry has a substantial financial interest in keeping trailer fees in Canada, ***with over $5 billion per year charged to Canadian investors****. My co-authors and I have no financial stake one way or the other. We simply report what the data indicate."*
http://www.moneysense.ca/save/investing/blowing-smoke-on-trailer-fees/

If the research had gone the other way and shown that there was no harm to investors, the industry would have been sounding the trumpets and beating the drums over and over about that! But apparently the industry wants to shoot the messenger, since they have $5 billion per year at stake here.

I really like what Portfolio Manager, John De Goey says, "Making compensation transparent does not do anything to change pricing. Four quarters does not cost more than a dollar; not liking having to pay separately, does nothing to change the quantum of payment."
http://www.wealthprofessional.ca/news/a-portfolio-managers-view-on-the-ban-on-embedded-fees-223144.aspx

But I wonder in the financial industry, does it change the quantum of payment somehow? I can't help but feel they so desperately want to hang on to embedded commissions because they have ways of presenting it on reports that still keep things hidden and obscure from clients eyes. Since four quarters equals a dollar and since the client ultimately has to pay, lets just agree to make it plain, upfront with no blinders.

People should be informed. Informed consent should be a primary right for all clients. Why the CSA and provincial regulators allowed years for CRM2 to unfold and for fees to be hidden from clients sight is shameful. The industry fails to demonstrate why any client would be opposed to paying the same amount for advice and the same amount or less for investment products, once they actually truly understand. Why would transparent advice be less accessible to investors of any account size? It just doesn't make sense, except if they fear that when one sees what they are paying, they may not believe it is worth paying. Is there demonstrable value or not? People have a right to clearly know and decide for themselves.

Maureen Jensen in her speech at the Toronto Board of Trade in 2016 cited important research from the National Bureau of Economic Research. She said, *"research suggests **a combination of embedded fees and unsuitable portfolio construction has caused the investment returns of advised clients to lag passive market benchmarks by two to three per cent a year."The impact of these fees on investor returns is significant,"*** she said. ***"Investors experiencing this kind of outcome on a consistent basis would never break even and would, in fact, be worse off."***
http://business.financialpost.com/news/fpstreet/canadas-market-watchdogs-look-at-fundamentally-flawed-embedded-fees-on-investment-funds

With more and more employers no longer offering defined pensions, this research and its indicated outcome where investors lag benchmarks and may even be worse off, spells disaster for untold numbers of Canadians struggling to save for retirement.

Yet *"The industry is disappointed that the CSA has chosen not to consult on less disruptive alternatives and have limited the consultation to one option – a complete prohibition,"* said Bourque.

Less disruptive for whom? We are talking about Canadian citizens futures.

Maureen Jensen's comment addresses this *"The current compensation model consists of fees set by the fund manager **to incent sales. This does not put the investor's interest first, and that's a fundamental flaw that needs to be addressed."***
http://business.financialpost.com/news/fpstreet/canadas-market-watchdogs-look-at-fundamentally-flawed-embedded-fees-on-investment-funds

Deferred Sales Charge (DSC) sold funds are particularly harmful to clients.The 5% upfront payment to dealers and salesperson a.k.a. " advisors" appears to be irresistible to them despite the disadvantages to clients. The constraint on liquidity is not in an advised clients best interests. Note that DSC early redemption penalties cannot be offset against capital gains in registered accounts. Such irrecoverable penalties impair account returns for retirees and pensioners. It is especially egregious for this group whose health may change and access to their funds is crucial. I believe the CSA should act immediately to phase out the DSC option.

What about fee based accounts? There apparently are risks associated with fee-based accounts as well. One of the larger risks is reverse churning. In order for such a payment method to be acceptable,it must be in a clients best interest and be backed up by robust IIROC and MFDA enforcement ,which is sadly lacking at this point. I urge the CSA to make a renewed commitment to dramatically enhance, regulatory protective measures with a client first focus.

At the present time there is also approximately $18 billion in class A funds with discount brokers, paying trailer fees This shouldend and clients should be reimbursed those fees, since they have been charged for advice they did not even receive.

I continue to be concerned that the underlying structure is flawed and regulators are ignoring the real issue. This is no longer a transaction based sales industry, it is an advice based industry. Continually working from a wrong premise will not bring about the desired results for the industry or clients. If the foundation of a building is poor, it does not matter what you build on top of it, or how nicely you decorate the rooms in it. The foundation issue has to be dealt with first.

Ron Rhoades sums up quite nicely what is really needed when clients seek investment advice.

“We have fiduciary standards because disclosures are largely ineffective. A huge body of academic research supports this conclusion.
Say what you do. Do what you say. A fiduciary steps into the shoes of the client, and acts - with all of the expertise required of a professional adviser - with total loyalty to the client's interests.” Ron A. Rhoades
http://scholarfp.blogspot.ca/

Look at the evidence. The way forward is abundantly clear. Embedded commissions must go.

Canadians deserve advisers who acknowledge the high level of duty we are entrusting them with. Advice givers need to understand their role and have the requisite skill, training and supportive regulatory and industry culture going forward. Canadians need real professionals who are willing to embrace the true role of a fiduciary professional adviser.

It is time to do the right thing for average Canadians, who are depending on you to protect them.

I agree to the public posting of this letter.
Debra McFadden
Retail Investor

reasonably result in a reduction in the number of advisors offering financial advice. Some commentators might think this is a potentially positive likely outcome, while some stakeholders might see it as being a potentially negative outcome. What matters here is the outcome itself, not the terminology of how that outcome is to be positioned (whether the outcome is intended or not is largely and inherently a value-judgement). Stated differently, the same facts / consequences could be characterized differently depending on who is making the submission. Some might say that an outcome is positive (i.e. an "intended outcome"), while others might say (for example, decline in the number of advisors) is likely to be negative (i.e. an "unintended outcome"). My simple point is that the word "unintended" can be manipulated. It is often used as a synonym for words like "unfortunate" or "unpopular" when in actual fact, unintended consequences are simply those that people might not reasonably foresee.

By way of clarification, I believe the potential reduction in the number of advisors is both likely and positive. To me, it is neither here nor there whether that potential outcome was intended or not. It simply is. Furthermore, I believe it is an outcome that most reasonable people who understand the situation would reasonably foresee. As such, it would be disingenuous, in my opinion, to portray the consequence as "unintended". The term "unintended" implies that you didn't see the consequence coming – irrespective of whether that consequence is positive or negative. That's simply not the way many commentators use the term.

***

Please note that while I work as a portfolio manager at an IIROC member firm, I am nonetheless functioning as an independent contractor and the views expressed in this document are strictly my own. None of the comments that follow should be misconstrued as representing my place of employment. I will allow those people to speak for themselves just as I am speaking for myself.

For greater detail, I ask that the people reading this submission refer to my book The Professional Financial Advisor IV for more detail – especially chapters 4, 5 and 10 through 15. I provided copies of my book to both Dennis Yanchus and Chantal Mainville of the OSC in late 2016.

***

Rather than go into an inordinate amount of detail at the outset, I feel it would be best for me to answer the specific questions that are posed throughout the body of the consultation paper and to offer a summary and final overview once I have done so.

Therefore, my answers to your specific questions are as follows:

1. Yes. I feel the issues are essentially self-evident.
2. While not noted expressly in the introductory section, a key problem is the competitiveness of other products and investment alternatives. Stated differently, the opening section seems to deal with how embedded compensation can skew recommendations relative to competing products that pay lower commissions. However, there are a number of competing options (ETFs come to mind) which are often superior, cheaper, more transparent (regarding underlying holdings) and more tax effective (due to generally lower turnover) which are not expressly referenced at all. To my mind, the bigger problem is one of recommending the best products available; not merely the best products from among those that might pay an embedded

commission. My experience is that for many (mostly MFDA) advisors, the surest way to find your way off the product shelf is to have a product that does not offer embedded commissions. If one takes the view that mutual funds, in particular, are sold; not bought, then it should logically follow that registrants will likely prefer those products that are 'easy to sell'. In short, the 'other harms' that you ask about include foregone opportunities to substitute superior products into clients' portfolios in lieu of those that pay embedded commissions.

3. The short answer is 'no'. The longer answer is that concepts like 'access to advice' are red herrings. Changing how one pays for advice has zero economic impact on how much one pays.
4. The short answer is 'yes'. Normally, answering 'yes' would involve a non-response to corollaries a and b, however, I feel I need to respond at any rate. I have nothing to add re: a, but I do believe that, further to b, there is a real risk of regulatory arbitrage if embedded compensation is discontinued for some products and not others. Ironically, you have asked for empirically evidence in this paper. However, the nature of this question means that people will be required to offer their best guesses in light of the obvious lack of clear evidence regarding potential outcomes. I have heard a considerable amount of anecdotal evidence (some of which may have come to light after this discussion paper went to press) that many dual licensed registrants (both insurance and funds) were moving their practices toward segregated funds precisely because they did not want to be held to the standards set out in CRM II. If that trend is even modestly apparent due to CRM II, it would likely be highly apparent if embedded compensation was discontinued for mutual funds, but not segregated funds.
5. The simple answer is 'no'. This sort of policy would work best in a world where there is a level playing field and all participants (including discount brokerages) charged separately for the advice they give…. or are prohibited from charging in those instances where they expressly offer no advice whatsoever.
6. In my view, all manner of embedded compensation ought to be discontinued as per my previous response. There should be no exceptions. Embedded compensation should be discontinued across the board.
7. Yes, I agree. It simply maximizes transparency, minimizes bias and goes much further in exploding the (still prevalent after CRM II) myth that financial advice is "free".
8. Other compensations need not be under consideration for discontinuation at this time. As has been noted by the Brondesbury and Cumming Reports, embedded compensation compromises recommendations and creates an environment that can fairly be described as having advisor bias. Although I have personally not seen any research regarding advisor bias being caused (or even exacerbated) by the types of compensation noted in the original question, I do not believe it would be particularly material even if it did exist. Furthermore, some elements (small token gifts) will be difficult to monitor and might be open to interpretation if enforcement was attempted). If a limit is $100 and a company gives an advisor a golf shirt that cost $50 to manufacture, but that retails for $120, was the limit exceeded? Better to stick with the major concerns rather than getting involved in minutiae. The possible exception here is underwriting commissions. At present, some firms allow advisors to double dip – either by buying new issues directly into fee-based accounts or by buying them in commission-based accounts and then transferring them into fee-based alternatives. To my mind, the surest way to end this abusive practice – which is clearly contrary to the spirit of the regulations even if it is not always clearly contrary to the letter – would be to remove all embedded compensation from new issues.

9. In my opinion and further to the answers given to question #8 above, the answer is 'no'.
10. I have very limited experience regarding the questions asked in this section and, as such, I will refrain from commenting.
11. The idea of simplified payment remittances lies at the heart of making embedded compensation disappear, in my opinion. Too often, stakeholders come forward with the ridiculous positon that paying separately would cause clients to leave their advisors and create an "advice gap". This is total rubbish. Assuming all else to be equal, the amount being paid would be unchanged whether the payment is made via the payment of trailing commissions, the payment of direct and separately charged fees or the liquidation of pre-existing holdings to pay the fees. The quantum of payment does not change simply because the method of collection and remittance changes. The explanation that I like to use is that one dollar does not cost more than four quarters. The extent to which people refuse to pay for separate, transparent and duly itemized fees seems to be dependent on the extent to which they understand how and how much people pre-existing payment methods cost. Correlation is not causation. Certain groups would have people believe that charging separately makes advice less attainable. In fact, it simply makes the cost of advice more transparent. People refuses to pay not because they cannot do so (indeed, the cost of advice is unchanged), but because they are now being shown (in many instances for the first time) in a clear, unambiguous way just how much financial advice costs. The industry says it favours disclosure and transparency, but that is not strictly true. My experience is that certain stakeholders make disclosures only to the extent that they meet their (modest) regulatory obligations. In so doing, they are obviously not gaining an informed consent from their clients, because those same clients often refuse to pay when they are made to understand that financial advice is not "free". Facilitating payment (for instance, by redeeming units of mutual funds) would mean that those people who do not wish to pay separately could be accommodated seamlessly.
12. Categorically yes.
13. There needs to be a CRM III sort of disclosure that begins either prior to or concurrent with the ending of embedded compensation whereby consumers are told explicitly (in yearend dollar terms) how much their investment products cost. $100,000 in a front end equity fund with a 2.4% MER currently notes that compensation to the advisor and firm is (typically) $1,000 annually. It does NOT note that there is an additional $1,400 product cost being borne by the investor. In short, the quantum of product cost and the importance of product cost are not salient considerations for most retail investors. They ought to be. Making the information transparent is akin to making it salient. The entire challenge is to help investors make informed decisions. As such, the principle of informed consent needs to be championed and all means available to apply the concept should be utilized.
14. The answer to the conflicts of interest question depend on how the transition takes place. The devil is in the details, as they say. For instance, if an advisor could make more money using one format over another (if there is a period when both are at least somewhat available), one ought to expect the system that pays the advisor more to be the system that is recommended – all else being equal. Assuming all inherent conflicts can be eliminated (or at least honourably controlled for), I would not anticipate any problems.

15. In my opinion, the answers are/ outcomes will be as follows:
    - The will indeed be a greater alignment of services, products and overall advice.
    - The change will likely provide a moderate boost to the adoption of online services. The ramifications are likely too difficult to predict given the lack of statistically significant evidence on the subject. However, recent studies (Dalbar QAIB and the recent report from Morningstar Inc. of Chicago have found that mutual fund performance experienced by average Canadian fund investors is often worse than that of the funds they hold). As such, online and "robo" offerings may well gain increased acceptance as people come to understand the importance of managing both product and advisory costs and investor behavior as primary determinants of investment outcomes.
    - Discretionary is likely to increase as well. As a portfolio manager, I can tell you that my decision to offer discretionary series was driven by a different consideration – the desire to be held to a fiduciary standard. I made the decision to offer fee-based advice more than 15 years ago. Offering discretion is a logical extension of that earlier decision, which was nonetheless motivated by the principles set out in your paper: transparency, lower product cost and the breaking of the link between products recommended based primarily on preferred advisory business models.
    - Discount brokers are also likely to grow as a result of this change, but my suspicion is that the difference here will be relatively modest. The only real reason why people might switch to a discount broker as a result of the changes in 81-408 being enacted is that it might be cheaper to buy mutual funds by advoiding otherwise embedded trailing commissions. Anyone who is inclined to use a discount broker, but not mutual funds would likely be unaffected.
    - The cost of advice will be more granular as a result of unbundling. Specifically, small investors will likely end up paying moderately more for advice (but will likely be able to save a greater amount in lower product costs). Larger accounts (for instance, those over somewhere between \$500,000 and \$1,000,000) will likely pay the same or less for qualified advice. I would not expect a change in compensation methodology to lead to a material change in the services being offered. People generally do what they like and / or are comfortable doing – irrespective of how they are paid to do it.
16. In general, I would not expect broker/ dealers to offer different payments based on the segmentation of clients (for instance based on age, income, gender, profession, etc.). The primary means of segmentation will likely continue to be investable household assets, with a sliding scale being offered to offer competitive pricing for more desirable affluent households.
17. This proposal will absolutely, positively NOT result in an "advice gap". Changing how one pays does absolutely nothing to change how much one pays (*ceteris paribus*). A dollar does not cost more than four quarters. In particular:
    - Smaller investors are the ones least likely to pay – but only because they still do not (by and large –even after the reporting being done in CRM II) understand how and how much their advisor (and advisory firm) are being paid. Those who "refuse" to pay are largely oblivious to the **fact** that they have been paying for advice (often at similar or identical dollar amounts) all along.
    - I agree with the definition, but do not believe it will be manifested in the way that those who have expressed a concern about it would have people believe.

- There should be absolutely no distinction between face to face advice and 'robo' advice. This is especially true since there is no evidence (that I have seen, at any rate) that demonstrates the superiority of one format over another. Presumably, the distinction would be made on the premise that one kind (humans would always have the public believe they are better than pre-programmed algorithmic robots). Increasingly and in virtually all walks of life, artificial intelligence is disintermediating and disrupting pre-established business models. The onus is on those who claim the disruption is harmful to demonstrate that claim. To date, I have seen no such evidence.
- The things that would be most affected are mutual funds offered through discount brokerages and mutual funds offered to low-end (under $100,000 in household assets) families. Discount brokerages will be more compelling for DIY mutual fund investors. Many of the advisors serving small accounts insist that they add value through constructive behavior modification (i.e. encouraging higher savings rates). While possibly true, it might be equally true that 'robo' advisors are even more valuable (i.e. encourage the exact same behavior to the same extent, but at a lower cost). Again, I believe it is too early to say one way of another, but to suggest that the human approach is self-evidently superior is silly. Humans are the 'devil we know'. Presently, we simply do not know how effect 'robo' advisors might be in helping people to deal with their heuristic shortcomings. Time will tell.
- I do not believe the interplay between this initiatives or others will make for a material change (either better or worse) in the advice gap because I simply do not believe that there will be an advice gap.
- There is no need to mitigate things that do not exist. What are we doing to protect ourselves from a Martian attack?
- The short answer is 'no'. If anything, the expansion of online advice will serve to further democratize access to advice because the cost of advice with product implementation through 'robo' advisors will be the cheapest delivery mechanism available. Remember this: price is what you pay; value is what you get. In order to offer even comparable value, humans need to offer better advice, because the cost of 'robo' advice is lower than the cost of human advice. To my mind, 'robo' advisors represent an exciting and positive alternative for households with less than $100,000 in investable assets.
- I do not believe an advice gap will develop, but I fail to see how the concentration of advice offered by a particular channel (for instance, banks) would have an impact if it did develop.

18. Directionally, the industry would continue to transition toward unbundled formats at any rate. The issue here, however, is one of magnitude, not direction. Moving from 10% to 20% unbundled or from 20% to 25% is all fine and well, but if the pre-eminent problem is one of advisor bias, then that directional movement to (say) 25% unbundled would still leave 75% of the advisor population subject to bias-laden advice as a result of the harmful effects of embedded compensation. This matter is too important to leave to self-selection. Do police forces simply "encourage" people to refrain from drinking and driving without providing sanctions for those who fail to comply? Moral suasion is not nearly a powerful enough lever to cause such a necessary and fundamental shift to take place. Stronger measures are clearly in order.
19. Accepting that the depiction is necessarily general in nature, I believe the depiction set out in Figure 8 are reasonable. I would expect the industry to continue to evolve and migrate toward

higher end services and fees structures with algorithmic alternatives taking up the slack for the low end advisors and the clients they serve.

20. The only obstacles that exist are those that are implicitly imposed by dealers themselves. For instance, many vertically-integrated MFDA firms have been slow to offer true fee-based platforms. If they did, advisors might use them. But if advisors used them (i.e. substituted high-cost products for low-cost products in favour of their clients), it would hurt their employers. Employers call high-cost products "high-margin" products. To the extent that employers can delay the adoption of technologies and trading platforms that might be in their clients' best interests, they effectively maintain the status quo. Since most advisors at MFDA firms are more loyal to their employers (who defend their mutually-beneficial compensation models), only a modest number of would –be early adopters press for change. These people are quickly and easily marginalized as "troublemakers" when the prospect of real change is put on the agenda.
21. For purposes of this discussion:
    - I absolutely believe that industry consolidation will continue – and likely accelerate.
    - Consolidation is likely a positive development since it will leave only the largest, most well-capitalized firms standing. This, in turn, should provide greater stability and possibly even more compelling economies of scale for those people who would use these services (i.e. ordinary investors).
22. The challenges are likely to be as follows:
    - Independent dealers – operational and compliance-based in nature
    - Independent fund manufacturers – nothing but pain. They will lose market share and will have lower margins on the assets they retain
    - Integrated financial service providers – will likely fall somewhere between the two groups above depending primarily on whether they are more like the first group or the second
    - Mutual fund dealers – see Independent Fund Manufacturers
    - IIROC dealers – largely impervious. These firms have already gone through the necessary changes. They will sit back and watch the disruption that is about to hit the low (and perhaps even middle) segments of the market.
    - Online/discount brokers – will lose (most of) the cash cow of mutual fund trailing commissions, but otherwise be unaffected.

    - Regulatory arbitrage is likely to occur in the first few years. The extent to which it occurs depends primarily on relative timing. If there's a sense that there will be a long (say - 4+ year) lag between eliminating embedded in mutual funds and eliminating embedded in segregated funds, many near-retirement advisors (in particular) will simply make a modest change to their product mix in order to avoid having to make a more drastic change to their business model.
    - Dually-licensed registrants might be the most inclined to engage in product arbitrage. The major impact for them would be to have to re-paper their clients using insurance application forms. I have little insight to the other parts of this question.
23. I am unaware of any back-office limitations, but would caution you that some people (read: me) suspect that many firms opposed to this potential change will make excuses and suggest that technological and / or operational change will be too difficult to implement. The challenge, of course, is that claims of this sort are difficult to reliably confirm or refute (which, of course, is

precisely why they are made in the first place). The need for controls and oversight would simply change. Going forward, the need would be to ensure that clients were not being overcharged in some manner. At no point would any reputable person recommend not providing meaningful oversight with so much money at stake.

24. The short answer to your question is "of course". Once again, four quarters is neither less than nor more than one dollar. Changing how one pays ought to have no impact whatsoever on how much one pays. To the extent that it does (or to the extent that people allege that it does or that it has in the past), the reasons are pretty much entirely rooted in the parties not understanding how (and how much) they were paying in the first place. No rational person would be opposed paying the same amount in a different format.
25. Some ultra-progressive advisors (not entire firms) might move to a mixed model with a base retainer fee and an asset based fee on top. It guarantees a minimum annual income and often has specific (often annual) deliverables attached to the offering. This would likely round to zero as a percentage of the advisor population, however.
26. To my mind, the impact on representatives will be as follows:
    - career path – the industry will be more professional in the future. Much like young dentists entering the business, there would likely be an increased opportunity to buy a practice and to pay the retiring advisor out of the cash flow of that practice over a number of years
    - attractiveness of the job – massively positive. This is one of the very best career options available. It should do a better job than ever of attracting the best and the brightest.
    - typical profile of individuals attracted to the career – commensurate with a new doctor or accountant or engineer
    - recruitment – turning many good people away because there are only so many new spots / retiring advisors to go around
    - relative attractiveness of careers in competing financial service business lines – the top of the pyramid
27. My sense is that the mitigation measures being contemplated would do a good job of ensuring that access, choice and a level playing field are maintained for clients in all circumstances.
28. There are no other measures that I can think of that might help.
29. At the beginning of this document, prior to answering the specific questions, I made the point that "unintended consequences" is a bit of a loaded term since it's applicability depends primarily on what one's intent was in the first place. My example (again) is in regard to the population of advisors. I believe we have too many. As such, I believe that a reduction in the advisor population would be an extremely positive development for consumers – especially small consumers. As such, a reduction in the number of advisors would, to me, be both expected and intended. Most of all, it would be welcomed. Other stakeholders would likely point to a similar fact pattern and allege that these consequences would be a bad thing. In short, "unintended consequences" has become code for "bad thing". I simply disagree with this usage. The adjective is redundant and value-laden. These future outcomes should simply be called "consequences". The same goes for the word "choice". More choice is not necessarily better choice. Adding an inferior choice to a pre-existing menu that was entirely adequate is of not utility (and likely has a clear disutility) to those doing the choosing. With that out of the way, my view is that all consequences would be of the minor variety and could be dealt with relatively easily and purposefully.
30. My views are as follows:

a) Using a 1% trailing commission as a baseline, I will use my own fee schedule as a guide regarding the cross-subsidization of clients. My fees are 1.4% on the first $250,000; 0.8% on additional assets up to $1,500,000 and 0.5% on assets above $1,500,000. Accordingly, my fees are:

$250,000 – 1.4%; $500,000 – 1.1%; $750,000 – 1.0% (the point of indifference); $1,000,000 – 0.95%; $1,500,000 – 0.9%; $2,000,000 – 0.8%. Anyone who has an average client with less than $750,000 in investable assets would actually increase their revenue. This is also good news for the profitability of broker-dealers.

b) The short answer is "yes". Although my personal break-even point is $750,000, I also pass along product savings of about 1% relative to other market participants (MFDA registrants in particular). My experience is that clients with $500,000 to invest would gladly pay an advisor 10 bps more if that advisor had the decency to use product that cost the client 100 bps less. That's still a net saving of 90 bps ($4,500 annually on a $500,000 account) to the client family.

c) I'm unsure of what is being asked about eliminating a cross-subsidy. Nonetheless, I believe it might be useful to provide mandatory information to all clients with over $500,000 in mutual funds that they could realize substantial savings if they were to switch to a direct pay method and to using other products (e.g. ETFs and individual securities) as compared to their current product mix.

31. The industry could engage in a period of hyper-disclosure with a clear two page document given to all clients with embedded compensation that offers a clear, concise explanation of the change that can be easily understood (and not manipulated by unscrupulous people who continue to insist that advice is - and always was - free). This could be similar to the Client Relationship Disclosure documentation that became mandatory after the introduction of CRM I. Written client disclosure verifying that the documentation has been received would ensure that facts could not be misrepresented.
32. Transition options depend very much on the individual practice. It would be extremely difficult, in my opinion, for anyone to offer general advice on the topic of transitions, since various advisors will be at varying stages of readiness and so their clients will have different (both in identity and in magnitude) challenges in adjusting to the new order. Flexibility is paramount. My view is that an appropriate transition period would involve a clear deadline set out in 2017 with clear intermediate steps along the way. For instance, it could be announced that embedded compensation would end on December 31, 2020. It could be further announced that until that date, all funds sold with a back end load would need to have their penalty period expire on or before that date. A fund sold in 2018 might only have a 2-year DSC penalty and a fund sold in 2019 might only have a one year penalty. Funds sold in 2020 might carry a trailing commission, but would no longer be able to have a DSC of any kind. Finally, if technology allows the industry to reliably identify funds with embedded compensation (i.e. via discreet fund codes), then there could be a period where embedded funds and unbundled funds co-existed in client accounts, provided that there was a reliable way to avoid double-dipping (i.e. to ensure that only F Class funds attracted an advisory fee).
33. My dream would be to have all embedded compensation gone from Canada as we begin 2021. It is, to me, the first reasonable opportunity to do away with embedded commissions.
34. No caps should be placed on embedded commissions other than the elimination timeframes I noted above.
35. I believe the steps under consideration are sufficient.
36. There are no other alternatives that I can think of.

Thank you for your time and consideration. The exercise is a useful one and I'm sure you will be receiving a number of thoughtful responses to this important matter. Even though I strongly support the general thrust of this paper, I cannot help but wonder why it has taken so long for us to come this far. I was involved in the Fair Dealing Model Consultations over a decade ago.

Given my tenure on this file, you might imagine that there are some things that I find disheartening about the exercise. The consultation paper asks that commenters not re-hash previously-made arguments, but rather answer the pointed questions that the paper asks using demonstrable facts. The question that this begs is: “where was the insistence that people use only factual information previously”? There was a clear sense that embedded compensation causes advisor bias that came out of the Fair Dealing Model final report. In spite of this, the CSA only commissioned research that empirically demonstrated advisor bias recently- with two groundbreaking reports being released in 2015. My question to the CSA, therefore, is: “if you honestly wanted evidence of advisor bias, why did it wait you a decade to commission research to determine whether or not embedded compensation caused bias”? Dithering is not a course of action that can be reputably followed by anyone who purports to take purposeful action. If your house was burning, how long would you wait before you called the fire department? If your child was missing, how long would you wait until you called the police?

In spite of my obvious frustration, all will be forgiven if the people at the CSA can act purposefully rather than merely consult symbolically. The time has come to act. For the love of all that is decent in this world, please put an end to embedded compensation at the very first practical opportunity.

Sincerely,

John De Goey

CSA Consultation 81-408 on the

Option of Discontinuing Embedded Commissions

the co-operators

A Better Place For You®

Introduction

On behalf of The Co-operators Group Ltd. ("The Co-operators"), we are pleased to provide comments on the CSA's Consultation Paper 81-408: *Consultation on the Option of Discontinuing Embedded Commissions,* which seeks input on the option of discontinuing embedded commissions and the potential impacts of such a change on Canadian investors and market participants.

About The Co-operators

The Co-operators Group Limited ("The Co-operators") is owned and governed by 44 co-operatives and credit union centrals across the country. As one of Canada's most prominent financial services organizations we are proud to provide insurance and financial services to more than two million Canadians. We are even prouder that we provide financial security to Canadians in their communities while staying true to our co-operative values.

We have over $44.9 billion in assets under administration, employ 4,992 individuals and count 500 exclusive financial advisors in our network, while serving more than 350 credit unions with more than 5.5 million members. We provide coverage to 38,000 farms and 295,000 businesses and insure approximately 805,000 homes, 1.3 million vehicles and protect 629,000 lives.

As a co-operative, concern for the community is one of our founding principles. That is why, in 2016 alone, The Co-operators contributed over $7.5 million, which represents 4.1% of our pre-tax profit, to Canadian charities and community organizations across the country.

4,992 EMPLOYEES - 500+ ADVISORS

38,000 FARMS - 295,000 BUSINESS

805,000 HOMES - 1.3M VEHICLES - 629,000 LIVES

Financial security for Canadians and their communities is our core mission. Our customer base is primarily comprised of "mass market" investors. The insurance and financial products and services provided by The Co-operators are delivered primarily through our independently contracted, but exclusive, face-to-face advisor channel. All of our advisors sell (registered and non-registered) segregated funds, as well as TSFAs and RESPs. Through Credential Financial Inc., a member of our group of companies, some advisors also distribute mutual funds. We expect to expand this offering to all of our advisors in the future.

The CSA's paper identifies a number of important areas in which there are opportunities to significantly enhance outcomes for consumers which include conflicts of interest, limited investor awareness, and misalignment of fees with services received. We agree that consumers are best served when transactions are transparent, conflicts of interest are disclosed or eliminated, when consumers have the tools to understand the information provided to them, and when fees align with services provided.

It is our view that these shared goals are best addressed through increased choice and transparency. While we do not oppose the removal of embedded commissions, we do share the industry's concerns around unintended impacts on accessibility and affordability of financial advice for Canadians. We believe an environment with embedded commissions with clear disclosure would provide Canadians with the best option in terms of affordability and choice.

Investor Protection and Market Efficiency Issues

The CSA outlines three key investor protection and market efficiency issues raised by mutual fund fees. We agree that embedded commissions could present a conflict of interest that misalign the interests of investment fund managers, dealers and representatives with those of the investors. However, we believe this a disclosure, not a market issue. Emphasis should lie on helping advisors focus on finding good performing portfolios for low Management Expense Ratios. At The Co-operators, we achieve this goal by providing a well-rounded suite of segregated fund products and transparent fee disclosure. Some of our agencies also engage in third party mutual fund sales through Credential Asset Management (dealer) with the same commitment to fee transparency. We acknowledge, however, that this may differ in the mutual fund industry.

Regulatory Impact

Our foremost concern is that the discontinuance of embedded commissions could result in an "advice gap" in terms of face-to-face counsel. Mass and mid-market investors may be left with only self-service style information with limited capacity to take advantage of this guidance.

Financial literacy is a considerable challenge in Canada and this move would likely further compound the problem of all Canadians having access to financial advice. Based on our business model, we strongly believe that face-to-face advice leads to the uncovering of other needs, goals, objectives, risks and concerns that clients are unaware of and ultimately, to a discussion of how to close to those gaps.

The fund industry has pointed to the consequences of relevant regulatory reforms in other jurisdictions (such as the U.K. and Australia) as potential evidence of the likely impact of the discontinuation of embedded commissions in Canada. We understand it is the CSA's position that while the impacts of relevant reforms in other jurisdictions are informative and insightful, potential impacts from similar reforms in Canada might not be the same.

We do, however, remain concerned that the mass and middle-market will be underserved by a discontinuation of embedded commissions. The loss of embedded commissions will only serve to increase entry level costs for advice to the mass and middle markets. In the U.K., this change has also resulted in a reduction of the number of advisors in the business – with an estimated 11,000 advisors leaving the industry since 2008 according to the U.K.'s Institute of Financial Accounts. Those that remained focused on high-net clients.[1]

In addition, more restrictive educational standards further drove out advisors from the market. We do recognize and acknowledge that continuing education is absolutely critical to those working in the wealth and investment marketplace and it should be a mandatory requirement in all provincial jurisdictions both within the securities industry and the insurance industry.

The prospect of regulatory arbitrage across distribution channels, as well as products, to create an uneven playing field is another consideration. Unless all manufacturers and distributors move in the same direction for a level playing field, we worry a commission ban may unintentionally favour large banks. Banks have salaried staff and performance-based bonuses based on sales volumes, not per transaction, which can be a very significant portion of their income. As such, their mutual fund disclosure statements would not show a trailing commission as bonuses.

With respect to segregated funds in particular, the paper notes the similarity between segregated funds and other investment fund products – including the use of embedded commissions – and calls for a harmonized approach to regulating such products.

We agree that requirements for segregated and mutual funds should be such that consumers can easily compare products. As members of the Canadian Life and Health Insurance Association, we share their position with respect to the implementation timelines.

We are pleased that the CSA will coordinate with the Canadian Council of Insurance Regulators (CCIR) to address the potential for regulatory arbitrage between investment funds and segregated funds.

Mitigation Measures

We have expressed our concerns regarding the affordability of advice to those in the mass or middle market if they are forced to pay "upfront" fees. In fact, a recent survey suggests that almost a quarter of respondents would be less likely to use an advisor if charged directly for advice.[2] Canadians deserve choices. Clients should have the option of either paying the fee upfront or having the fee withdrawn from their account on a "no-load" flat fee basis – transparency is the key.

Other Regulatory Initiatives

In terms of disclosure, while the Client Relationship Model Phase 2 (CRM2) initiative is a step in the right direction, more needs to be done. We are aware that other industry stakeholders have urged to allow full implementation to assess its results but we believe disclosure around fees paid to manufacturers could be stronger. Statements must show both the percentage and dollar amount for the management, dealer/MGA and advisor fees - and in the case of segregated funds, the insurance fee as well.

Conclusion

Thank you for the opportunity to provide our comments on the CSA's Consultation Paper 81-408: *Consultation on the Option of Discontinuing Embedded Commissions.* We hope the consultation will result in a strengthened market, one where clients can take advantage of offerings through a payment schedule that they understand, have choice over, and can afford. We also believe informed choice will encourage better servicing of clients on an ongoing basis.

Please do not hesitate to contact our Director of Government Relations, Maya Milardovic, at 519-824-4400 or maya_milardovic@cooperators.ca should you have any questions or wish to arrange a follow-up meeting.

With best regards,

MICA
CAPITAL
CABINET DE SERVICES FINANCIERS

PAR COURRIEL
Consultation-en-cours@lautorite.qc.ca

Québec, ce 8 juin 2017

Me Anne-Marie Beaudoin
Secrétaire générale
Autorité des marchés financiers
800, rue du Square-Victoria, 22e étage
C.P. 246, tour de la Bourse
Montréal (Québec) H4Z 1G3
Consultation-en-cours@lautorite.qc.ca

OBJET : Document de consultation 81-408 des ACVM – Consultation sur l'option d'abandonner les commissions intégrées.

Me Beaudoin,

Il nous fait plaisir de vous transmettre nos commentaires en lien avec la consultation mentionnée en exergue.

Préambule

MICA Capital Inc. est un cabinet de services financiers inscrit auprès de l'Autorité des marchés financiers au Québec à titre, entre autre, de courtier en épargne collective et en marché dispensé. Environ 180 représentants y sont rattachés et œuvrent sur tout le territoire québécois. Cette entreprise est la propriété d'intérêts privés et n'est donc pas la propriété d'une compagnie d'assurances ni d'une institution financière. Elle existe depuis maintenant plus de 30 ans.

MICA Capital Inc. permet de distribuer, par l'entremise de ses représentants, les fonds mutuels de plus de 60 sociétés de fonds d'investissement différentes ainsi que les produits du marché dispensé d'une dizaine d'émetteurs. Nous n'émettons aucun produit et ne distribuons donc aucun produit « maison ». Par ailleurs, MICA n'est pas membre de l'ACFM (MFDA).

Nous sommes particulièrement interpellés par le sujet soulevé par votre document de consultation relatif à l'option d'abandonner les commissions intégrées.

Nous avons d'ailleurs lu avec grand intérêt le contenu du document de consultation publié le 10 janvier 2017.

Nous tenons à vous remercier de nous donner l'opportunité de faire valoir notre position, nos arguments ainsi que nos pistes de solutions envisageables. La volonté manifestée d'obtenir les commentaires des intervenants de l'industrie démontre un souci d'être à l'écoute des principaux intéressés et nous l'apprécions.

Introduction et mise en contexte du présent mémoire

Nous avons choisi de ne pas répondre à chacune des questions soumises telles que présentées dans le document de consultation. Nous préférons cerner les enjeux au cœur de cette réforme proposée et nous attarder aux conséquences négatives d'une éventuelle abolition des commissions intégrées. Par le présent document, nous souhaitons mettre en lumière des solutions que nous proposerons qui, si elles étaient appliquées, répondraient mieux aux impératifs de transparence, d'efficience des marchés et aux intérêts des consommateurs.

Nous sommes d'opinion que l'abolition des commissions intégrées soulève des enjeux de société fondamentaux et prétendons que les organismes réglementaires, avant d'aller de l'avant vers une telle abolition, se doivent de bien mesurer les impacts possibles futurs sur notre société au sens large. Outre le fait que les organismes réglementaires ont comme principales missions de veiller à la protection des consommateurs et de s'assurer de l'efficience des marchés financiers, elles ne doivent pas faire abstraction de leur rôle social et des impacts que leurs décisions peuvent avoir sur notre société, à court, moyen ou long terme.

D'emblée, nous affirmons ceci :

- Le focus de la présente consultation porte sur l'abolition des commissions intégrées. À notre avis, l'emphase devrait plutôt être mis sur le fait que les consommateurs devraient connaitre tous les frais qu'ils assument, y compris les frais des gestionnaires de fonds, et non pas seulement les commissions qu'ils payent. La transparence est de mise et nous sommes d'avis que les consommateurs doivent connaitre entièrement tous les frais qu'ils assument, peu importe le mode de rémunération qu'ils choisiront. Ils ont droit à une pleine divulgation des frais payés au moment opportun. Nous pourrions ainsi parler d'une véritable transparence!
- Les consommateurs doivent recevoir des conseils et des services qui correspondent à leurs attentes et leurs besoins;

- Les consommateurs doivent pouvoir se voir offrir un ensemble de modes de rémunérations parmi lesquels ils pourront faire un choix en tenant compte de leurs besoins et de leur situation particulière;
- Tous les consommateurs doivent avoir accès à une offre élargie et pouvoir choisir vers qui se tourner et ainsi, avoir accès à plusieurs réseaux de distribution;
- Le mode de rémunération impliquant des commissions intégrées n'est peut-être pas parfait mais il est perfectible. D'ailleurs, nous croyons pouvoir affirmer qu'aucun mode de rémunération n'est parfait. Nous proposerons des pistes de solutions à cet égard.

Nous vous exposerons, dans les prochaines pages, nos prétentions et nos craintes face aux conséquences fâcheuses que pourrait entrainer l'abolition des commissions intégrées. Nous mettrons aussi en évidence certains impacts que nous envisageons tant pour les consommateurs et l'industrie que pour la société de demain.

Mieux informer les consommateurs

Nous sommes d'avis que la transparence est de mise à l'égard des consommateurs en ce qui concerne la divulgation des divers modes de rémunération du conseiller.

La venue de l'aperçu du fonds a contribué à une meilleure divulgation. Ce document contribue à mieux communiquer aux consommateurs des informations plus claires à propos, entre autre, de la rémunération. Il est probablement trop tôt pour mesurer avec précision les bienfaits de cette nouvelle façon de faire. Nous croyons qu'il serait toutefois pertinent et utile d'attendre quelques temps pour prendre conscience de la pleine mesure des bienfaits de l'utilisation d'un tel document sur l'éducation et la compréhension des consommateurs à l'égard de la rémunération.

Peut-être pourrions-nous envisager de bonifier l'information apparaissant à cet aperçu du fonds? Peut-être pourrions-nous envisager la possibilité d'obliger les conseillers à inscrire sur les documents de souscription à un fonds le montant de commissions payées lors de la souscription et un estimé des commissions de suivi qui seront versées?

Nous proposons par ailleurs que les montants de commissions versées au moment d'une transaction d'achat d'unités de fonds (frais de rachat reporté) soient indiqués, en dollars, sur l'avis d'exécution transmis au client dans les jours qui suivent une transaction. Sur ce même avis d'exécution, il pourrait y avoir une mention qu'une commission de suivi de x% sera versée au courtier. Sur réception de son avis d'exécution, et s'il n'est pas d'accord avec ce mode de rémunération, le consommateur devrait pouvoir demander l'annulation de la transaction dans un délai donné et ce, sans aucun frais ni pénalité.

Aussi, depuis peu, les consommateurs doivent recevoir un rapport annuel faisant état de la rémunération versée au courtier au cours d'une année. À notre avis, cette information transmise aux consommateurs est trompeuse dans sa forme actuelle. Cette information n'est pas représentative de tous les frais que les consommateurs assument. Si les ACVM veulent la pleine transparence, elles n'ont d'autres choix que d'exiger que les consommateurs soient informés de tous les frais qu'ils payent. Ceci implique qu'ils devraient aussi voir apparaitre sur leur rapport annuel sur la rémunération les frais de gestion perçus par les gestionnaires de fonds. De cette façon, les consommateurs sauraient les coûts réels exacts liés à leurs placements. Nous préconisons donc une pleine et totale divulgation des frais assumés par les consommateurs. Ainsi, il y aurait une véritable transparence.

Commissions intégrées si aucun conseil

Nous sommes d'opinion que les réseaux de distribution ayant un modèle de distribution sans conseiller (par exemple, le courtage à escompte) ne devraient pas être autorisés à proposer des fonds à commissions intégrées. N'offrant aucun conseil ni suivi, il est inconcevable que ces réseaux perçoivent des commissions de suivi. D'autre part, ces réseaux font souvent partie d'un groupe intégré où nous retrouvons, à la fois, les distributeurs et les gestionnaires de fonds. Ainsi, les seuls frais que les consommateurs devraient devoir payer sont les frais de gestion des gestionnaires de fonds pour leur travail effectué.

Fausse prétention que les consommateurs pourront mieux négocier les honoraires

Quant au contrôle des coûts, avec respect pour l'opinion contraire, il serait illusoire de croire que la formule à honoraires permettra un meilleur contrôle de la rémunération que paiera le consommateur. On semble prétendre que cette formule permettra aux consommateurs de négocier la rémunération du conseiller. À notre avis, rien n'est moins certain. Ce qui risque plutôt d'arriver, c'est que les conseillers et les courtiers établiront des barèmes établissant une rémunération standardisée qui tiendra compte de la valeur de l'actif de chaque consommateur. Et ces barèmes seront appliqués de façon uniforme. Nous doutons que le consommateur ait un véritable pouvoir de négociation à cet égard. Les conseillers et les courtiers administrent des entreprises et doivent s'assurer de la rentabilité de celles-ci. Ainsi, leur tarification devra tenir compte de leurs « coûts de revient » afin de s'assurer d'une certaine rentabilité. Donc, il serait pour le moins étonnant que les consommateurs puissent négocier de façon importante car il y aura toujours un seuil que le conseiller ou le courtier ne voudra pas dépasser.

Tout comme il est difficile, voire impossible, de négocier les taux horaires d'un avocat ou d'un comptable, nous croyons qu'il est imprudent de penser que ce le sera plus pour les conseillers et les courtiers.

Les consommateurs seront-ils prêts à payer des honoraires?

Plusieurs études démontrent qu'une bonne partie des consommateurs préfère payer des commissions intégrées plutôt que d'avoir à payer des honoraires pour les services de leur conseiller. D'ailleurs, diverses sondages ou études sérieuses parus dans les médias tout récemment tendent, une fois de plus, à le démontrer. Donc, advenant l'abolition des commissions intégrées, nous devons nous demander ce qu'il adviendra de ces consommateurs à qui les commissions intégrées conviennent. N'ayant plus cette possibilité d'opter pour des commissions intégrées, seront-ils prêts à payer des honoraires à leur conseiller? Nous en doutons profondément.

Les produits financiers tels les fonds d'investissement ne sont pas des biens de consommation courante. Ces produits sont intangibles. Nous pensons qu'il ne soit pas concret ni naturel pour les plus petits épargnants d'opter pour un mode de rémunération à honoraires. Devant l'abolition des commissions intégrées, nous craignons que ces consommateurs doivent se tourner vers des solutions « sans conseil » alors que ce sont eux, les plus petits investisseurs, qui ont le plus besoin de conseils et d'éducation.

Le conseil financier est un « bien de confiance ». Il diffère fondamentalement des biens et services à la consommation, parce que:

- les avantages sont abstraits et retardés dans le temps;
- la majorité des consommateurs est incapable d'évaluer avec confiance la qualité des conseils et du caractère raisonnable du coût des services qu'elle reçoive, même après des achats répétés;
- comment un investisseur peut-il distinguer entre « décider de ne rien faire » et « avoir omis de faire quelque chose » ?

Face à cette issue incertaine, nous sommes d'avis qu'une grande proportion d'individus s'abstiendra de s'adjoindre un conseiller financier s'ils sont tenus de payer à l'avance pour un service dont ils ne parviennent pas à saisir la valeur intrinsèque.

Le libre choix des consommateurs quant aux modes de rémunération

Nous ne croyons pas que de restreindre les choix des modes de rémunération, actuellement disponibles aux consommateurs, soit dans l'intérêt de ceux-ci.

Au lieu de mettre la hache dans un mode de rémunération (commissions intégrées) qui ne semble pas être parfait, pourquoi ne pas essayer de plutôt le bonifier. À tout le moins, faisons l'effort d'essayer et voyons comment nous pouvons rendre ce mode de rémunération plus transparent pour le consommateur.

Nous croyons que les consommateurs devraient pouvoir choisir de quelle façon ils souhaitent rémunérer leur conseiller. Par contre, pour pouvoir le faire, ils devront avoir accès à un maximum d'informations leur permettant de prendre une décision libre et éclairée en temps opportun.

En tout respect, nous comprenons mal comment les ACVM pourraient décider, de leur propre chef, d'imposer leur choix aux consommateurs quant aux modes de rémunération à choisir. En ce faisant, les ACVM décident en lieu et place du consommateur en lui retirant la possibilité de choisir un mode de rémunération avec commissions intégrées qui pourrait leur convenir. En se positionnant ainsi, les ACVM décident pour tout le monde, dictent les modes de rémunérations qu'elles imposent et décident que « one size fits all ». Il nous semble un peu présomptueux pour les ACVM de penser détenir LA vérité à cet égards.

Encadrons de façon plus approfondie l'option des commissions intégrées et laissons le choix final aux consommateurs!

Perte de transparence au détriment des consommateurs

Les décisions d'investissement sont une question de choix entre différentes options, ce qui implique que les investisseurs doivent être en mesure de comparer la qualité et le coût des services financiers entre les diverses entreprises offrant ces types de produits et services.

Lorsque le coût des conseils financiers est dissocié de celui des produits financiers, la comparaison du coût total entre différents intermédiaires financiers est rendue inaccessible aux investisseurs individuels parce que les entreprises ont pour politique de ne pas divulguer publiquement les charges réelles imposées à leurs clients.

Une saine réglementation doit poursuivre deux objectifs de transparence distincts mais complémentaires:

– La protection des consommateurs par la divulgation complète et en temps opportun aux clients individuels des coûts encourus et des rendements du portefeuille;
– Favoriser la concurrence et l'efficience du marché par la promotion de la transparence des prix à l'échelle de l'industrie.

Actuellement, selon la formule de commissions intégrées, deux investisseurs détenant les mêmes fonds paient exactement les mêmes frais. D'ailleurs, ces frais apparaissent dans le prospectus et dans l'aperçu des fonds. Cette information est publique et accessible à tous. Par contre, selon la formule de rémunération à honoraires, il est tout à fait possible et prévisible que ces deux mêmes investisseurs paient des honoraires différents l'un de l'autre. En effet, un représentant pourrait établir des honoraires de 1% et un autre représentant, demander 1.25%.

Donc, en visant la transparence, les organismes de réglementation risquent d'amener une plus grande opacité et une plus grande iniquité dans les frais chargés aux consommateurs en souhaitant abolir l'option des commissions intégrées.

Restrictions quant à l'offre de services disponibles (accès aux conseils) et concentration

Nous croyons qu'en imposant un mode de rémunération à honoraires à tous les consommateurs, sans aucune distinction, ceci aura pour effet de restreindre l'offre de services disponibles à plusieurs de ceux-ci, plus particulièrement pour les plus petits investisseurs. Nous sommes aussi d'avis que d'agir ainsi amènera une concentration. Puisque les courtiers imposeront des comptes d'une valeur nominale, ceci fera en sorte que les plus petits investisseurs seront probablement délaissés et leur seule option restante sera d'opter pour un modèle « sans conseil », ce qui amènera une concentration auprès d'institutions offrant ce type de comptes. Cette concentration est-elle vraiment dans l'intérêt du consommateur? Il est légitime de se poser cette question.

Une telle façon de faire favorisera probablement les institutions financières qui sont à la fois, manufacturières et distributrices de produits financiers. Cette concentration dans des structures intégrées pourrait amener les consommateurs à se voir proposer des produits avec un potentiel de rendement inférieur. Ces institutions financières intégrées, nous le savons tous, ont souvent tendance à privilégier et offrir les dépôts bancaires plutôt que d'autres solutions ayant un potentiel de rendement plus élevé. Si tous ces consommateurs sont amenés à investir dans des CPG par exemple, ceci aura un effet important sur leurs rendements et amènera, par effet direct, une diminution d'accumulation d'actifs en vue de leur retraite.

La concentration des plus petits investisseurs vers les institutions financières intégrées est-elle vraiment souhaitable pour le consommateur et l'industrie? Nous ne le pensons pas. Une industrie concentrée peut devenir une industrie qui offre moins de choix de placements. À la limite, la concentration peut amener certaines institutions à moins bien servir leurs clients et à rendre les clients plus dépendants de leurs services étant donné le manque d'autres options de fournisseurs disponibles.

Nous rappelons aux lecteurs que l'article 8 de la Loi sur l'Autorité des marchés financiers prévoit ceci :

« 8. *L'Autorité exerce ses fonctions et pouvoirs de manière:*

(…)

> *2° à* ***promouvoir une offre*** *de produits et services financiers de haute qualité et à un prix concurrentiel pour l'****ensemble*** *des personnes et des entreprises dans toutes les régions du Québec;*
>
> *3° à assurer la mise en place d'un cadre réglementaire* ***efficace*** *favorisant le développement du secteur financier et permettant l'évolution des pratiques de gestion et des pratiques commerciales dans ce secteur; »*

(nos soulignés)

Concentration et consolidations à prévoir

Parmi les conséquences non souhaitables, les phénomènes suivants pourraient se produire :

- Une concentration des plus petits investisseurs dans les institutions financières intégrées;
- Un mouvement de consolidation massif de certains courtiers qui décideraient d'être engloutis par un compétiteur.

Ces deux phénomènes, selon nous, créeraient une diminution de l'offre pour le consommateur ainsi qu'une baisse de compétitivité, ce qui en soit est rarement bon pour les consommateurs concernés.

Gestion des conflits d'intérêts

Il est louable que les organismes réglementaires veillent à une saine gestion des conflits d'intérêts entre les fournisseurs de produits et services financiers et le consommateur.

Toutefois, nous croyons que, au lieu de mettre d'abord l'emphase sur les conflits d'intérêts potentiels liés au mode de rémunération selon des commissions intégrées, il serait plus à propos et urgent qu'ils s'attaquent aux sources suivantes de conflits d'intérêts :

- Les fournisseurs de produits financiers limités à leurs propres produits exclusifs lesquels sont assortis de bonifications en faveur de leurs employés qui le vendent. (Ex : conseiller salarié qui doit vendre le produit que son employeur l'oblige à vendre)
- L'instauration de cibles de vente, les promotions et l'évaluation du volume d'affaires à des fins de primes ou bonifications versées à des conseillers salariés;
- Le fait que certaines institutions financières offrent d'emblée aux consommateurs des produits de dépôt à faible rendement, ce qui leur permet d'obtenir des sommes pour ensuite prêter ces mêmes sommes à d'autres consommateurs;
- Uniformiser les commissions de suivi intégrées. Pour réduire les risques de conflits d'intérêts, les régulateurs pourraient encadrer les rémunérations versées par les manufacturiers de fonds aux courtiers et aux conseillers. La commission de suivi pourrait être identique, quel que soit le produit financier distribué;
- Obliger les sociétés de fonds à mettre en place des mécanismes de réductions tarifaires automatiques tenant compte des sommes investies. Nous précisons ici que quelques sociétés de fonds d'investissement ont déjà mis en place ce mécanisme.

La technologie comme solution alternative pour les consommateurs délaissés

Nous croyons qu'il est déraisonnable de penser que la technologie sera la solution alternative pour les consommateurs qui n'auront plus accès à des conseils advenant l'abolition des commissions intégrées.

Nous pensons qu'une très faible proportion de ces consommateurs se tournera vers de telles technologies. La très grande majorité de ceux-ci aura plutôt tendances à se tourner vers des institutions financières intégrées, qui sont à la fois manufacturière et distributrice de produits financiers. Ceci amènera donc une concentration plus élevée auprès de ces institutions financières, lesquelles n'offrent souvent que des produits exclusifs, proposent souvent des produits de type « dépôts » qui offrent un faible potentiel de rendement et qui, pour certaines, offrent très peu de conseils et de suivis à leurs clients.

De façon générale, les consommateurs démontrent peu ou pas d'intérêts vers des solutions sans conseil. Nous prenons pour exemple le modèle d'affaires des courtiers à escompte. Bien qu'implanté depuis plusieurs années, ce modèle d'affaires n'a réussi à rallier qu'un très petit nombre de consommateurs lorsque comparé à l'industrie des services financiers en général.

Hausse des frais d'opérations et conséquences

Nous sommes d'opinion que l'abolition des commissions intégrées pourrait amener une hausse des coûts des frais d'opérations des courtiers. En effet, si les courtiers doivent prendre en charge la mise en place de mécanismes de facturation et de perception d'honoraires, ils devront assumer des coûts importants d'implantations et de maintien. Les systèmes informatiques devront être mis à niveau ou développés pour permettre la mise en place d'un tel système. Des ressources humaines devront être consacrées à cette mise en place et au maintien du système par la suite. Tout ceci amènera inévitablement des coûts à assumer par ces entreprises.

Afin d'assurer leur pérennité, les courtiers doivent veiller à ce que chaque compte soit rentable. Si leurs coûts d'opérations augmentent, ils n'auront d'autres choix que d'imposer des tailles de comptes minimums et de charger, parfois, des frais plus élevés pour les plus petits comptes afin de maintenir une certaine rentabilité pour leur entreprise.

Si cela se produit, les organismes de réglementation auront-ils atteint leur objectif de veiller aux intérêts des consommateurs?

L'abolition éventuelle des commissions intégrées ne contribuera pas à faire diminuer les frais payés par les consommateurs, bien au contraire.

Commentaires quant aux 3 enjeux soulevés à la partie 2 du document de consultation

Enjeu 1 : Les commissions intégrées donnent lieu à des conflit d'intérêts qui entrainent un décalage entre les intérêts des gestionnaires de fonds d'investissement, des courtiers et des représentants et ceux des investisseurs.

Nos prétentions : Tout d'abord, nous déplorons le fait que cette prémisse des ACVM se fonde sur des études ou des rapports datant de plusieurs années, allant aussi loin que 1995. Il existe de nombreuses autres études sérieuses beaucoup plus récentes dont il aurait fallu tenir compte, par exemple celles préparées par CIRANO. (The value of financial advice, Claude Montmarquette et Nathalie Viennot-Briot, CIRANO, 2016)

Nous sommes en désaccord avec l'affirmation suivante contenue à la page 10 du document de consultation :

« …la structure des commissions intégrées peut encourager les gestionnaires de fonds d'investissement à considérer les courtiers et les représentants, plutôt que les personnes qui investissent dans leurs fonds, comme leur « clients »

Les fonds d'investissement et les conseillers sont des partenaires qui ont un objectif commun : bien servir le consommateur et lui offrir le meilleur rendement possible tenant compte de sa tolérance au risque et de sa situation financière. Ils savent très bien que, si les frais à payer ou les rendements ne sont pas concurrentiels, ils risquent de perdent le consommateur. Ils ont tout intérêt à demeurer compétitifs.

Quant à la possible partialité des recommandations faites par les conseillers qui pourrait amener le conseiller à recommander une société de fonds plutôt qu'une autre dans le seul but de bonifier sa rémunération, les ACVM devraient savoir que depuis un certain temps déjà, il se dégage une certaine uniformité dans la rémunération offerte par les diverses sociétés de fonds. Bien qu'autrefois, de telles disparités fussent fréquentes, ce phénomène est pratiquement disparu à l'heure actuelle. À l'occasion, il peut y avoir de très minimes écarts mais sans plus.

Enjeu 2 : L'intégration des commissions limite la connaissance, la compréhension et le contrôle des coûts de la rémunération des courtiers et des investisseurs.

Nos prétentions : Quant à la connaissance et la compréhension du consommateur à l'égard des commissions, durant les dernières années, l'emphase a été mise sur les obligations des conseillers quant à la divulgation de ces commissions. Nous prétendons qu'à court terme, cette méconnaissance ou cette incompréhension de la part du consommateur s'estompera. Tel qu'auparavant mentionné, nous préconisons, de la part du conseiller, une totale transparence envers le consommateur à l'égard de sa rémunération.

Actuellement, l'usage de l'aperçu du fonds permet au consommateur, à notre avis, de mieux comprendre le fonctionnement des commissions et de connaitre ce qu'il lui en coûte. De plus, les conseillers sont de plus en plus conscients de leur obligation d'expliquer leur mode de rémunération. Nous sommes donc d'avis que, si par le passé, les consommateurs déclaraient ne pas connaitre le mode de rémunération de leur conseiller, il pourrait en être tout autrement si nous leur posions la même question aujourd'hui ou dans un an.

Quant au contrôle des coûts, nous vous référons aux pages précédentes dans lesquelles nous avons abordé la question sous le titre « Fausse prétention que les consommateurs pourront mieux négocier les honoraires ».

Enjeu 3 : Les commissions intégrées qui sont versées ne concordent généralement pas avec les services fournis aux investisseurs.

Nos prétentions : Si nous suivons ce raisonnement, cette affirmation laisse donc croire que la seule solution envisageable serait la facturation à l'acte. Toutefois, une structure à honoraires semble être préconisée par le document de consultation publié par l'ACVM. Alors, concrètement, il n'y a aucune différence pour un consommateur entre le fait de payer 1% en commissions de suivi intégrées ou payer 1% en honoraires annuels. L'enjeu demeure donc le même.

Quant à la notion de « services continus » ou « prestation continue de conseils », il est évident que les conseillers ne peuvent suivre le dossier de chacun de leurs clients 24h/24 et 7 jours/7. Penser le contraire démontrerait une méconnaissance flagrante des implications d'une telle exigence.

De façon générale, il est à notre connaissance que les conseillers offrent une prestation de conseils auprès de leur client sur une base régulière et aussi, ponctuelle lorsqu'un besoin se fait sentir et adaptée à chacun des clients. Lorsqu'un consommateur considère qu'il n'en reçoit pas suffisamment pour son argent, il a tout le loisir de cesser sa relation d'affaires avec ce conseiller et décider de faire affaires avec un autre. Ce droit existe dans toutes les sphères des diverses activités économiques. Ceci s'appelle le libre marché de la concurrence.

Par ailleurs, il peut être facile de prétendre que le consommateur n'en reçoit pas pour son argent. Mais cette prémisse, doit-on l'avouer, peut être biaisée de différentes façons. Tout d'abord, dire cela, est l'expression d'un jugement de valeurs qui implique l'arbitraire. Pour un même niveau de service équivalent, une personne pourrait le considérer insuffisant et l'autre, penser qu'il est parfaitement adéquat. Aussi, a-t-on posé la question à des consommateurs qui utilisent un réseau qui n'offre pas de conseil ou qui font affaires avec de véritables conseillers? Par ailleurs, le niveau de services offerts à un client ne se résume pas au nombre de rencontres tenues avec lui durant une année ou au nombre d'appels téléphoniques. Tout le travail que fait le conseiller, hors la présence de son client, doit être tenu en compte : les analyses économiques, les formations sur différents produits, etc. Disons-le franchement, il arrive que le consommateur ne soit pas parfaitement conscient de tout ce qu'implique le travail du conseiller.

Ceci dit, nous prétendons qu'il est injustifiable que des consommateurs paient exactement les mêmes frais qu'ils soient conseillés ou non. Ainsi, les firmes de courtage à escompte, par exemple, ne devraient pas être autorisées à recevoir des commissions intégrées de suivi alors que le suivi est inexistant. S'il existe une aberration, c'est bien celle-là et c'est à elle que les ACVM devraient s'attaquer de façon prioritaire.

Enjeux de société

Dans la prochaine section, nous souhaitons attirer l'attention des lecteurs sur les conséquences possibles sur notre société d'une décision qui pourrait avoir comme effet de restreindre l'accès aux conseils pour les consommateurs.

L'autonomie financière des consommateurs

Résumée à sa plus simple expression, l'autonomie financière à la retraite signifie pouvoir cesser de travailler, après avoir accumulé des sommes suffisantes, tout en maintenant un train de vie pleinement satisfaisant pendant les 30 prochaines années.

Pour atteindre l'autonomie financière en vue de la retraite, il faut :

- Contrôler ses dépenses actuelles;
- Développer une habitude d'épargne disciplinée et structurée;
- Avoir un large éventail de produits financiers qui nous sont accessibles;
- Bien se connaitre soi-même et sa tolérance au risque;
- Bien connaitre le produit à choisir;
- Choisir les bons produits;
- Bien contrôler son émotivité à l'occasion des décisions à prendre;
- Et obtenir les rendements nécessaires.

Plus un consommateur a la capacité d'accumuler des sommes, plus il s'approchera de l'autonomie financière le moment venu.

Moins un consommateur a la capacité d'accumuler des sommes, plus il aura besoin d'avoir accès à des conseils de professionnels et à une large gamme de produits financiers. L'autonomie financière de ce consommateur est en péril s'il ne peut avoir accès à des conseils de professionnels.

À notre avis, le conseil professionnel est essentiel à la prospérité de tous les canadiens. Ceux-ci, peu importe leur situation financière actuelle, devraient avoir accès à des conseils de la part de personnes qualifiées afin de mieux planifier leur sécurité financière.

Au surcroit, nous sommes convaincus que ceux qui ont le plus besoin de conseils sont les plus petits investisseurs. Toute mesure ou initiative qui pourraient avoir comme conséquence possible de leur restreindre le conseil devrait être évitée. C'est le cas, nous le croyons, avec l'abolition des commissions intégrées tel qu'exposé dans ce document.

Depuis plusieurs années maintenant, la société canadienne est confrontée au désengagement prononcé de l'État dans les régimes publics. Les modifications structurelles apportées aux programmes de retraite publics et privés depuis les dernières années ont transféré aux ménages canadiens les risques liés au rendement des placements, à l'inflation, à la longévité et à l'évolution des marchés financiers alors qu'auparavant ces risques étaient largement pris en charge par les régimes publics. En conséquence, les consommateurs ne peuvent que compter sur eux-mêmes pour avoir une retraite telle qu'ils la souhaitent. Alors, ceux-ci devront, afin de maintenir un niveau de vie acceptable à la retraite, être disciplinés dans leurs investissements et obtenir les meilleurs rendements possibles.

Selon une étude réalisée par CIRANO (The value of financial advice, Claude Montmarquette et Nathalie Viennot-Briot, CIRANO, 2016), il est démontré que :

- On estime que 25 % des ménages canadiens couverts par un régime de pension agréé à cotisations déterminées (RPA-CD) ou par un REER collectif et 37 % des ménages ayant un revenu moyen-élevé sans RPA devront s'appuyer sur le patrimoine financier qu'ils auront personnellement accumulé pour vivre confortablement à la retraite.
- Au Canada, les données empiriques démontrent que les investisseurs individuels assistés par un conseiller financier accumulent un patrimoine financier beaucoup plus important. (jusqu'à 3.9 fois plus sur une période supérieure à 15 ans)
- Entre 2010 et 2014, les ménages qui ont abandonné le service d'un conseiller financier ont accumulé 45 % moins d'actifs financiers que ceux qui ont maintenu la relation avec un tel conseiller.

Ceci nous fait croire que toute initiative règlementaire pouvant avoir comme conséquence de restreindre le conseil aux consommateurs contribuerait à les appauvrir et, par le fait même à appauvrir la société dû aux impacts d'une telle initiative sur l'économie canadienne.

<u>Impacts à long terme sur l'économie</u>

Restreindre l'accès aux conseils aura inévitablement des conséquences sur l'accumulation de patrimoine de retraite pour plusieurs canadiens.

Point besoin d'être devin pour comprendre que moins les retraités auront de sommes disponibles à la consommation, moins ils dépenseront à la retraite et ainsi, moins ils injecteront de sommes dans le système économique.

En consommant moins, ils paieront moins de taxes à l'État.

En restreignant leur consommation, ils contribueront moins à la création d'emploi et d'entreprises. Moins de revenus pour les travailleurs en général et pour les entreprises, c'est aussi moins de sommes à être versées à l'État en impôts.

Ayant des revenus moins élevés à la retraite, ils paieront eux-mêmes moins d'impôts à l'État.

Bien que nous ne puissions prétendre être en mesure de quantifier exactement ces impacts, nous sommes convaincus de leur importance et de leurs conséquences négatives sur notre société et son économie.

<u>L'impact sur la relève dans l'industrie</u>

Un secteur d'activités sans relève est un secteur d'activités en déclin.

La relève dans le secteur des services financiers est déjà un enjeu depuis plusieurs années. Il est parfois difficile d'attirer et convaincre des candidats à se lancer dans cette industrie qui est très compétitive.

Disons-le, les 5 premières années dans la carrière sont cruciales et plusieurs quittent dans les premières années.

Les nouveaux conseillers commencent souvent leur entreprise en réussissant à ouvrir des comptes de clients de petites tailles ou de tailles moyennes. Assez rares sont ceux qui réussissent à ouvrir des comptes supérieurs à 100 000$ dans les premières années.

Pour réussir à convaincre les détenteurs de comptes majeurs, ils doivent souvent prendre de l'expérience et établir une certaine notoriété et crédibilité. Ceci prend souvent quelques années.

Le mode actuel de rémunération à commissions intégrées leur permet de recevoir des revenus, bien que modestes, sur les comptes de plus petites tailles. Advenant l'abolition des commissions intégrées, nous craignons que ces conseillers de la relève ne puissent plus ouvrir de plus petits comptes qui leurs assurent une certaine base de revenus. Ces consommateurs pourraient préférer se tourner vers une institution financière intégrée ou vers des solutions sans conseil. Aussi, les courtiers pourraient exiger certains minimums de taille de comptes, ce qui restreindra le développement d'affaires des nouveaux conseillers. Éventuellement privés des revenus tirés des commissions intégrées pour ces plus petits comptes, plusieurs nouveaux conseillers pourraient être dissuadés de poursuivre dans ce domaine.

L'autre façon de débuter dans le domaine est d'acquérir une clientèle existante appartenant à un conseiller bien établit qui quitte la profession. Pour que cette transaction d'achat de clientèle soit heureuse, celle-ci doit générer un certain revenu. Ne l'oublions pas, la plupart du temps, le jeune conseiller emprunte des sommes auprès d'une institution financière pour procéder à l'achat de cette clientèle. Il a donc des engagements financiers et il doit avoir une capacité de remboursement. Dans le cadre d'un achat de clientèle, le nouveau conseiller devrait tenir compte qu'il est possible, advenant l'abolition des commissions intégrées, qu'il doive se départir d'une portion de ces clients qui ont des comptes plus modestes. Il devra aussi considérer que parmi ces clients, plusieurs refuseront de payer des honoraires et quitteront. Ceci fragilisera inévitablement sa situation. Ceci pourrait même l'amener à être incapable de rembourser le prêt obtenu pour l'acquisition de ladite clientèle.

Dans ces circonstances, avant de se lancer dans le domaine des services financiers, il est donc fort possible que les candidats y pensent à deux fois et qu'ils y renoncent ne pouvant pas être assurés du succès d'une telle opération.

<u>Autres documents à l'appui de nos commentaires</u>

À titre complémentaire, nous nous permettons de vous soumettre trois études qui abordent différents éléments soulevés dans le présent document et qui supportent ceux-ci :

- **Bulletin #0721-C publié par l'Association des courtiers de fonds mutuels du Canada en date du 23 Mai 2017 :** Ce rapport expose des informations importantes concernant la valeur des investissements détenus par les ménages canadiens et démontre la répartition des avoirs investis par type de structure de rémunération. Il fait aussi ressortir le fait que 80% des ménages canadiens détient des actifs qui se situent dans la tranche de 0$ à 100 000$.

- **Global Regulatory Developments and Impacts publié par l'Institut des fonds d'investissement du Canada, en Avril 2017** : Ce rapport identifie les juridictions à travers le monde qui ont bannis les commissions intégrées et fait ressortir les impacts de tels bannissements. On dénote, entre autre, le fait que peu de juridictions ont décidé d'adopter la voie du bannissement des commissions intégrées.
- **Rapport 2017 de l'enquête de Fidelity sur la retraite** : **Retraite 20/20, Des conseils appropriés peuvent éclairer votre avenir, publié en Mai 2017 :** Ce rapport met en lumière les besoins des consommateurs d'obtenir des conseils professionnels afin d'atteindre leurs objectifs et mets en évidence le fait que les consommateurs ayant un plan sont mieux préparés à la retraite que ceux qui ne bénéficient pas de conseils. Ce document tend à démontrer la plus-value apportée aux consommateurs par les conseils de professionnels.

<u>Nos propositions</u>

Nous résumons ainsi les propositions que nous faisons, bien humblement, aux organismes de réglementation :

- Maintenir l'option des commissions intégrées et ainsi, donner le libre choix aux consommateurs parmi toutes les options de rémunération de son conseiller;
- Rendre obligatoire la divulgation de <u>tous</u> les frais, y compris les frais des gestionnaires de fonds, sur le rapport annuel de rémunération et frais devant être transmis aux consommateurs;
- Bonifier et clarifier l'information en lien avec les différents modes de rémunération possible ainsi que les frais des gestionnaires de fonds apparaissant sur l'aperçu du fonds;
- Rendre obligatoire, sur le formulaire servant à faire l'achat d'un fonds, l'inscription du montant, en dollars, de la commission à être versée au courtier pour cet achat ainsi qu'un estimé raisonnable de la commission de suivi, en dollars, qui sera versée au courtier;
- Rendre obligatoire, sur l'avis d'exécution transmis au consommateur, l'inscription du montant, en dollars, de la commission versée au courtier pour l'achat ainsi que l'inscription qu'une commission de suivi de x% sera versée au courtier;
- Accorder aux consommateurs un droit d'annuler la transaction en cas de désaccord en lien avec la rémunération apparaissant sur l'avis d'exécution qu'il recevra suite à une transaction d'achat de parts de fonds;
- Les réseaux de distribution ayant un modèle de distribution sans conseiller (par exemple, le courtage à escompte) ne devraient pas être autorisés à proposer des fonds à commissions intégrées;
- Interdire aux courtiers d'exiger de leurs employés/conseiller de vendre leurs produits exclusifs, de fixer des cibles de vente de leurs produits exclusifs et d'assortir ce type de

vente à des bonifications basées sur un volume de vente de produits internes. Si cette pratique était maintenue, il serait nécessaire que cette information soit divulguée clairement, et en temps opportun, aux consommateurs;

- Uniformiser les commissions de suivi intégrées. Pour réduire les risques de conflits d'intérêts, les régulateurs pourraient encadrer les rémunérations versées par les manufacturiers de fonds aux courtiers et aux conseillers. La commission de suivi pourrait être identique pour chaque société de fonds, quel que soit le produit financier distribué;
- Obliger les sociétés de fonds à mettre en place des mécanismes de réductions tarifaires automatiques tenant compte des sommes investies.

Conclusion

Nous demandons aux régulateurs de continuer de veiller à s'assurer que le cadre réglementaire de l'industrie continue de permettre les services de véritables professionnels à tous les Canadiens et de veiller à ne pas compromettre l'accès à des conseils pour les petits investisseurs. Cela signifie de donner aux investisseurs un accès continu à une large gamme de produits et services financiers adaptés à leurs besoins et à des prix compétitifs. Cela signifie également de ne pas imposer des réformes qui seraient disproportionnées par rapport à leurs bénéfices concrets et réels et qui seraient susceptibles de causer plus de tords que de bienfaits.

Dans tout processus de changement règlementaire, les organismes de réglementation doivent mesurer les impacts. Ils doivent se demander si les effets négatifs qu'entraineraient l'abolition des commissions intégrées sont proportionnels à l'objectif de vouloir mitiger les conflits d'intérêts. Nous invitons ces organismes à tenir compte de la balance des inconvénients et d'en faire bénéficier le consommateur!

Les organismes de réglementation du commerce des valeurs mobilières tentent de protéger les investisseurs tout en soutenant des marchés financiers efficients. Ils veillent, entre autre, à ce que les investisseurs bénéficient d'un accès équitable aux marchés. Avec respect pour l'opinion contraire, nous croyons que l'option d'abolir les commissions intégrées ne protège pas l'investisseur et ne lui permet pas de bénéficier d'un accès équitable aux marchés, pas plus qu'elle n'assure l'efficience des marchés compte tenu de la concentration prévisible, de la restriction de l'offre et des risques de perte d'intérêts possible d'une éventuelle relève.

Protéger les consommateurs de produits et services financiers, c'est aussi, et surtout, leur permettre l'accès à des conseils et à des produits diversifiés au meilleur coût possible, en toute transparence.

Nous demandons aux autorités règlementaires ainsi qu'aux divers paliers de gouvernement concernés de ne pas sous-estimer et bien mesurer les impacts négatifs que pourrait avoir l'éventuelle abolition des commissions intégrées sur notre société de demain et le sort éventuel de millions de consommateurs canadiens qui pourraient se voir privés de conseils. Soyons vigilants et optons pour une société qui donne les moyens aux consommateurs, à tous les consommateurs, de se bâtir une retraite satisfaisante!

En terminant, nous vous remercions de cette opportunité de vous soumettre notre point de vue quant aux questions soulevées.

Au besoin, nous demeurerons disponibles pour toute demande d'informations complémentaires ou encore, à participer à d'éventuelles rencontres d'échanges.

Veuillez accepter, Me Beaudoin, l'expression de nos salutations les plus cordiales!

COMMENTS REGARDING:
CSA CONSULTATION PAPER 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING ***EMBEDDED COMMISSIONS***

Prepared by: Keith R. Odegard
Date: June 8, 2017

Background

I am founder and Chief Financial Officer of an independent mutual fund dealer, Pewter Financial Ltd., which has operated continuously in Alberta since February, 1983. Our firm currently relies on embedded fees for approximately 95% of our revenue. As a very small dealer, we have adopted a low cost operating model which has allowed our firm to survive in spite of the costs of increased regulation. Due to the uncertain regulatory environment, we have not expanded the business since 1997 and have no plans to invest any additional resources into the retail mutual fund industry.

The comments that follow do not follow Appendix D – Summary of Consultation Questions, since I believe the issues raised below will not fit easily into the listed questions. Following the Socratic method of instruction, each of the following sections is followed by questions that securities regulators may wish to consider.

A. Tyranny vs. Freedom

The proposed action by the Canadian Securities Administrators ("CSA") to prohibit embedded commissions for mutual funds is at its most basic level the imposition of tyranny on residents of Canada. The proposal seeks to prohibit individuals of legal age ("the public") from making a contract that includes a provision for embedded commissions. Imposing the will of a dictatorial authority to limit the rights of individuals is tyranny. It matters not the intentions of the CSA to "protect" investors. A common theme amongst dictators was that their unilateral decision to take rights and freedoms away from citizens since this action was in the "best interests" of the population. The idea that Canadians do not have the capacity to make decisions and enter into contracts without the oversight of a supposedly benevolent regulator is both illogical and an affront to the principals of freedom and democracy upon which this country was founded. The CSA appears to believe that the public is incapable of making a private contract which includes embedded fee provisions, but the same public is entrusted with the responsibility of electing politicians that govern the country. These same elected politicians hire all securities regulators. Paradoxically, the CSA believes the public has the wisdom and sophistication to select the rulers that choose securities regulators but does not have the knowledge or ability to enter into private contracts that include embedded commissions.

Questions:

1. Does the reader believe that free and open societies are superior to closed authoritarian societies where citizens have limitations on their rights, including the right to freely make contracts (e.g. Canada vs. Venezuela)?
2. Does the reader wish to have their right to negotiate and agree to private contracts with other members of the society curtailed?

B. Tilting the Playing Field

The prohibition of embedded fees for mutual funds will favour entities that sell non-mutual fund products to the public. There are no other products in which the relevant regulators require that the retail/client contact person or entity has to be compensated separately from the other components of the product or service. For example, banks are not required to make a separate charge to customers for the costs of the bank employee that prepares the documentation involved with the customer purchasing a GIC. Life insurers are not required to prepare two invoices for their the customers, one for the charges of the life insurance agent retail services and another one for the all other charges grouped together (e.g. wholesale costs, administration costs, costs of the actual product, etc.). Embedded fees are used by virtually all industries, besides the financial service industry, that supply goods or services to the Canadian public. When selling an automobile, automobile dealers are not required to provide their customers with an invoice related to their services as retailers and another invoice that includes all non-retail components of the automobile (e.g. direct manufacturing costs, manufacturer administrative costs, marketing costs, etc.). Grocers are not required to identify the retail portion in the price of tomatoes. If the CSA insists that consumers are harmed when purchasing goods or services that include embedded fees, they should be lobbying for laws to ban embedded fees from all goods and services currently available in Canada. Targeting one area of the economy (financial services), and within that one industry area, one specific model of operations (independent retail mutual fund dealers) is not logical.

The imposition of this proposed regulatory overreach to ban embedded fees will diminish the ability of independent dealers to successfully compete against other product and service suppliers that are given free rein to design their own pricing/compensation policies. This policy will also further dissuade potential independent mutual fund dealers from entering the industry since it discriminates against one sector of the financial services industry (independent mutual fund dealers) and promotes another sector of the financial services industry (large entities that are both manufacturers and retailers of mutual funds).

Questions:

1. Why should the CSA be permitted to ban a specific compensation arrangement, when virtually all other goods and service providers are free to determine their own pricing/compensation model?
2. Does the reader believe all goods and service providers should be required by law to separate the retail and non-retail portion of the good or service when selling to the public?

C. Geographic Concentration of Financial Services Industry

The proposed policy will further concentrate the financial services industry in Toronto, Ontario by discouraging independent retail mutual fund dealers across the country. Rather than a widely dispersed industry that includes many small dealers that are independent from any one manufacturer, the proposal, through regulatory fiat, will unfairly support large financial institutions that have the ability and desire to both manufacture and retail their own mutual fund products. The concentration of all financial services in a limited number of large deposit taking institutions increases the risks to the financial system in Canada. This concentration of power can result in all the problems associated with the "too big to fail" philosophy, which places the risk of catastrophic failure of a large entity on the public, rather than with the shareholders and staff of the failing financial institution. The concentration of power and control of financial services in Toronto is detrimental to all other regions of the country, since decisions affecting non-Toronto regions are made by financial institutions based in Toronto. These decisions will likely be based on the best results for the Big Bank/OSC coalition. The current system of allowing local and regional retail independent mutual fund dealers to compete on a level playing field against the Toronto-based big banks results in a more stable financial system. Free competition amongst numerous suppliers provides the best results for the public, no matter what goods or service they are purchasing.

Questions:

1. Does the reader believe that limited competition that results from regulatory fiat is in the best interests of the public?
2. When making decisions regarding the purchase of any goods or services, does the reader prefer to have one choice or a wide variety of choices for the supply of the good or service?
3. Should the provision of virtually all financial services for Canada be controlled by institutions based in Toronto, Ontario?

D. Prohibition of Self Interest for Mutual Fund Dealers

CSA Staff Notice 81-327 includes the following statement (emphasis added):

We believe there is considerable scope for better aligning the interests of investment fund managers and dealers/representatives with those of the *investors they serve*.

The CSA appears to be under the misapprehension that the retail mutual fund industry exists to serve the interests of their clients. The CSA appears to believe that dealers are engaged in the industry as a charitable activity rather than as profit-seeking businesses. That independent mutual fund industry dealers exist to provide a “public good”, to Canadians. In Canadian society, suppliers of other goods and services are not required to operate their businesses on a charitable basis. Large banks and other businesses exist to earn as much profit as possible for their shareholders. No one else operating a business is required by regulators to operate the business as a charity. According to the regulators, mutual fund dealers are required to “serve” the public, not operate profit generating businesses. Paradoxically, while regulators are permitted on an individual basis to operate from self-interest (e.g. by seeking the highest salary and benefits from their public regulator employers), the self-interest of mutual fund dealers is attacked. It appears that securities regulators are permitted to act in their personal self-interest, but those working in the retail mutual fund business exist to “serve”. This approach is illogical. Securities regulators, large banks and independent mutual fund dealers and all Canadian businesses should all be permitted to act in their own self-interest (including the right to make private contracts), this is a fundamental tenant of a free and open society.

Questions:

1. Is it logical for the CSA to adopt the idea that one small specific segment (retail mutual fund dealers) of one sector of the economy (financial services) should be required to operate their business as a charity, while their direct competitors can operate as profit seeking businesses (e.g. banks, insurance companies, trust companies, etc.)?
2. Has the reader, if employed by the public sector, ever approached their supervisor and requested a reduction in the reader’s salary, since such a reduction would “serve” the public interest by reducing the cost of the reader’s salary to the public purse?
3. Why is the pursuit of self-interest acceptable for customers, regulators, banks, other businesses but not for independent mutual fund dealers?

E. Quest for Regulatory Perfection

The CSA appears to be searching for perfection in their design of a regulatory system. Rather than insuring that investors are informed of the nature of their proposed investment purchase (provision of a prospectus), the regulators have imposed an additional suitability standard. No other goods and services providers, to my knowledge, are required to meet a suitability standard test. For example, if a person wishes to purchase a home, the realtor is under no obligation to determine if the house chosen by the purchaser is “suitable” for their requirements. The Ontario Securities Commission (“OSC”) is pursuing an even higher standard for dealers, the fiduciary standard. The fiduciary standard is virtually impossible for a profit-making business to meet, since businesses exist to earn profits not “serve” customers. Any profit earned by a business is unacceptable, since the business should have been returned any profit to the customer to fulfill their fiduciary duty.

Rather than seeking a perfect regulatory system, the CSA's goal should be to operate a regulatory system which supports the fundamental foundational concepts of a free society, including the unfettered right of the public to enter into contracts with each other.

Questions:

1. Is it logical for the CSA to attempt to design a regulatory system that seeks perfection as a realistic goal?
2. Does the CSA have any obligation to support the fundamental principles of a free society in the design and enforcement of its regulations?

CONCLUSION

In the past 20 years, the level of competition in the retail mutual fund industry has diminished. The number of dealers continues to decline due to the uncertain regulatory environment. Dealers are forced to operate in an industry where the basic tenets of logic and fundamental principles of a free society are ignored. No logical entrepreneur would invest resources in a business environment where the regulators have unchecked power and are proposing to use that power to favour a specific class of competitors (large banks) over independent dealers. As a result, the Canadian public is left with fewer and fewer choices to meet their financial service needs. Many Canadians want to establish relationships with large banks that are manufacturers and retailers of proprietary financial products. Others wish to form life-long relationships with independent financial service retailers that have access to a wide variety of financial products from competitive manufacturers. In a free and open society, the Canadian public should have the freedom to choose the financial service provider that best fulfills their needs. This freedom should also include the freedom to determine the amount and method of payment of the compensation that the financial service provider will receive.

Québec, le 8 juin 2017.

Projet : CP81-408

Madame,
Monsieur,

Je m'adresse à vous en tant que client en fonds communes depuis plus de 25 ans. J'ai eu une discussion avec ma conseillère dernièrement concernant le projet des autorités d'abolir les commissions aux représentants en épargne collective. L'argument étant que les représentants autonomes sont en conflits d'intérêt.

Voici une fausse solution à un faux problème. Où est le conflit d'intérêt? Alors que ma conseillère peut m'offrir une diversité de produits venant de différentes compagnies. Ce qui n'est pas le cas pour les conseillers de mes deux institutions bancaires. Ceux-ci m'offrent les produits des institutions qui les emploient et qui leur mettent de la pression pour produire. Présentement, je fais affaire avec la TD et le mouvement Desjardins. C'est avec ma conseillère autonome que je fais le meilleur suivi et le plus de rendement sur mes placements.

Je suis parfaitement au courant qu'elle retire une commission sur mes placements et c'est tant mieux, parce que c'est à grâce à elle si je peux maintenir mon capital sur mon FERR depuis plus de 7 ans. J'espère qu'elle pourra continuer de recevoir des commissions sur nos comptes, parce que cela me donne une certaine garantie qu'elle sera encore là dans 10 ans.

Comme client, j'ai besoin de ma conseillère autonome. C'est elle qui me guide le mieux dans cet univers de la finance. Comme conseillers, ils (elles) ont tout à fait le droit de gagner leur vie. Je ne vois pas où est le problème par rapport aux commissions.
Un problème que je perçois, c'est la surcharge administrative que vous voulez imposer à ces personnes.

Je vous invite à revoir vos orientations et à supporter l'ensemble de ces conseillers autonomes au détriment des grandes institutions.

Sincèrement Vôtre

Guy Roy

Re: CSA Consultation Paper 81-408 Consultation on the Option of Discontinuing Embedded Commissions

Dear Sir/Madam:

Executive Summary

It is logical that the prosed changes to embedded commissions would be indirectly beneficial for the exempt market, as it effects a smaller proportion of our products and will create grave systematic risk for mutual fund dealers and independent brokerages. However, as indirectly beneficial as it could be for the exempt market, it is bad policy. Therefore, NEMA is against the proposed changes stated in CSA Consultation Paper 81-408 on the Option of Discontinuing Embedded Commissions. As an alternative, NEMA is supportive of investor choice through diversity in dealership business models in Canada, and transparency of compensation. It is concerning to us that the research presented in the proposal focuses on the micro results of investors paying more fees when working with advisors as opposed to the macro results of investors who work with advisors accumulating more wealth.

About Us

The National Exempt Market Association (NEMA) was originally founded in 2011 as the Western Exempt Market Association. We are an organization dedicated to the growth of the Canadian Exempt Market's public profile and the improvement of its reputation. Through our members, NEMA has firsthand insight and knowledge of the operation and corresponding needs of the Exempt Market in Canada. By nature, our members are generally small businesses that raise capital for other small businesses. As such, our members are much more vulnerable to changes in securities laws than larger firms and organizations who have the resources, both legal and financial, to absorb and adapt to such changes. NEMA appreciates the opportunity to comment on the CSA Consultation Paper 81-408 Consultation on the Option of Discontinuing Embedded Commissions.

Process of Compiling this Report

This response is a compilation of NEMA membership views from the exempt market. NEMA has been active in soliciting member and stakeholder feedback. In addition to a vast amount of email correspondence, NEMA participated in one-on-one conversations with members. Please note that this response addresses only those specific questions in the consultation paper that our members have indicated to be of the greatest importance, and compiled them into one response.

Response to the CSA Consultation Paper 81-408 on the Option of Discontinuing Embedded Commissions

It is outside the scope of the regulator's mandate to dictate market conditions, especially around remuneration structures for the private sector. The free market develops that based on stabilizing revenues and investor appetite for compensation models. Embedded commissions, if fully disclosed, increase alignment of the advisor with the investor (as they do not have to 'eat what they kill' and have a steady income stream). It is not in the investor's best interest to work with a brokerage or advisor that does not have a relatively consistent income stream, especially in a down market. NEMA asks the CSA to reflect on the compensation model options that Dealerships will be left with, whether it be fee only or salary with quotas, and reflect on the consequences of that. It is of our opinion that there will be far fewer dealerships, and the ones that remain will inevitably consolidate, leaving investors less choice and, in some cases, only bank provided options.

In addition, if embedded commissions are eliminated – they should be eliminated across the board. If enacted, the CSA should extend such a ban to all embedded structures in securities raises, including initial public offerings, banking products and insurance related products.

NEMA is not recommended a blanket policy of embedded commissions, but is illustrating that it is unreasonable to have these expectations for one area of distribution over the other.

NEMA feels compensation models need to be flexible for dealerships advisors, and the investors they serve. As an alternative to eliminating embedded fees, the full disclosure of such fees should be communicated between advisor and client at the time of the first phase of the sales cycle, when the mutual expectations are defined and agreed upon. This is not to say fees should be bartered, as one would do for a used car, but that the fees are stated and understood upfront.

Commission and related expense disclosure are disclosed in the exempt market, and have been for decades. The commissions are disclosed on the Risk Acknowledgement Form,[1] and the investor has to sign off on them before the sale. For retail investors, The risk acknowledgment form in our industry has always stated very clearly that amongst the real risk potential of losing all invested funds, and that the advisors recommended the product is being paid X for placing the investor in the deal.

Commissions and other related management expenses are disclosed in an Offering Memorandum (OM). Only about 20% of exempt market products currently have embedded forms of compensation, so it is understood that this is more of an issue with publically traded mutual funds. Since the real concern is about embedded fees in the Mutual Fund industry, a possible solution could be to create a Risk Acknowledgement Form for the mutual fund industry that indicates the potential risk of loss, and clearly states what the commissions and fees are relative to the fund being purchased.

In addition, as stated in the consultation paper, the results of the disclosure regimen of CRM II policy changes have just been implemented, which outlines what clients are paying for the services provided. The possible benefits and issues of the CRM II structure have not been discerned yet, so making such material industry policy changes at this time is rushed and duplicitous. We are cognizant that the regulators do not value disclosure models, and NEMA published a critical assessment[2] about the weak research methodology of the Cain, Loewenstein & Moore[3] studies from which this assumption is based.

[1] The Client Acknowledgement form is included in NI 45-106

[2] The Debated Impotence of Disclosure: http://theprivateinvestor.ca/the-debated-impotence-of-disclosure/

[3] *The Dirt on Coming Clean: Perverse Effects of Disclosing Conflicts of Interest* by Daylain M. Cain, George Loewnstein, and Don A. Moore. Published January 2005 by The University of Chicago; and *When Sunlight Fails to Disinfect: Understanding the Perverse Effects of Disclosing Conflicts of Interest* by Daylain M. Cain, George Loewenstein, and Don A. Moore. Published January 2010 by the Journal of Consumer Research.

The results indicated that the advisors gave higher values to the estimators under the direct conflict condition rather than the control condition. The values were higher still if the conflict was disclosed. The researcher's conclusion was that disclosure gives advisors a moral license to mislead the client. What the researchers also found interesting was the way the estimators acted with the information under the different groups. Estimators discounted the values from advisors, but they did not discount them enough to compensate for the additional premium the advisors put on the coin value they recommended to estimators, and estimator guesses were more inaccurate in the disclosure condition. From this, researchers concluded that disclosure is actually harmful for the estimators.

The validity of generalizing the results of this study to financial services (or any other industry) are limited. First, this was a game, similar to the game of bluff, there was no explicit moral or ethical obligation for the advisor to act in the estimator's best interests. In addition, there were no consequences for the advisor not to act in their own best interest. Second, the conflict of interest was direct, meaning the advisor profited at the estimator's loss, this total non-alignment would not happen in industry, as reality is much more complicated than that, especially when factoring in reputation risks. Third, there was not an option for investors not to play, or 'invest,' which is a consequence of real world scenarios. Finally, the advisor had very little information, they were given a range of money in the jar, but not the actual value, so advice, biased or not, was a guess.[4]

Similarly, It is concerning to us that the research presented in the proposal, such as the CSA commissioned paper, *A Dissection of Mutual Fund Fees, Flows, and Performance* by Douglas Cumming[5] generally draws conclusions that a client's investment performance is reduced when they pay embedded compensation to an advisor, so investors are being harmed by investing in recommended funds versus do it yourself (DIY) or low-fee models. In the micro results of investors paying more fees when working with advisors as opposed to the macro results of investors who work with advisors accumulate more wealth.

However, household finance does not fit into any clean textbook models, as there is complexity in conflicting goals, emotional issues, and subjective opinions on 'value' where advisors play a significant part, and should be compensated accordingly. The value of the advisor has been

NEMA
Suite 1020, 140 – 10 Ave SE
Calgary, Alberta T2G 0R1
www.NEMAonline.ca

ignored. For example, one robust industry study in the UK by Old Mutual[6] found that consumer's outcomes are more positive when consumers attain investment advice, with the average retirement income at 17,168 euros without an advisor, versus 20,873 euros with advice. Interestingly, when advice is paired with concrete goals, the average retirement income rose again to 24,175 euros – that is a significant increase in overall prosperity outcomes, and indicates that micro investment outcomes should not invalidate overall investor macro outcomes of overall wealth accumulation.

Concluding Remarks

NEMA is optimistic that the CSA will contemplate the comments received by us, and other industry participants, about the detriment of these proposals. NEMA recommends looking at how CRM II and other recent new legislation affects the market before enacting further changes. Implementing policy because a few other Commonwealth countries[7] have implemented policy to transition to fee only is, in our opinion, not a strong enough reason. Independent non-commissioned research should be looked at for this policy consideration, and in a few years the UK and Austria will be an ample case study and provide good guidance. In addition, enforcement actions against rogue advisors that harm investors are also recommended.

For further elaboration on our views or for questions, please contact Dr. Pettipas at cora@nemaonline.ca or 403-992-9809.

De : Patrick J. Carricato
Envoyé : 8 juin 2017 01:20
À : CSA ACVM Secretariat
Objet : One Advisor's Perspective about Embedded Fees

To the CSA Secretariat,

Advisors and financial institutions keep saying that the small investor will be hurt if embedded trailer commissions are banned. Why? Wouldn't advisors be able to charge the same 1%/ yr. out-of-pocket?

Before answering these questions let me first preface this with my particular circumstances. I've been a financial advisor for more than 22 years. I deal almost exclusively in mutual funds for my income. I provide my clients with as much service as they need and only ask for up to the 1% trailer commission as compensation (FE 0%). That means no front-end fees, no DSC fees, no switch fees, no transfer fees, no nominee account fees, no annual maintenance fee, and no account close-out fees. In other words, it is about the lowest full service cost that any investor could ask for. Since my only compensation is a percentage of AUM, my incentives are to keep client costs to a minimum and to keep their portfolio performance up to the best possible for their risk tolerance, objectives and time horizon. Our rigorous compliance system ensures that I cannot exceed this risk tolerance. These incentives are what I need for my best interest. These same incentives are also what my clients need for their best interest. So although I am already a fiduciary, my method has a best interest standard built-in. So when it is claimed that I have a conflict of interest, I would ask, what method would be better? Other methods that I have investigated either encourage bad behavior, and/ or involve more fees and /or involve conflicts of interest. Also, when it comes to the perceived conflict of interest issue presented by the regulators because I am paid by the fund companies, I would argue that it does not exist. According to Morningstar Canada, there are 10,774 commission based advice mutual funds vs. 628 no load do-it-yourself funds. The majority of the commission based funds pay a 1% trailer commission. Therefore, I am not tied to any one mutual fund company that could raise a conflict of interest issue and there is no shortage of being able to find some of the best, high quality mutual funds and managers in the industry. As a matter of fact, if I were compensated in any other form other than trailer commissions, I would still recommend the same mutual funds that I am currently recommending. That alone should be proof that I have no conflict of interest.

Now to the question at hand. Advisors like myself, treat embedded commissions as a pool of income from which they are paid to service their clients. Most of my clients generate a 1% trailer commission regardless of their account size. This allows me to provide the service my clients require regardless of how much they have. My experience has been that the younger, less experienced investors, with the smallest accounts require the most education and time to service. The clients with larger accounts don't complain because the 1% is standard across the industry and they know what my incentives are. However, if the trailer commission is no longer embedded, clients would be required to pay this 1% out-of-pocket. Larger investors would then expect more, and better service to match what they pay. Since there are only so many hours in a day, advisors would then need to shift their time toward the larger accounts to compensate.

At the other end of the spectrum, the 1% of a smaller, say $10,000 account, would only generate $100 of commission per year. At an hourly rate of $150, this translates to less than 1 hour per year for service. The annual KYC paperwork alone "without an appointment" would cost the advisor more than that. Add to that the required change from client-name account to nominee account will cost the client an extra

$100/yr. Therefore, the small investor would pay $200/ yr. or 2.0% to get less service than the embedded 1% provides now. If you include a "reduced" MER of say, 1.5%, the small investor would pay a total of 3.5% of AUM. That's a prohibitive fee for getting less service than the current average MER of about 2.5%, which includes the 1% trailer. The smaller investors will either leave voluntarily or be asked to leave by advisors who can't afford to service them. The end result is unhappy small investors and potentially unhappy large investors, if the advisors don't shift. That's a whole lot of unhappy investors.

A good analogy to all this is our healthcare system. It's universal so everyone pays a percentage of their income in taxes to fund the system. This means that the wealthy end up contributing the most to the system but still get the same care as the poor. If the cost of our system wasn't embedded, and everyone had to pay out-of-pocket, the rich would demand more, and better care, while the poorest would go without care at all. This, unfortunately, is what will happen in our financial world.

Re: Canadian Securities Administrators (CSA) Consultation Paper 81-408: Consultation on the Option of Discontinuing Embedded Commissions (Consultation Paper)

We are pleased to provide comments on behalf of Investors Group Inc. (Investors Group) on the CSA's Consultation Paper dated January 10, 2017 which seeks to assess the potential effects on investors and market participants of discontinuing embedded commissions; identify potential measures that could assist in mitigating any negative impacts of such a change; and obtain feedback on alternative options that could sufficiently manage or mitigate the investor protection and market efficiency issues identified by the CSA.

Our company

Investors Group is a diversified financial services company and one of Canada's largest managers and distributors of mutual funds, including the exclusive distributor of its own products. It carries out its distribution activities through its subsidiaries Investors Group Financial Services Inc. (IGFS) and Investors Group Securities Inc. (IGSI), which are members of the Mutual Fund Dealers Association of Canada (MFDA) and the Investment Industry Regulatory Organization of Canada (IIROC), respectively, with assets under management of over $85 billion as at April 30, 2017. Investors Group also carries out insurance advisory services through I.G. Insurance Services Inc. Serving our clients since 1926, Investors Group distributes its products and offers financial planning through 93 region offices, represented by over 4,500 representatives to approximately one million clients across Canada.

Investors Group is part of IGM Financial Inc., which is a member of the Power Financial Corporation group of companies.

Overarching Comments

Investors Group agrees with the CSA in the desire to better align the interests of investment fund managers, dealers and representatives with those of investors; to deliver greater clarity on the services provided and their costs; and to empower investors in the dealer compensation process. We are committed to improving our clients' financial well-being.

For over 90 years, we have firmly believed that building long-term relationships with clients is the best way to help individuals reach their financial goals at each stage of their lives. Our focus is on comprehensive financial planning that includes investments, retirement, tax planning, estate planning, insurance and mortgages. We have long encouraged and provided financial support to representatives to obtain the Certified Financial Planner (CFP) designation or, in Québec, the Planification Financière (F.Pl.) certification, which we believe instills high standards of competence and professionalism through rigorous requirements of education, experience and ethics. More recently, we integrated these programs into our internal training programs and in May of this year, we made the enrollment and completion of the CFP or F.Pl. for all representatives mandatory within a prescribed period. We further provide our representatives with financial planning support and training through comprehensive financial planning tools and access to financial planning, investment planning, retirement, mortgage, securities, tax and insurance specialists. As at March 31, 2017, approximately 1,578 Investors Group representatives hold a CFP or F.Pl. designation, and another 2600+ are working toward their certification.

We do not believe we should wait for regulators to tell us what is right for our clients. We should be doing that ourselves. Toward that end, we have developed at IGM Financial Inc. a list of seven commitments that reaffirm our core values, from putting our clients first to fostering a culture of excellence.[1]

On September 19, 2016, Investors Group announced that we would discontinue the deferred sales charge (DSC) purchase option for our mutual funds effective January 1, 2017. While DSC was created to provide discipline to long-term investing, we concluded that the marketplace had evolved. Investors Group remains committed to servicing mass-market households because we know that the benefit of advice on wealth accumulation is ongoing and significantly greater the longer the advice relationship.[2] While we do not anticipate the CSA's proposal to discontinue embedded commissions will impact our ability to provide a wide array of financial products and services to households with little to invest, in part because of the vertically integrated nature and size of our firm, we know that there will be many dealers and their representatives who may only be able to continue to service more modest clients because of the embedded commission model.[3]

Therefore, as the CSA deliberates on whether or not to proceed with a ban on embedded commissions, we believe an essential prerequisite for the CSA to consider must be for any reform to not disproportionately impact or favour certain registrants to the detriment of others. As the CSA acknowledges in the Consultation Paper, discontinuing embedded commissions does just that, favouring deposit-taker owned fund dealers who today already dominate investment fund distribution in Canada, and significantly disadvantaging independent and small fund dealers. This, we believe, could ultimately lead to an even greater concentrated market, with fewer choices for products and advisory services resulting in less innovation and competition in our capital markets, to the detriment of Canadian investors. We also know that fewer choices of compensation model

---

[1] Our stated commitments are: (i) inspiring financial confidence, (ii) putting our clients first, (iii) helping our clients reach their financial goals, (iv) keeping stakeholders informed, (v) fostering a culture of excellence, (vi) being a good neighbour, and (vii) making sound decisions for the long term.

[2] Advice has a sizeable and ongoing, positive impact on financial assets that increases with the tenure of the advice relationship, controlling for all other variables: the ratio of advised to non-advised financial assets was found to be 1:7 early in the advice relationship, growing to 3:6 for relationships 15 years or longer (Source: CIRANO, *The Gamma Factor and the Value of Financial Advice,* 2016).

[3] The MFDA indicates that MFDA members provide advisory services to close to nine million households in Canada, or about 56% of all Canadian households, and of them, about 83% (or 7.3 million households) fall within the mass-market space, defined as those with less than $100,000 in financial assets. MFDA non-deposit taker owned fund dealers form a significant part of the industry servicing 2.36 million households and licensing approximately 32,000 advisors within the MFDA membership, of which 56% (or 19,021) of these advisors have small books of business and predominately rely on DSC commissions to finance their operations (Source: MFDA Bulletin #0721 C – *MFDA Client Research Report: A Detailed Look into Members, Advisors and Clients* (May 23, 2017) ("MFDA Client Research Report")).

can limit access to advice and result in higher overall cost if only fee-based compensation services are available, particularly for households with more modest investment levels.[4]

Given these potential outcomes, we question whether the "complementary" benefits the CSA say may occur with discontinuing embedded commissions outweighs the very real and adverse impacts that will occur to some dealers, their representatives and most importantly, to Canadian investors.

We firmly believe that when fully implemented, the outcomes that will be achieved with the CSA's Point of Sale disclosure (POS) and Client Relationship Model (CRM) projects, together with the reforms in CSA Consultation Paper 33-404 (CSA CP 33-404),[5] will substantially address the key investor protection and market efficiency issues identified in the Consultation Paper. Moreover, as the Investors Group decision to discontinue DSC illustrates, we submit that the financial services industry in Canada today is undergoing rapid and significant changes due to investor preferences and competitive market forces independent of regulation, which is furthering the CSA's stated objectives.

Therefore, to the extent the CSA considers that there remains any regulatory gap, we believe that there are other regulatory options that the CSA can and must consider first that will, in conjunction with current regulatory reforms, address the CSA's concerns while maintaining investor choice, accessibility to advice and a fair and efficient capital markets. In our view, the discontinuation of embedded commissions is not required to address the key issues identified in the Consultation Paper.

---

[4] In the United States, the average total cost of fee-based advice is comparable to the cost of advice in Canada (2.00% to 2.20%), however the cost is higher for modest investors with less than $100,000 of financial assets (2.40%) than for high net worth investors (1.70%) (Source: Investor Economics & Strategic Insight, *Monitoring Trends in Mutual Fund Cost of Ownership and Expense Ratios: A Canada-U.S. Perspective,* 2015). Where regulation has been changed to ban or limit commissions, the absence of embedded compensation has been found to lower the cost of the product, but the cost of advice was seen to go up. It has also been found that in jurisdictions that have moved to fee-based compensation, those with less wealth or income found it more difficult to get advice than others. Ultimately, all forms of compensation affect advice and outcomes and there is not enough evidence indicating that fee-based compensation will lead to better long-term outcomes than commission-based compensation (Source: Mutual Fund Fee Research prepared for the Ontario Securities Commission on behalf of the Canadian Securities Administrators, written by Dr. Edwin Weinstein, PhD The Brondesbury Group, Spring, 2015 ("The Brondesbury Report")).

[5] CSA Consultation Paper 33-404 Proposals to Enhance the Obligations of Advisers, Dealers, and Representatives Toward their Clients (April 28, 2016). In our response letter to CSA CP 33-404, we identified some potential unintended consequences arising from the targeted reforms and provided some alternative suggestions where possible. We also stressed the importance of treating firms and advisors subject to the same proficiency requirements and standards of conduct the same, no matter the product shelf, and the need to provide firms and their representatives the flexibility to provide streamlined services and financial advice. In our view, the targeted reforms, applied consistently to registrants and business models, and with flexibility in the framework to recognize client engagements will vary in scope and services, can achieve positive outcomes for Canadian investors.

On this point, we believe it is noteworthy for the CSA to consider that while regulators globally have been focused on issues similar to those articulated in the Consultation Paper, a number of regulators and particularly government policy makers, when engaged in this review, have explicitly chosen not to ban embedded commissions. Their reasoning, in part, includes the recognition that it would be detrimental to impose a reform that will have a negative impact on independent and smaller market participants and create further concentration of asset management with deposit-takers. In New Zealand, policy-makers very recently decided to focus their regulatory efforts on the conduct of those providing financial advice, rather than imposing a ban or restriction on commissions, concluding that "banning commissions is not a 'silver bullet' that will improve the quality of advice".[6] While in the United States, we note that the Department of Labor (DOL) fiduciary rule still permits firms and their individual advisers to receive most common forms of compensation for advice to retail clients under the best interest contract (BIC) exemption, so long as the firm and adviser provide advice in the client's best interest, charge only reasonable compensation, and avoid misleading statements about fees and conflicts of interest.[7]

Given this global regulatory landscape, we believe the CSA should provide a more detailed analysis as to why the approaches taken in such countries such as Sweden, Hong Kong, Germany, New Zealand and Singapore, all of whom have chosen not to ban embedded commissions, would not be equally appropriate approaches for the Canadian market and for Canadian investors.[8] This analysis was absent from the Consultation Paper and we believe it is worthy of a more in-depth discussion and a public consultation before a regulatory decision is made to discontinue embedded commissions in Canada.

[6] Ministry of Business, Innovation & Employment (MBIE), *Factsheet – Review of Financial Advisers and Financial Services Providers Acts*, July 2016 (see also: MBIE, *Review of the Financial Adviser Act 2008 and the Financial Service Providers (Registration and Dispute Resolution) Act 2008*, July 2016. We also have seen Sweden's minister for Financial Markets and Consumer Affairs indicate that the government will be proposing legislation that will not ban commission-led sales of financial advice and products in order to allow investors to continue to have access to a wide range of products and advice (Source: Investment Europe, *Swedish government proposes not to ban commission-led sales*, May 24, 2016).

[7] The White House, Office of the Press Secretary, *Factsheet – Middle Class Economics: Strengthening Retirement Security by Cracking Down on Conflicts of Interest in Retirement Savings*, April 6, 2016.

[8] Currently, only four countries have imposed a ban on embedded commissions: Australia, Netherlands, South Africa and the United Kingdom. In the Netherlands, the discontinuation of embedded commissions is a voluntary arrangement among the five large banks that dominate investment fund distribution. While under the MIFID II reforms, the imposed ban on embedded commissions only applies to independent financial advisors, which make up only 11% of the European market. Despite MIFID II, a number of jurisdictions have concluded not to impose a ban on embedded commissions, including: Belgium, Denmark, France, Germany, Ireland, Italy and Sweden. Additionally, we have seen a number of other jurisdictions decide not to proceed with the regulatory option to discontinue embedded commissions, among them: Brazil, Hong Kong, India, Israel, Japan, New Zealand, Singapore and South Korea.

Structure of Our Response Letter

In our submission, we provide insights and specific data of our experience in the Canadian market, as well as offer alternative regulatory options for the CSA to consider that we believe address the stated concerns in the Consultation Paper. In the appendices to our letter, we provide more detailed responses to some of the operational and tax questions posed in the Consultation Paper and also give some insights into the value of active-management, which we find positioned in the Consultation Paper as being somehow an undesirable outcome for investors that will be remedied through the discontinuation of embedded commissions.

Our submissions are predicated on the desire that (i) we retain an innovative, competitive and fair financial services industry in Canada, which provides investors with access to choices to a broad range of products, manufacturers and dealers, and (ii) that financial advice in Canada remains accessible and affordable for mass-market householders.

Importance of Preserving an Innovative, Competitive and Fair Financial Services Industry in Canada

a. Avoiding regulatory arbitrage

As we have noted in prior consultations, it's important to remember that the securities industry is only one part of the financial services sector in Canada. Insurance and deposit products are also significant segments of the industry. For example, deposits and short-term savings vehicles in the bank branch channel account for approximately $1.2T, just slightly less than the approximate $1.4T in mutual fund assets in Canada.[9] We have long advocated that the obligations owed by registrants to their clients and the regulation of retail financial products should not depend on the legal nature of the investment vehicle being sold or the licence held by the registrant. Insurance and deposit investment products are also significant segments of the industry, and compete directly with the sale of investment funds. As the CSA is aware, there are embedded commissions and costs built in to many of these other financial products, notably segregated funds as well as spreads on guaranteed investment certificates (GICs) and daily interest accounts (DIAs).

From the client experience, it is only fair and reasonable that the same set of rules that apply to investment funds apply to other similar financial products. With the POS and CRM projects, as well as the proposals in CSA CP 33-404, there already exists a schism in terms of disclosure and registrant conduct regulation across the financial services industry in Canada. This, in our view, creates complexity and confusion for investors and can lead to inconsistent client experiences and investment outcomes.

We believe it is noteworthy that in each of the jurisdictions that has introduced a complete ban on embedded commissions, the ban has extended beyond investment funds. This is a very important distinction to what is proposed in the Consultation Paper. We welcome the CSA's support for a

[9] Investor Economics, *Household Balance Sheet*, 2015.

harmonized regulatory approach for similar products, and the recent paper by the Canadian Council of Insurance Regulators (CCIR) on segregated funds.[10] However, the potential for regulatory arbitrage remains. The Consultation Paper gives no indication of the timeline for the CCIR's review or a commitment for coordinated action with the CSA, nor is there any discussion in the Consultation Paper of whether a similar review is being considered by the Office of the Superintendent of Financial Institutions (OSFI) with respect to banking products, such as GICs and DIAs.

At Investors Group, we apply the same standards of conduct and compliance supervision as applicable to our duly registered securities and insurance representatives in each jurisdiction. For example, we have similar supervision programs for mutual fund and segregated fund recommendations, including trade review processes related to suitability in relation to client KYC information.

As part of the CSA's deliberations, the potential impact of product and regulatory arbitrage cannot be disregarded or discounted. We found it particularly disconcerting that the CSA suggests in the Consultation Paper that the high level of horizontal integration at deposit-taker owned dealers somehow leads these firms to focus less on any one business line and more on "gathering assets across all business lines and on directing clients to the appropriate business line". Respectfully, we submit the recent CBC Go Public reports suggest otherwise.[11]

Without harmonized product and registrant conduct regulation across the financial services industry, the concerns expressed by the CSA in the Consultation Paper with respect to embedded commissions and misalignment of interests will continue to be just as relevant in the distribution of other types of financial products. This in our view is inconsistent with the CSA's mandate of achieving strong investor protection and fair and efficient capital markets.

We therefore strongly urge the CSA to work collaboratively with insurance and banking regulators. Given the make-up of the financial services sector in Canada, we do not believe it is sufficient for the CSA to say that it "assumes" that the self-regulatory organizations and regulators of non-securities products will remain vigilant and take any necessary action in the case of non-compliance. Should a decision be made by the CSA to proceed with discontinuing embedded commissions, any such securities regulatory reform must only proceed if it is accompanied by concurrent and consistent regulatory initiatives for investment fund-like products across the insurance and banking industries.

b. Preserving a competitive and innovative industry

The CSA acknowledge that discontinuing embedded commissions will have more of an impact on some dealers (such as smaller independent dealers) than others. In fact, the Consultation Paper notes that a ban on embedded commissions will have little to no effect on deposit-taker and insurer owned dealers as most households who purchase investment funds purchase through such dealers, which dominate investment fund distribution. While the impact of a ban on embedded commissions may appear small in terms of distribution, we believe it is critical for the CSA to consider the important role non-bank dealers and manufacturers play in the Canadian market, especially relative to this segment's size.

The concentrated and vertically integrated distribution landscape in Canada has made it increasingly difficult for independent dealers and investment fund manufacturers to effectively compete and ensure investors retain access to choice in terms of financial advice and financial products. As the CSA now considers discontinuing embedded commissions, considering how such a regulatory change will affect the vibrancy of the financial services industry in Canada is critical, as this too has a significant impact on the client experience and investment outcomes.

In our view, the assertion in the Consultation Paper that "investment funds are less popular than traditional savings vehicles with mass-market households" is much more a result of the oligopoly and horizontal integration of the banks, than a testament to investor preference. We strongly disagree with what seems to be the CSA's sentiment that the avoidance of an "advice gap," because deposit-taker owned dealers in Canada will continue to service mass-market households, somehow negates the adverse impacts that a ban on embedded commissions may cause.

Market Forces are also Driving Changes Independent of Regulation that are Achieving Regulatory Objectives

We strongly believe that competitive market forces are already effecting industry changes that the CSA identifies as some of the positive outcomes that they expect may occur from discontinuing embedded commissions. In particular, we are seeing today (a) the growth and availability of direct-pay (negotiated advisory fee) options to all investors in all channels; (b) reductions in fund fees and fund fee complexity; (c) increased price competition and (d) market innovations in product distribution and advice.

a. Fee-based and direct-pay options continue to grow in all channels

The CSA is correct to identify that the share of mutual fund assets held in fee-based purchase options (F series) is growing, and growing quickly. Competitive market pressures are driving the growth of F series for many fund manufacturers, with frequent changes to the F series offering or pricing. Fee-based program assets as a percentage of total assets is gaining ground in IIROC platforms, and in full-brokerage the shift in advisor compensation is in-line with the shift to fee-based.[12] Investors Group, through IGSI, introduced non-discretionary Fee Based Accounts and dealer discretionary Separately Managed Account (SMA) programs in 2016.

b. Reduction in fund series and fund fee complexity underway

In the last few years, we have seen a number of proactive actions taken on the part of investment fund managers aimed at reducing fund fee complexity and series simplification. At Investors Group, we have made an ongoing and active effort to reduce the number of funds on our product list. Our perception is also that fund management fees and embedded distribution costs have become more uniform, and are continuing to decline. Finally, we continue to see fund managers either simplifying asset house-holding programs or move to a flat fee pricing strategy. While we believe there will always be some differences across asset-managers, in part because of competition and innovation, this dynamic innovative and competitive environment, coupled with recent regulatory changes, has led to improved client experiences and investment outcomes.

c. Increased Price Competition Occurring

In the last few years, we have seen a number of investment fund managers announcing fee cuts,[13] trailer fee cuts, administration fee cuts as well as an increasing number of share classes with lower MERs year-over-year.[14] Asset-weighted management expense ratios (MERs) and management fees for long-term funds[15] also continue to decline.[16]

d. Market innovations in product distribution and advice

The CSA is correct to identify the growth of online advice within the Canadian market. We were surprised, however, to see the CSA imply that the adoption by incumbents of online platforms will somehow have a negative impact on the pricing pressures these new entrants have brought to the market. We find no evidence in the Consultation Paper to support this assertion. Rather, we see this as an opportunity for incumbents to leverage new technologies to create efficiencies and enhance client experiences and investment outcomes.

In our view, the increasing innovation and technology we're seeing with online platforms will continue to offer investors additional choices both in services and products. Coupled with the impact of the proposals in CSA CP 33-404 and the POS and CRM projects, we anticipate there

will continue to be pricing and competitive pressures on more traditional registrant models to demonstrate alignment of overall services and advice with dealer compensation.

The Current Regulatory Initiatives underway achieve the Key Investor Protection and Market Efficiency Issues Identified by the CSA

a. Embedded commissions raise conflicts of interest that misalign the interests of investment fund managers, dealers and representatives with those of investors

Investment Fund Managers

Today we identify and respond to material conflicts of interest through avoidance, controls and timely disclosure. This includes disclosure related to our proprietary business model.

Our experience is that the majority of embedded commissions offered by investment fund managers in the market today are substantially the same across asset classes and series and that manufacturer margins and costs (management expense ratios) are decreasing. All of this means that fund managers today are aggressively competing on fund costs and performance. For Investors Group, the competitiveness of the market in which we seek to attract and retain not only clients but also representatives, requires that we compete on fund costs and most importantly, fund performance, in order to maintain and grow market share.

At Investors Group, we strongly believe in an alignment of interests between our Portfolio Managers and our clients and this principle underscores our approach to incentives. All our Portfolio Managers have a substantial financial interest in delivering competitive relative investment performance and those managers who deliver poor relative investment results simply do not receive incentives for that performance. We also believe that it is important to focus on long-term performance and as such the majority of our incentives are measured against 3-5 Year results. In addition, our Portfolio Manager deferred incentive program is designed to further enhance this alignment through co-investment where a portion of the managers' incentives are linked to the performance of the fund(s) they manage.

In our view, the introduction of the proposals in CSA CP 33-404 will impose further pressure on fund managers to compete on fund costs and performance. For firms with a proprietary product list, such as Investors Group, the know-your-product (KYP) proposals will require such firms to compare all of the products on their shelf against key criteria such as fees, costs and performance, to establish their relative competitiveness to each other and to the market. This, in our view, responds directly to the issue cited in the Consultation Paper with respect to research which finds that flows with embedded commissions, and/or where there is an affiliated dealer, may be less sensitive to past performance.

We therefore strongly believe that with the reforms and/or guidance that will emerge from the proposals in CSA CP 33-404, the CSA has effectively addressed any residual reliance fund managers may still have to compete on embedded commissions to promote sales or retain assets.

Dealers and their Representatives

The stated purpose of the proposals in CSA CP 33-404 is "to better align the interests of registrants with the interests of their clients". As we've indicated, we believe the CSA achieves this aim, and that CSA CP 33-404 addresses many of the concerns expressed in the Consultation Paper, namely that embedded commissions may encourage dealers and their representatives to recommend higher cost fund products, or promote a particular purchase option, that pays them a higher commission to the detriment of investor outcomes.

In fact, we consider the breadth of the proposed conflicts of interest reform and accompanying guidance in CSA CP 33-404 on compensation arrangements and incentive practices to capture much more than simply any potential influence caused by embedded commissions. The proposal requires firms to assess whether any remuneration could reasonably be expected to inappropriately influence how representatives deal with their clients. Investors Group supports this more principle-based approach to addressing all types of compensation bias, as this approach recognizes that conflicts of interest and the potential for misalignment of interests can exist in any fee model. As noted in The Brondesbury Report, "all forms of compensation affect advice and outcomes".[17]

Alternative Regulatory Option to Address Issue 1

***Cap Embedded Commissions* –** We believe that the CSA should consider further whether a maximum limit (cap) on the amount of the trailing commission that investment fund managers may pay to dealers and their representatives could solve for any residual concern related to this issue, as an alternative to discontinuing embedded commissions. As noted in the Consultation Paper, this option would not preclude dealers and their representatives from directly charging their clients commissions or fees, either as a supplement or a substitute to embedded commissions. It could also serve as an interim step, to measure if standardizing and reducing the variability of trailing commissions across funds sufficiently reduces any residual incentives for dealers and their representatives.

It surprises us that the CSA states that in pursuing this option it would be taking on a non-traditional role to set fee caps and that it would be very challenging to determine and justify the appropriate cap rate in the circumstances. The U.S. Financial Industry Regulatory Authority (FINRA) imposes limits on embedded 12b-1 fees. We also note that the CSA does, in fact, set fees, most recently lowering the cap on active trading fees that are listed on a Canadian exchange.[18] We submit the CSA could, *through a public consultation process*, come to similar appropriate caps for embedded commissions paid by the manager. As we discuss below, we believe the other issues identified with embedded commissions are effectively addressed (or can

[17] The Brondesbury Report, p 4.

[18] CSA Amendments to National Instrument 23-101 Trading Rules and Companion Policy 23-101CP to National Instrument 23-101 Trading Rules (January 26, 2017).

be through other regulatory options) and so the "shortcomings" raised by the CSA with respect to this option in not addressing all of the other concerns raised in the Consultation Paper should not be seen as a barrier to proceeding with this more measured approach.

b. Embedded commissions limit investor awareness, understanding and control of dealer compensation costs

We believe the POS and CRM projects address the issues the CSA has identified with respect to embedded commissions limiting investor awareness, understanding and control of dealer compensation costs. From the beginning, the POS project was intended to increase investors' awareness and understanding of such costs, as well as better equip investors to compare the costs of one mutual fund to another, and to understand the impact of such costs on their investment returns. In fact, the CSA went even further in expressing the anticipated benefits of POS in an early release, indicating that some anticipated benefits of a more effective disclosure regime would include a heightened engagement of investors in determining the product and compensation costs, with "less risk of investors buying inappropriate products or not fully benefiting from the advice services they pay for".[19]

Similarly, the CRM reforms introduced, in the first phase, new relationship disclosure to investors at account opening, explaining the types of products and services provided by the dealer as well as more fulsome information on charges, including transaction charges, which they may expect to pay in connection with their investment.[20] Phase 2 of CRM (CRM2) next introduced new annual account level reporting on charges and other compensation of commissions and other amounts paid to dealers, including any embedded commissions in dollar amounts. Like the POS project, the CRM project was intended not only to increase investors' awareness and understanding of dealer compensation costs, but to also lead to better, more informed decision making when it comes to dealer compensation costs and the corresponding level of service that's being provided.

The CSA has identified investor knowledge, attitude and behaviour, registrant practices, fees and product offerings, as all possible positive impacts of the POS and CRM2 projects.[21] With this in mind, we do not agree with the suggestion in the Consultation Paper that discontinuing embedded commissions is necessary to create greater investor fee awareness, or opportunities to negotiate and have greater control over dealer compensation. It's our understanding that this is exactly what the CSA's research project to measure the impacts of POS and CRM will tell us. This position

---

[19] CSA Notice and Request for Comment Implementation of Point of Sale Disclosure for Mutual Funds (June 19, 2009).

[20] This includes the initial sales charge and DSC options and any trailing commissions or other embedded commissions paid.

[21] See press release: CSA to Measure Impact of Point of Sale Amendments and Phase 2 of the Client Relationship Model (August 22, 2016).

also seems contradictory to the ongoing regulatory work by the MFDA and the CSA[22] to move forward with still further disclosure enhancements to CRM2 as an effective way to make investors more aware of the embedded fees paid to issuers, such as mutual fund management fees, and the non-cash incentives that may be paid to the dealer or adviser and its representatives.

Alternative Regulatory Options to Address Issue 2

Dealers Offer a Direct-Pay Option – If the CSA concludes that there continues to be a necessity to further promote investor understanding of dealer compensation costs and empower investor engagement over how such costs are paid, we recommend the CSA consider and consult on the regulatory option of requiring dealers with an embedded commission option to have a direct-pay arrangement available to all clients. This option, we would envision, could allow investment fund managers to facilitate investors' payment of dealer compensation, as contemplated by the Consultation Paper. The direct-pay option could be offered and explained alongside the embedded commission option at account opening for new clients, and by notice to existing clients, giving clients a clear choice in remuneration methods.

Enhance Annual Report on Charges and Other Compensation – CRM2 does not extend to the ongoing costs of owning securities with embedded fees paid to issuers, such as mutual fund management fees and operating expenses. As a way to make clients more aware of such fees, the CSA could proceed with the proposals published in July, 2016,[23] to add a general notification in the annual report that would remind clients invested in mutual funds, or other securities with embedded fees, about these costs and that such costs may reduce the client's investment returns. The CSA has also suggested adding specific disclosure to the annual report on the non-cash incentives that may be paid to the dealer or adviser and its representatives.

We welcome the CSA's continued review and consideration of expanding CRM2 to include the full management expense ratio (MER) of investment funds. Should this work proceed, we believe that it will be important that there be corresponding disclosure to investors of the ongoing costs of similar financial products with embedded commissions, such as the spread on GICs and DIAs.

c. Embedded Commissions paid generally do not align with the services provided to investors

The concern raised by the CSA in the Consultation Paper of the need for advice and services to better align with the costs paid by investors (directly or indirectly through the trailing commission) is an important issue. However, just as all forms of compensation may affect advice and outcomes, in our view this issue of advisory services aligning with dealer compensation paid is

---

[22] MFDA Bulletin #0671-P – Report on Charges and Compensation – Consultation Regarding Cost Reporting for Investment Funds (December 18, 2015) and CSA Notice and Request for Comment on Proposed Amendments to National Instrument 31-103, Companion Policy 31-103CP and National Instrument 33-109 (July 7, 2016).

[23] Ibid.

an issue not limited to an embedded commission model, nor solved by discontinuing such payments.

Today fee-based accounts, which are the predominant direct-pay arrangement in the market, are typically based on a percentage of the client's assets under management, without necessarily being customized to the investor's specific needs or reflective of the level of service delivered. Clients selecting a direct-pay option today may not be aware of the fee levels other clients are paying, often will have no market strength to negotiate fees, and may not realize or be able to calculate the impact those fees have on the returns of their portfolio. In fact, we have seen IIROC, in their review of compensation related conflicts, indicate that fee-based accounts may not always be in the best interests of clients.[24] As noted in The Brondesbury Report, no empirical studies have been done to document whether investors have greater after-fee investment returns with fee-based compensation instead of commission-based compensation.[25]

We believe the increased performance reporting and saliency of fund costs and dealer compensation created by the POS and CRM projects will lead to better alignment of overall services and advice with dealer compensation paid. The CSA has indicated that these initiatives, fully implemented, are expected to prompt investors to question the overall level of services and advice they are receiving, which in turn is anticipated to cause representatives to better demonstrate their value proposition or, lead to investors switching to lower-cost alternatives, including online platforms. If the CSA's articulated aims for the POS and CRM projects are met, investors will be empowered to make more informed decisions on whether the commissions they're paying, whether embedded or not, are commensurate with their specific needs, expectations and preferences for service and advice.

We also believe, contrary to what's expressed in the Consultation Paper, that the proposals in CSA CP 33-404 will, in fact, have an impact on aligning compensation with services provided to investors. In our view, the targeted reforms, particularly the proposals related to know-your-client (KYC) and suitability, will create a more consistent minimum level of service and advice to be provided to investors, a key objective of the proposals. This in turn, we anticipate, will prompt greater competition amongst dealers and their representatives to demonstrate their value proposition and review the level of services provided to their clients, again, whether the compensation is embedded or not.

Finally, we strongly support the proposals in CSA CP 33-404 for increased proficiency for representatives, mandated on-going continuing education (CE) requirements and for allowing only the use of designations earned through an approved credentialing organization. Heightened proficiency and CE on key securities regulatory obligations such as suitability, KYC and KYP as well as conflicts of interest and ethics will, in our view, further help to ensure a consistent quality

of service is provided to all investors. As we indicated in our response letter to CSA CP 33-404, we encourage the CSA to consider mandating a financial planning designation as a way to instil a high standard of competence and professionalism in the financial services industry.

Alternative Regulatory Options to Address Issue 3

***Enhanced Dealer Supervision* –** The CSA's concern that the "one-size-fits-all" nature of embedded commissions may continue to be misaligned with the services and advice actually provided to investors is, as we've noted, just as relevant a concern in direct-pay arrangements. Accordingly, we propose that if the CSA wants to fully address the issue of alignment of the costs paid by individual investors with the services and advice provided, a more impactful regulatory option for the CSA to consider would be, as part of the next iteration of CSA CP 33-404, to explicitly enhance the guidance related to existing dealer obligations; specifically, to clarify the need to supervise that a commensurate level of advice and service is in fact being provided in exchange for the payment by the dealer to the representative, whether that payment is embedded or not.

***Greater Specificity at Account Opening* -** The CSA could also require that the relationship disclosure delivered to clients at account opening include greater specificity as to the advice and services that will be provided in exchange for the dealer compensation to be paid.

***Mandating only "D" Series be Available on Discount Brokerage Product Lists* –** Finally, while we agree with the CSA that it may not be desirable for the CSA to compel investment fund managers to create a new "execution only" series (typically denoted "D" series which has a reduced trailing commission), we would encourage the CSA to proceed with mandating that discount or order-execution only (OEO) dealers be required to only distribute D series or a series without any advisory commission on their product list. This will address the issue the CSA has identified in the Consultation Paper that the majority of mutual fund series sold through the online/discount brokerage channel are the full trailing commission fund series despite the increased availability of discount/DIY fund series in the market.

This regulatory initiative would allow the CSA to address the specific issue of investors who do not seek services and advice to not inadvertently pay for them. We believe this change could be easily implemented by amending IIROC Member Rule 3200, which sets out the minimum requirements for IIROC dealer members seeking approval under Rule 1300.1(t) to offer OEO services. We note that IIROC recently issued guidance for comment on OEO services and activities, which makes this proposal timely.[26]

[26] IIROC Notice 16-0251 Guidance on Order Execution Only Services and Activities (November 3, 2016).

The importance of Retaining the Accessibility, Choice and Affordability of Financial Advice

a. The importance of preserving financial advice for Canadians

According to Investor Economics, 63% of the $3.8T in personal financial assets is held in accounts where a financial advisor is engaged.[27] Personal savings is a key component to the accumulation of financial wealth and retirement readiness. In this regard, the role of financial advice is a critical element, contributing positively and significantly to the retirement readiness of Canadians.[28]

As the CSA has noted, evidence shows that the average individual's knowledge of basic financial products and concepts is quite limited. In fact, in the 2016 CSA Investor Education Study,[29] it was found that investors' primary source of investment information comes from their advisors. A 2016 Pollara survey among mutual fund investors highlights the confidence investors have in financial advice and the positive savings behaviours they've adopted because of advice.[30]

Economic theory explains that there is a net positive value of using a financial advisor.[31] In addition, financial advisors play an important role in counteracting the behavioural biases of investors by coaching them towards long-term savings habits, advising against panic sales, and providing good quality information to promote better long-term decision-making. [32]

---

[27] Investor Economics, *Household Balance Sheet*, 2016.

[28]Canada's retirement system is well balanced and effective, with 83% of Canadian households on track for retirement. Of the mid- to high- income households with no employer pension plan, "savers" (i.e. households with an above-average savings rate) are far more prepared for retirement than "non-savers" (i.e. households with a below-average savings rate). "Savers" are almost twice as likely to use financial advice and significantly more likely to use tax-advantaged savings vehicles such as RRSPs and TFSAs than non-savers – both of which are linked to increased financial security in retirement (Source: McKinsey & Company, *Building on Canada's Strong Retirement Readiness,* Feb 2015). Canadians over 65 rank 7th highest among OECD countries in terms of relative income compared to the national mean income of the total population, and have the 11th lowest poverty rate – on both measures, ranking better than the USA, UK and Australia. (Source: OECD, *Pensions at a Glance*, 2013).

[29] Key Highlights CSA Investor Education Study 2016 prepared for the CSA by Innovative Research Group, Inc., April 2016.

[30] Pollara, *Canadian Investors' Perceptions of Mutual Funds and the Mutual Fund Industry,* 2016.

[31] PricewaterhouseCoopers, *Economic Impact Assessment of Banning Embedded Commissions in the Sale of Mutual Funds* (Submission by the Investment Funds Institute of Canada on Consultation Paper), June 2017.

[32] Benzartzi & Thaler, *Heuristics and Biases in Retirement Savings Behavior,* 2017. The authors identify the biases as loss aversion, short-term thinking and overconfidence.

Research has demonstrated the significant value of the advice model to the investing public, at all demographic, income and asset levels. Among other things, advised households (i) are twice as likely to save for retirement at all ages (ii) have significantly higher levels of investable assets at all ages (iii) improve their regular saving for retirement at all income levels (iv) rate themselves as more financially knowledgeable, and (v) are more confident in their ability to achieve a comfortable retirement.[33]

A number of academic studies (in Sweden,[34] Australia[35] and the United States[36]) provide tangible estimates of the significant positive net benefits that financial advisors provide to investors through a holistic approach of financial wellness. We have similarly seen this demonstrated in recent Canadian research.[37] In fact, this research found that not only do investment outcomes improve with advice tenure, but that an interruption in the client-advisor relationship can worsen client investment outcomes.

The value of financial advice is not simply the value of selecting securities to invest in. The value proposition includes providing ongoing financial education, making appropriate investment policy decisions around portfolio construction and regular rebalancing, tax planning and most importantly, in providing behavioural advice and coaching with respect to client habits around

---

[33] Advised households are not only more likely to save but save at twice the rate of non-advised, passive households (8.6% compared to only 4.3%) and among the behavioural disciplines, savings is the most affected by the presence of advice. Controlling for all other explanatory variables, having a financial advisor has been found to increase the probability of a respondent declaring confidence in achieving a comfortable retirement by more than 13% relative to a similarly situated non-advised respondent (Sources: CIRANO, *Econometric Models on the Value of Advice of a Financial Advisor*, 2012 and *The Gamma Factor and the Value of Financial Advice,* 2016). Advised households, at all age levels, are twice as likely to save regularly for retirement than non-advised households, with advised households having higher net worth than non-advised households across all ages and income levels (Source: IFIC *The Value of Advice,* 2011).

[34] In Sweden, researchers compared a group of investors who received financial advice and a control group of investors who did not receive financial advice and assessed the impact on savings of having a financial advisor to be an additional 22% saved (Source: Hermansson & Song, *Financial advisory meetings and their impact on saving behavior – a difference-in-difference analysis,* 2016).

[35] KPMG EconTech used a regression analysis and estimated the impact of having a financial advisor to be an additional $1,590 per year in savings greater than investors without advisors. The analysis controlled for factors that influence savings behaviour such as income, wealth and employment (Source: KPMG EconTech, *Value Proposition of Financial Advisory Networks – Update and Extension,* January 18, 2011).

[36] In the United States, researchers showed that using a financial advisor improves savings behavior through the positive impact on overall financial planning including awareness of retirement needs and diversification of retirement savings. They additionally highlighted the better response of the advised to the financial crisis in 2008 compared to those without advice (Source: Marsden, Zick & Mayer, *The Value of Seeking Financial Advice,* 2011).

[37] Ibid., footnote 34.

savings and market discipline.[38] The importance of these aspects of the client-registrant relationship should not be underestimated. As part of the CSA's deliberations, the CSA should be mindful of not proceeding with regulatory changes that may diminish the range and choices of advisory services provided to Canadians.[39]

b. The importance of ensuring there remains choice in advisory services, that is affordable and accessible for modest investors

Financial advice is not only used by the wealthy. Approximately 47% of households in Canada with less than $100,000 in assets use financial advice, compared to approximately 56% of households with greater than $100,000 in assets.[40] This is significantly greater than other countries, such as Australia and the U.K.[41]

Modest investors (those with under $100K in investible assets) make up 80% of all Canadian households,[42] and 83% of the households serviced by MFDA members.[43] We also know that in 40% of cases where there is a financial advice relationship it was initiated with financial assets not more than $10,000. In addition, in 70% of such instances, investments were under $50,000 at the start of the relationship.[44] This means nearly three quarters of all advice relationships begin with financial assets of not more than $50,000.

---

[38] Beyond active management ("Alpha") and asset allocation ("Beta"), better financial planning decisions ("Gamma") have a significant impact on an investor's retirement outcomes. "Gamma" can increase the arithmetic "Alpha" on a portfolio by approximately 1.59% (Source: Morningstar, *Alpha, Beta and Now… Gamma,* 2012).

[39] We note that among Canadians, a recent global study found that there's still a strong preference for taking guidance from a human financial advisor over advice generated through an algorithm powered by artificial intelligence (Source: HSBC, *Trust in Technology: Country Report/Canada*, May 24, 2017).

[40] Ipsos Reid, *Canadians & Financial Advice*, 2015.

[41] In Australia, only about 10 percent of the population receives advice in a given year (Source: Rand Corporation, *Financial Advice Markets – A Cross Country Comparison,* 2015). In the U.K., approximately 17% of the population currently uses advice (Source: BlackRock, *Global Investor Pulse Survey,* 2015).

[42] Investor Economics, *Household Balance Sheet*, 2015.

[43] MFDA Client Research Report, p 6.

[44] Pollara, *Canadian Investors' Perceptions of Mutual Funds and the Mutual Fund Industry,* 2016. These percentages have been nearly identical for the last three years.

The willingness to pay upfront for advice (direct pay arrangements) depends on the level of wealth, formal education and financial knowledge of the investor.[45] Most Canadians also still have a strong preference for taking guidance from a financial advisor over online platforms.[46] Therefore, it is critical that the regulatory framework continues to promote Canadians' engagement to seek and obtain the delivery of financial advice when they are just beginning to save, by ensuring financial advice remains attainable in terms of cost, administration and delivery.

Conclusion

We firmly believe that the impact of the regulatory actions taken to date by the CSA, once fully implemented, together with the changes already underway in the Canadian marketplace, substantially address the concerns identified by the CSA in the Consultation Paper. To the extent that there remains any regulatory gap, we believe that the CSA can achieve the desired regulatory outcomes through alternative regulatory options that sufficiently manage or mitigate the issues identified in the Consultation Paper, without the same adverse impacts that a complete discontinuance of embedded commissions may cause.

The market and business models are changing at a rapid pace, particularly with respect to compensation structures, as evidenced by our own transformation. We would encourage the CSA to allow this evolution to continue, without the further regulatory intervention of a ban on embedded commissions. Preserving choice and accessibility to high quality financial advice as well as an innovative, competitive and fair financial services industry, is critical.

As the CSA moves forward in its deliberation on CSA CP 33-404 and the Consultation Paper, we encourage the CSA to consider the formation of working groups with market participants, to assist not only in identifying and working through various operational questions and issues, but to effect as seamless a transition process as possible for investors. We envision a model where the CSA would commit to ongoing and frequent engagement with stakeholders throughout any implementation process, to assess whether further CSA guidance and/or any extension of a transition period is needed.

Investors Group welcomes the opportunity to participate in such an endeavour.

……….

We thank you for the opportunity to provide comments on the Consultation Paper. We look forward to an ongoing collaboration. Please feel free to contact Donald MacDonald, Senior Vice-

Jeffrey R. Carney
President and Chief Executive Officer

Appendix - Tax Impacts

Overview

Generally, mutual funds pay a management fee to the investment fund manager, and the investment fund manager then compensates the dealer out of its management fees. Within this structure, the management fees paid to the investment fund manager are deducted by the fund to arrive at taxable income. Typically, in a mutual fund, distributions are paid to the investors to eliminate taxable income in the mutual fund. If there is a ban on embedded commissions, then the management fees paid by the mutual fund are reduced, and conversely the taxable income of the mutual fund would increase. There would be additional taxable income in the mutual fund requiring additional distributions to be paid to investors to eliminate taxable income in the mutual fund.(1)

In a direct-pay model, the investor is responsible for compensating the dealer. Generally, these advisory fees are tax deductible to the extent that these fees are reasonable, are for non-registered accounts, are not commissions, and are:

- For advice as to the advisability of purchasing or selling a specific share or security of the taxpayer, or;
- For services in respect of the administration or management of shares or securities of the taxpayer.

Generally, the additional distributions paid to investors should be offset by the advisory fees paid to the dealer.

In order to facilitate the payment/collection of the advisory fees, the investment fund manager/investor/dealer may agree to redeem units to fund the payment of the fees. The advisory fee is subject to GST/HST/QST (Sales Tax).

We set out below our observations of the key implications to investors, investment fund managers and dealers in transitioning all clients to direct-pay arrangements.

Impact of Removing Embedded Commissions	**Investor**	**Investment Fund Manager**	**Dealer/Advisor**
More fund series are likely to require distributions and quantum of distributions are likely to increase	Additional administration required to track distributions and report for tax purposes.	Increased demand on system resources to process higher volume of distributions.	Additional system resources to track the transactions. Additional investor support to track and understand transactions
Tax neutrality of “embedded commission” component not ensured	Tax deductibility of fees paid by the investor to its dealer dependent upon the services being provided in exchange for the advisory fees being charged.	N/A	Communication with the investor to be managed
Additional volume of transactions as a result of redemptions to fund direct-pay fees	Additional administration required to track transactions and report gains/losses for tax purposes including monitoring superficial losses.	Increased demand on system resources to process higher volume of transactions.	Additional system resources to track the transactions.
Advisory Fee subject to Sales Tax	Amount of Sales Tax payable by the investor on the advisory fee will be determined by the investor’s province of residence as opposed to the	Impacted to the extent the investor’s units in the funds are redeemed to pay for the advisory fees. The investment fund manager requires the systems to determine the quantum of the	Exempt commission paid by the investment fund manager being replaced by a taxable advisory fee paid by the investor. Systems to be enhanced to handle

	"blended rate" of the fund. Generally, Sales Tax paid will be added to the cost of the advisory fee.	Sales Tax to withhold on behalf of the dealer.	the additional administration and compliance required to collect, report, and remit the Sales Tax (and related taxable revenue).
Rationalization of fund series would require an exchange of investors' units within a fund	Generally, an exchange of units from one series of a fund to another can be accomplished on a tax deferred basis. Eliminates a level of complexity in understanding offering.	Initial increased demand on system resources to process transfers to be offset by ongoing administrative efficiencies due to reduced number of series. Simplifies investment fund manager's offering.	Initial additional system resources to track the transfers to be offset by ongoing administrative efficiencies due to reduced number of series. Eliminates a level of complexity in product offering.

(1) A mutual fund corporation can only distribute (by way of dividend) its net capital gains and dividends to shareholders. A reduction of management fees within the corporation could result in trapped income, which would be subject to tax. The end result is double taxation on the income; once in the corporation and again in the investor's hands upon redemption.

Appendix – Operational Impacts

Overview

We believe that consistent with the predominant trend in direct-pay arrangements today most dealers would, if embedded commissions were discontinued, shift to a fee-based account model, which is typically based on a percentage of the client's assets under administration. On review of this structure, we have identified the following primary operational implications of mandating this type of direct-pay arrangement:

1) Developing the systems and processes necessary to collect and report client fees for a much wider range of clients and account types;

2) Increased transaction volumes and client reporting which may increase dealer and investment fund manager administration costs;

3) Enabling the charging of fees in some registered account types that have rules regarding withdrawals for the purposes of paying fees; and

4) Transitioning existing clients' funds positions and systematic purchase and redemption transactions to direct-pay accounts.

1) Systems and process changes

Changing systems and processes to administer direct-pay arrangements will require significant effort and expense by dealers and investment fund managers.

Client name accounts will be particularly challenging to automate and effectively administer and report on a client's fee payments, because transactions to collect the account fee must be charged directly to one or more mutual fund positions held within the account. Direct-pay arrangements for mutual funds in accounts held in nominee name and administered on a nominee systems platform, on the other hand, will be able to be administered more effectively and efficiently.

Nominee accounts allow for a cash position through which all securities buys, sells and daily calculated and accrued account fees can be processed. A cash position enables the client to maintain a cash balance and the dealer to collect client paid fees from the cash balance without the dealer having to sell any of the mutual fund positions in the account to cover the fee. It also enables the dealer to automate the collection of the client's accrued fees part way through a month based on the client's transactions through the cash position (e.g. - a full redemption of all fund positions in the account).

The challenge is that many dealers, including Investors Group, currently administer a large proportion of their clients' mutual fund positions in client name accounts. Today, approximately 95% of Investors Group's 1.65 million accounts are held in client name. Therefore, the transition to a direct-pay model would require us moving essentially all of our clients' fund positions to a series that can be held in a direct-pay account, and possibly moving the positions from a client name account to a nominee account.

The recent changes that the industry has implemented as a result of POS and CRM2 serve as a good starting point with respect to the extent to which systems, procedural and educational enhancements and updates will be needed to effectively transition all clients to direct-pay arrangements. We found the CRM2 requirements in particular to be very complex and requiring significant time and expense to implement. These changes involved obtaining accurate and complete data at a detailed level that was not always readily available, analyzing the data to categorize the transactions and fee types, and building new functionality in our systems. Gathering the data proved more difficult when it resided in a vendor's system.

The costs and complexities associated with these changes were significant. We estimate that the cost to discontinue embedded commissions and transition towards a direct-pay model would be several multiples more of this amount. We anticipate that the time and costs that will be incurred to effectively implement a transition to direct-pay arrangements will directly impact our ability to engage our people and energies in investing in digital services and technologies to improve the client experience. While we are confident that we could transition our clients effectively, our concern is that for smaller independent dealers and investment fund managers, the complexity and costs of transitioning their clients and business models to direct-pay arrangements will potentially create business viability concerns.

2) Transaction volumes, client reporting and administration expense

Discontinuing embedded commissions will likely increase the volume of fund transactions in clients' accounts due to more fund distributions to clients, the introduction of client fee transactions, and the likelihood of more fund redemption transactions to cover the client's direct-pay fees. From an operational perspective, volume increases could increase the costs of administering client accounts because of the systems resources required to process the higher volume and associated increased reporting of the transactions to clients.

3) Registered Accounts

Moving to direct-pay arrangements will also present some challenges to certain types of registered plans in a client account. We would encourage the CSA to consider exempting these accounts should the CSA move forward with discontinuing embedded commissions.

a) RRIF / LIF Plans

   i) The minimum / maximum payment calculations will be impacted by the decrease of the account's market value due to the application of fees that will presumably be paid out of the investment.
   ii) The RRIF / LIF minimum payment is calculated based on the year end market value. If investment fund managers facilitate the payment of dealer compensation from the investor's fund investment, the application of the fees will decrease the year end market value and consequently the minimum in the following year.
   iii) The LIF maximum payment is also calculated based on the year end market value. Collecting dealer compensation by payments from the fund investment will decrease the year end market value and consequently the maximum in the following year.

b) RESP and RDSP Accounts

For investment fund managers to facilitate the collection of clients' payment of dealer compensation from the investor's fund investment, the deductions would need to be charged to the income portion, followed by the capital portion and subsequently the government incentive portion of the notional information.

Based on Investors Group's agreement with the Employment Social Development Canada, we would note that fees cannot be charged to the government incentive portion of the account. Therefore, the ability of the investment fund manager to facilitate direct-pay arrangements as a way to alleviate the concern that mass-market investors may be hesitant to pay directly for advice may not be as impactful as envisioned for these types of accounts.

4) Transitioning Clients

Current securities regulations require receipt of client approval for switches between mutual fund series, moving from a client name account to a nominee account, and moving to a direct-pay arrangement – all of which also require significant client communications and administration challenges and expense. Most significantly, these changes often are disruptive for clients. The opportunity for regulatory relief that would enable dealers to notify clients of these types of transitions instead of obtaining and administering client approvals could significantly simplify the process for dealers and investment fund managers to transition clients to direct-pay arrangements while minimizing client disruption.

The CSA proposes two alternatives for dealers to transition to a direct-pay arrangement over a three year time period. From both an operational perspective and to provide clients with the best possible transition experience, Investors Group believes the best approach should the CSA proceed with a ban on embedded commissions would be to set a defined transition period and deadline and allow dealers and investment fund managers to determine how best to manage the transition to meet such a deadline. A phased account method may not fit the particular circumstances of a client holding multiple account type, and may be very difficult to achieve without significant disruption to clients.

Adding to the transition challenge will be that many dealers rely on systems vendors in various capacities. These vendors may provide services to more than one dealer and there may be multiple impacts on them from the dealers they service. Vendor resource constraints may limit their ability to meet the needs of dealers within a short transition period.

Accordingly, Investors Group believes that a transition date of 36 months as proposed in the Consultation Paper may be too aggressive. We strongly recommend that if the CSA proceeds with a complete discontinuance of embedded commissions, there is a commitment by the CSA to seek feedback from stakeholders part way through the transition period, to assess and determine whether guidance and/or an extension will be needed to effect an orderly transition to direct-pay arrangements.

Appendix – The Value of Active Management

Overview

Active and passive management are both beneficial in helping investors reach their financial goals. Active managers have shown that they can add value where market inefficiency exists, while generating potential alpha by exploiting off-benchmark opportunities when appropriate. In constructing a well-conceived portfolio, investors should view investing from a total portfolio perspective and utilize active asset allocation strategies to add value.

Active managers subscribe to a common belief that markets are not perfectly efficient, which creates an opportunity for portfolio managers to exploit security mispricing and outperform the overall market. Passive managers, on the other hand, seek to replicate the return of a given market index.

Market efficiency describes the degree to which the price of securities reflects all public and non-public information (timeliness and interpretation). Hypothetically, if the capital markets were perfectly efficient, active managers on average would not outperform the markets as securities would already reflect their fundamental value. On the contrary, if markets could be described as inefficient, there would be many opportunities for active managers to identify and profit from mispriced securities and hence outperform the overall markets. In practice, capital market efficiency resides somewhere in between these two scenarios. Active management can add value to portfolio returns over a broad range of different asset classes.

Active management generally refers to an investing strategy whereby a portfolio manager makes specific investment decisions with the typical goal of outperforming an investment benchmark or index. Active management can have advantages over market capitalized indices - and more importantly - protecting investor wealth over full market cycles - particularly during market downturns.

Actively managing asset allocation enables investors to be focused on individual objectives beyond benchmarks and the short term. This is essential for aging investors as they move from wealth accumulation into decumulation, where the emphasis is on consistency and persistency of income. It is much more difficult for wealth levels to recover from an investment loss when capital is being liquidated in retirement.

To better protect investors' capital, active managers are able to purchase securities that are undervalued and sell securities that become overvalued. They are also able to minimize losses by avoiding troubled securities and overly concentrated sectors or regions. Many active investment strategies also have the ability to hedge currencies, buy put options to lessen drawdowns, retain cash to reduce volatility, and utilize other tools to minimize potential investment losses. Furthermore, actively managed funds are able to effectively diversify their assets by avoiding the limitations of the benchmark through the avoidance of security and sector overconcentration.

Challenges

Successful active management is by no means an easy task. By simple definition, and for the most part, it can be a “zero sum game” where the gains of one investor come at the expense of another. Vanguard Asset Management describes it as follows:

> “The concept of a zero-sum game starts with the understanding that at any one time, the holdings of all investors in a particular market make up that market. As a result, for every invested dollar that outperforms the total market over a given period, there must by definition be another dollar that underperforms. Another way of stating this is that the asset-weighted performance of all investors, both positive and negative, will equal the overall performance of the market.”

Writing in The Financial Times, Yves Choueifaty CEO of TOBAM noted an additional challenge:

> “By definition the average active manager cannot outperform the benchmark because the benchmark is determined by the sum of activity carried out by both active and passive managers. And because passive managers have no impact on the benchmark – they merely follow it – it is, in fact, the sum of all the bets taken by active managers that determines the benchmark. It is obvious that it is impossible for the average active manager to outperform (or underperform) the average active manager. The benchmark is, after all, the output of all the activities carried out by active managers”.

Investing in the index does not on its own however ensure a positive outcome. For example, over the 25 year period beginning in 1929, the S&P 500 index did not recover to its former high until 1954. Yet, considerable wealth was amassed during this period through effective trading of individual securities. As cited by the CMG Capital Management Group:

> “It’s a little-known but startling fact: The average buy-and-hold stock market investor spends 74% of his or her time recovering from cyclical downturns in the market (from 1900 – May 2015). We like to think of investment approaches as types of aircrafts. Passive investments are like hot air balloons. In favorable conditions, they can indeed carry passengers to their financial goals.
>
> Active investments, on the other hand, are like planes. When winds are fair, they, too, can carry you in the right direction. They also have the flexibility to maneuver through bad weather, protecting their passengers from harm and keeping them moving toward the destination”.

The relevance of these numbers gain even greater importance in the context of Deutsche Bank’s Bradley Jones whose analysis revealed that a portfolio comprised of 60% equities and 40% bonds produced negative real returns over a rolling ten year holding period for almost a quarter of a 111 year period in the US market commencing in 1900. This is perhaps even more pervasive in a low interest rate environment where negative returns have come into existence and depending upon global events, could become more prevalent.

With this in mind, arguably the ultimate goal and value of active management is to provide downside protection, with secondary consideration given to muting volatility and out performing in bull markets. MFS Investment Management stresses this importance in their piece, “There’s No Substitute for Skill”:

> “To outperform in falling markets, active managers must have differentiated risk management. It should be an important part of their investment process, rather than an overlay, using active security selection to view risk from multiple perspectives before adding a security to a portfolio. Through a strong risk framework, they must manage risk on several levels, from the security to the portfolio to the firm. Investors consider this capability a high priority.”

Opportunities

Russell Investments has stated:

> “Dynamic active management – the real-time management of portfolio exposures to specific factors, countries, sectors, or currencies – can be used to help to avoid downside risk in chosen asset allocations. With this kind of focus, active management works to help create a smoother ride that can help to keep investors from exiting the market at the worst possible time”.

Perhaps most importantly for the retail investor, Russell also singles out the importance of after-tax returns, for of all the costs incurred by an investor - be it trades, investment management, or advice, the greatest cost will be taxation.

> “As so many of us have heard over the years, ‘It’s not what an investor earns. It’s what they keep.’ Being active around after-tax returns is often an underappreciated way active managers can help to provide value to investors. Unlike index-based passive investing, active management can use an expanded toolkit to actively maximize after-tax returns. This includes active loss harvesting – potentially increasing the absolute return an investor sees. Active, by its very nature, strives to do better”.

For many managers active management employs innovative factor weightings to outperform market capitalized indices. Morgan Stanley identifies these new approaches as:

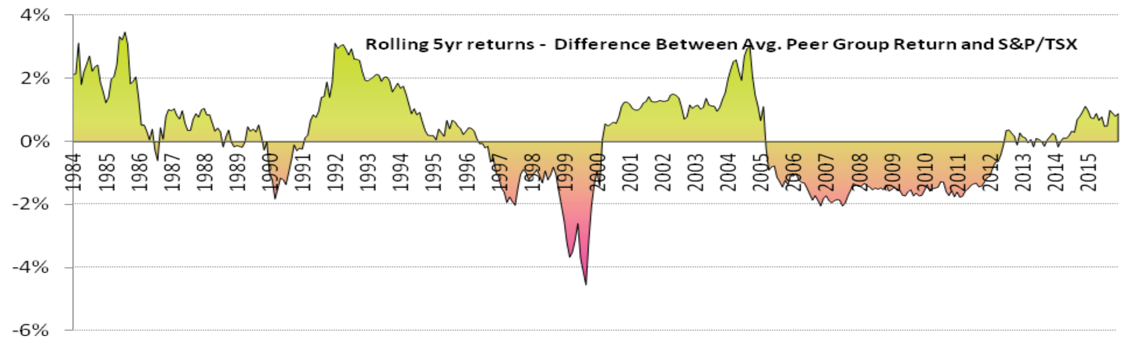
> “’Smart-beta’ strategies which attempt to replicate pure factor strategies (like value, momentum or low volatility) are the next evolution in the active/passive debate. While their systematic approach may be a low-cost replacement for some active managers, we still believe that 35 to 40% of the top managers add idiosyncratic alpha over long periods of time and thus their investment selections can be additive to diversified portfolios.”

Employing new approaches to challenge long held beliefs enables diverse opportunities for active managers**.** MIT’s Andrew Lo, well known for his paper, “Physics Envy May Be Hazardous to your Wealth!” (that demonstrated how the economic system developed by financial markets created a false sense of mathematical precision as the models developed were not as predictive as those used in physics) urges investors to view financial markets and institutions from the perspective of evolutionary biology rather than physics:

> “Markets are well behaved most of the time, but like any other human invention, they are not infallible and they can break down from time to time for understandable and predictable reasons”.

Analysis

According to data from Morningstar Canada, the average performance of the actively managed Canadian Equity peer group (Canadian Investment Funds Standards Committee (CIFSC) category) has exceeded that of the benchmark S&P/TSX index 58% of the time since 1980. Even more impressively, 1st quartile funds in the same category outperformed the index 79% of the time.



During each bear market since 1980, the benefits of active management have been quite evident as the average return of the CIFSC Canadian Equity peer group exceeded that of the passive index as can be seen in the following table.

Start	End	S&P/TSX Composite	25th Percentile Return	50th Percentile Return	Cdn. Equity Avg. Fund Return
Jun-81	Jun-82	-36.7	-26.7	-29.1	-30.8
Aug-87	Nov-87	-25.4	-20.8	-25.0	-24.1
Jan-90	Oct-90	-20.1	-10.5	-15.1	-12.8
May-98	Aug-98	-27.5	-23.7	-25.7	-25.5

Various studies and writings in recent years have pointed to the seeming inability of most actively managed funds to match or beat their index benchmarks. Most of these studies, however, looked only at average equity funds without making distinctions between those that were truly active and those that were not.

A more discriminating study in 2009 by Martijn Cremers and Antti Petajisto found that investment funds that were truly active, taking positions that significantly deviated from their benchmarks, were able to outperform those benchmark indices both before and after expenses.

Supporting Strong Capital Markets

Passive investment vehicles have low costs mainly because they do not do any of the research and trading that active managers do. Without this research and making prices informative, individual securities can become mispriced and markets distorted. According to Lasse Pedersen of AQR Capital Management:

> "If most investors were passive, the liquidity in individual securities not included in the index would vanish as investors would only trade the index. Securities could become severely mispriced. The collapse of liquidity and the lack of active management would make the process much less informative. When the secondary market is illiquid and uninformative, buying in the primary market becomes much riskier."

A lack of liquidity in the market is not an issue if you don't have to sell or buy immediately. Actively managed funds are not forced to liquidate securities to meet investors' needs as they usually maintain a cash reserve. This cash reserve also benefits active management strategies by allowing them to exploit the market when mispricing occurs. In fact, the more investors use ETFs and other passive strategies, the more opportunities are created for active managers and the larger those opportunities are.

A further benefit is that within the market, active managers can profit at the expense of passive strategies in assessing the value of an initial public offering (IPO). Pedersen continues:

> "Research has shown that IPO securities are, on average, sold at a discount relative to their price in the secondary market when the shares start trading on the exchange. Informed investors can buy the new shares cheaply and then sell some in the secondary market to other (passive) strategies at a premium. As a result, passive investors are not guaranteed the same IPO performance as the group of active investors since they trade at different prices and quantities."

In competing for outperformance, active managers seek relevant information, analyse it to determine value, and select securities accordingly. In the process, they help to set prices and provide trading liquidity. The efficient allocation of capital in our market-based economy relies on this mechanism. According to Nitin Mehta, managing director of the CFA Institute for Europe, the Middle East and Africa:

> "Passive investors are relative free riders, having to pay only the marginal cost of market participation as price takers, rather than the higher average cost for making fair prices and supporting the real economic purpose of financial markets".

Conclusion

Active and passive investments are both beneficial in helping investors reach their financial goals. Active managers have shown that they can add value where market inefficiency exists, while generating potential alpha by exploiting off-benchmark opportunities when appropriate. In constructing a well-conceived portfolio, investors need to view investing from total portfolio perspective and utilize active asset allocation strategies to add value.

Active managers have shown they have the ability to outperform the index and can be less volatile than the index during bear markets. They are able to avoid less attractive, slow growing companies and provide greater exposure to companies with superior valuations or growth potential. Equities are inherently risky and active strategies can diversify that risk by investing in stocks with lower correlations, and by underweighting sectors that are overly concentrated in the index.

Effective diversification is about maintaining the right balance of stocks, not simply owning a basket of the largest stocks. Active management does not aim to invest only in the largest companies nor look to match the weight of the best performing stocks in the index. Instead, the focus is on selecting the most fundamentally sound and profitable companies, as well as those that are not highly correlated and so can be expected to react differently to market events.

Given the many uncertainties that global capital markets present, investing in stocks and bonds has never been more challenging. Actively managing those risks is critical for those who depend on stocks to grow their wealth and bonds to add an element of stability to their investment portfolios.

Montréal, QC H4Z 1G3

Hello to all of you:

Thank you for allowing me the opportunity to comment on this consultation. I am an Advisor who has been licensed to sell insurance and mutual fund products for 19 years now. I earned my Certified Financial Planner Designation in 2005. I have a wide range of personal and business clients that I work with, in the small city of about 80,000 people where I live.

While I agree completely that client interests must be kept at the forefront at all times, I have several concerns with regard to your proposal, and in general with the direction that CSA policy has gone in the last 10 years. I will highlight these concerns below, and will make comments from my perspective. I will also pass on comments that I have received from my clients. I have spent a lot of time in client meetings discussing these potential changes with them and they do have opinions on it:

Embedded Compensation

This is simply a compensation structure. It is neither good nor bad and it seems short sighted that a Regulator would look at this as “a national problem”. There is nothing wrong with an Advisor being paid for the work they do. There is something wrong when the Advisor’s interests come first. THAT is the problem. But that will be a problem in any pay structure. How can you let Canadians believe that removing a compensation structure will make people behave better? Let me use an example you can easily understand. If a CSA or Securities Commission employee has the option to earn a bonus, they will certainly look at the requirements to earn it and will work towards those bonuses. This does not mean they are doing their job poorly. It simply means that they are working to their pay structure while doing their job to earn some extra pay. If the requirements to earn that bonus changed next year, they may change their work habits to earn that bonus…while still doing their job. Is this now a conflicted employee? They changed their behavior to make more money. This is human behavior. People want to get the most benefit for the work they do. It is part of who we are.

If you take away embedded compensation, you will simply expose Advisors and Consumers to another pay structure that inevitably will lead to the same questions. Someone will still do their best to make the most of their pay structure. You will never get away from it. Removing the embedded pay structure does not fix the human behavior problem which is the real heart of it all. This new policy will change nothing for Consumers from my point of view and falls very short of being a real solution for my clients.

What is the Problem?
There are symptoms of a problem. We hear of Investors who are victims of fraud. This not acceptable. Some Advisors run afoul of the regulatory rules, and should be punished. We hear that Advisors can make more money running their business one way or another at the expense of clients. But these are the symptoms of, and not the problem itself.

In my eyes, it is the behavior of Advisors *and* Investors that cause these problems. (yes, I include investors in this too.) People want things and will do what they have to, to get them. Advisors want to be paid. Clients want high returns with no risk or cost. Clients want Advisors to predict the future with 100% efficiency. These behaviors will never go away no matter what rules you put in force. I believe that removing the embedded compensation system will not make a difference to those behaviors. A 1% trailing commission is not what caused some elderly investor to be defrauded. It was poor behavior. An embedded fee did not get a client a -40% return because they took on more risk than they should have. The problem is behavior. So let’s fix that.

Embedded Fees are Hidden
I see in many other submissions that the fees are hidden. If only consumers could see them, it would change their lives! If only they could understand them! I don’t think this argument holds much water with the advent of CRM2. You may not understand how the fees work, but you can certainly see how much you are paying to your Advisor now. It shows a dollar value and those consumers who are confused must understand that. Have the conversation with your Advisor. Get value for the cost you are paying. It’s up to consumers on this point now. My clients get this. It is simple and I take the time to explain it to them.

At this point it doesn’t matter how the consumer pays. The amount that gets paid to a Dealer shows up on the statement, so this argument is passé, and in the future, should be disregarded completely. If you use an Advisor it will cost you something.

Fees eat away at retirement fortunes.
In many submissions, I hear that fees eat away at retirement fortunes and are unreasonable. I don't understand this. The fee that the lawyer charged me for the will he wrote ate away at my retirement fortune too. How about the car I buy? The groceries? Any product or service that is provided in this world comes with a sales/service cost.

Here is an example: Think of the fees I pay to my Regulators. Year after year, I pay these fees. I have no choice in what Regulator to choose. I can't negotiate the cost or the services I access. I have absolutely no say in the direction or creation of policy in the industry. It sounds like a pretty bad deal when you put it that way. It sounds like any fee increase to me could be perceived as a conflict of interest to the Regulator. And every dollar that leaves my pocket makes it harder for me to feed my family.

But if I want to be in this industry and get the benefits of a solid Canadian financial system, then I must pay. If I don't like it, I need to find another way to do my work or change careers.

Financial advice is the same. I am tired of hearing this argument from consumers. They have many options, and one of those options is to pay a professional advisor to help them. That help will cost you something. Typically it is 1%. The fee will be on your statement. If you don't like it, then you can try to renegotiate a lower fee, or you can save all of those fees and do it yourself. It sounds like many of the consumers out there think that the fees are too high. They are welcome to manage their finances anywhere they like. But if they think that Advisors will work for free, they will be disappointed.

CRM2 – Some great progress.
Let's focus on some good regulation that recently came from the CSA. The fact that the amount of compensation an Advisor's firm is paid is now disclosed on statements has changed everything for consumers. This is a good measure that allows Consumers the opportunity to weigh the value of what they get, for what they pay. **This, more than any other stroke of a pen the CSA can make, will force Advisors to be better and treat their clients the way they want to be treated.** It helps to guide behavior between the consumer and the Advisor **which seems to me to be the problem you want to correct.** I have had numerous conversations with clients in regards to this and not all of them were comfortable for me. The clients asked some hard questions, but in the end, my client and I either chose to work together or not. This is exactly what you were hoping for with CRM2. The CSA should let the ink dry on this initiative to see where the Advisor/Consumer relationship ends up. Don't go wildly down a path of eliminating pay structures that have little to no bearing on encouraging good behavior from advisors.

Clients are assumed to have no knowledge and are vulnerable.
While it is true that some clients are vulnerable, it is flawed on your part to think that consumers are completely helpless when it comes to investing. This is not the case and the idea that you are taking away choices in how my clients deal with me is not going over well. In my discussions with clients, every single one of them has said something along these lines: "Now that I know how much I am paying, why would they take away my choice in how I pay my Advisor? What

good does that do me? I'll decide the best way for me to work with an Advisor and how they deliver their service to me. If they can't deliver, I'll go somewhere else." This is exactly the kind of conversation that CRM2 was supposed to encourage. Will eliminating embedded compensation make that conversation better? I doubt it. It will just become another detailed conversation that will confuse consumers about their finances.

The idea that most consumers are vulnerable is overwhelmingly not the norm. Although many clients do not have finance as a hobby, they are successful business people who have taken post secondary education, bought houses and properties, made business deals, raised children and understand how business works. To create rules that limit how these people deal with Advisors is condescending to them and their intelligence. They don't get this type of paternalistic treatment in any other area of their financial lives. My clients demand a choice. You are taking it away from them.

You rule to the lowest common denominator in all areas.
I am not sure where your policy ideas originate from, but I can tell you the direction that they always end up going. They end up punishing every Advisor in this nation with a minutiae of rules and paperwork. It forces unwanted disclosure on clients. It creates a system of boxes and forms that cannot be filled out properly and for the most part does not help consumers understand finances better or reach their goals. This new proposal will simply add another layer of disclosure to an already bloated meeting agenda for Advisors and consumers.

Creating an outstanding number of rules will not solve the problem of keeping consumer interests first, or make Advisors behave better.

CSA policies already are excluding smaller investors from quality advice. This policy will only make this worse.
I can only cite anecdotal evidence from my book of business, but I have discussed this with many advisors from many different companies including banks. The trend in the last 2-3 years has been to increase minimum account sizes. The cost of compliance and disclosure has forced most Dealers and Advisors to focus on their large clients. Smaller clients are "encouraged" to go elsewhere. I can't afford to take care of smaller clients at a price they can afford because of the gigantic compliance burden that is thrust upon us.

Here is the problem for society if this continues forward: My block of business works this way: I need small clients to grow to become larger clients. Aging clients eventually pass away and must be replaced. If I don't have smaller clients growing into my block to replace them, eventually I will go out of business. This proposal will eventually exclude all small clients from accessing advice and will also prevent new advisors from joining the industry as they typically start with smaller clients. As that spiral continues, the advice channel disappears and Canadians are left to manage the complex tax, investment and financial world in Canada on their own.

Check what the account minimum size is now with a broker at a major bank. You will be surprised at the size of client you need to be to get their help. If these trends continue, the CSA may need to offer courses on financial literacy to make up for this gap! My 19 years experience in this industry tells me that most consumers cannot wade through the complex landscape of financial acronyms without any help from a professional?

You seem out of touch with what my clients want.
When I discuss the potential ban on embedded compensation with my clients, they overwhelmingly state that they don't see how this will help me give better advice to them. Why should their ability to choose how they deal with me be limited? Regardless of how many rules you make or change, clients will either trust an Advisor and work with them…or not. Shouldn't they be able to look at the numbers, discuss my services to them and agree on the best way to proceed? It seems closeminded to imply that all clients would want to do business the same way and your proposals are forcing consumers down a path where there will eventually only be one way.

My clients want to deal with a professional that will build a long-term relationship with them. They want to be educated about finance, and to trust the advice and professionalism that their Advisor provides to them. They do not want to become financial advisors themselves. That is what they want us to do for them. If we meet their needs, they will choose how they deal with me and how I get paid. Your proposals are making it harder and harder for the Advisor/Consumer relationship to continue.

Some general comments for the direction of policy in the future – which applies to this consultation as well:

No advisor input.
It baffles me that a Regulator that regulates Advisors, that has so many financial resources, would not jump at an opportunity to include Advisors in policy development. It actually offends me that we are not included. I am making an effort to reach out with this letter because I think this is important for my clients.

Where are the Advisors on your board of directors, policy boards and outreach panels? Do you even have groups like this? Perhaps Advisors who actually deal with consumers on a day to day basis would have some great ideas on how you could solve some of the problems you have identified. I find it hard to believe that you have repeatedly excluded Advisors from this process and feel that as a Regulator, it is your duty to be inclusive of all groups you represent. Put another way, you would be doing your job better if you used all of the resources that are at hand. The Advisor community is an excellent resource. Please consider using it in the future.

No input from Consumers. Is there a real problem for Canadians in regards to embedded commissions?
When I discussed this proposal with my clients, 100% of them were completely unaware of it's existence. It is pretty hard for a consumer to comment on this process when they don't know it is happening. This is a serious issue and part of your responsibility as a Regulator. If this is such a major issue, why are clients not aware of it? Why are they not concerned? Why am *I* bringing it up to them in my meetings and not the other way around? I have two potential answers to those

questions: You have done a poor job of promoting and educating people on what you are doing, and/or people aren't nearly as concerned as you imply they are. Maybe this is not an issue with the public? I find it VERY hard to believe that out of all of the clients that I brought this up with that none of them had any real knowledge of the problem. I took the time to explain it to them and they were still not worried about it when they left my office. It makes it seem like this is complete overkill and is not really going to help Canadians at all.

You may defend yourselves and say that you have done a good job in educating Canadians and given them every opportunity to participate. But look at the process for comments. Your document is 100+ pages long! It takes a special consumer to read through this and put in the time to craft a response! I applaud those that did it. This process excludes ordinary consumers and even Advisors by it's sheer volume and complexity. None of my clients are willing to go through that process to defend their financial future against something they aren't concerned with. ***At the end of the day, Millions of Canadians will be surprised by an industry change if you go ahead with these proposals.***

Advisors can't keep up to the pace of regulation and change.
Overwhelmingly, Advisor colleagues tell me that they cannot keep up with the pace of Regulatory change. You have created a cottage industry of rule making without waiting to see if the last rules you put in force worked. If you gave the industry some time to catch up and implement the changes you wanted, you might see that many new potential policies would not be needed. For the most part, Advisors are out there doing their best. They are truly helping clients. They are trying to improve and be better. But at this point in time most Advisors are frozen in fear to complete a form incorrectly, or have the wrong size font on their business card. This regulatory whirlwind does not help to improve our industry when Advisors and clients can't keep up or understand what is changing. Advisors should be helping their clients. Piling more regulation on top of regulation will not create a good environment for Canadian consumers.

A solution is waiting for you…Increasing Advisor Professionalism

A Financial Advisor Profession
If you increased the professionalism of Advisors, it would solve many of your problems. As a member of Advocis and the FPSC, I am bound by a code of ethics that puts client's interest first at all times. With this as a guide, I see many of the regulations forced on the industry by Securities Commissions as redundant. I don't need to have each minute situation guided by a different rule. I have one overarching rule that guides me through all of the minutiae in a day. It's easy for me, and the largest number of Advisors follow this already.

These organizations (Advocis & FPSC) have a professional solution in place already and they just need to be included in your policy development to make them even more relevant to Canadians. If we can find a way to guide the ethics of Advisors, the other small issues simply become details. I strongly encourage you to reach out to these groups and see what they have to offer to make our industry better. **Making Financial Advisors a profession, will create better advisors, provide a more streamlined approach to regulation and most importantly will**

provide a great boost to consumer confidence, literacy and outcomes. If you can accomplish this you will have helped Canadians and our industry to be better.

Thank you again for the opportunity. Please feel free to contact me if you have any questions.

Dear Sirs/Mesdames:

Re: CSA Consultation Paper 81-408 *Consultation on the Option of Discontinuing Embedded Commissions* - Comments of the Investment Management and Securities Litigation Groups of Borden Ladner Gervais LLP

We are lawyers in the Investment Management and Securities Litigation practice groups of Borden Ladner Gervais LLP and are writing this letter to the Canadian Securities Administrators to provide our collective comments on the above-noted Consultation Paper. We provided our comments to the CSA on the CSA's December 2012 Discussion Paper on mutual fund fees, as we have done on virtually every consultation and rule proposal that has affected the investment fund and asset management industry for the past 20+ years.

BLG has been privileged to work with many managers of mutual funds and other investment funds operating in Canada and internationally for over 50 years. We have assisted in the structuring and establishment of hundreds, if not thousands, of mutual funds, and other types of investment funds. As such, we have seen first-hand the huge growth in the investment funds industry – not only in terms of its increased importance for investors, but also the heightened sophistication of strategies, features and services associated with the various funds. We have also seen the significant rise in regulation and regulatory focus on investment funds. We often assist in industry initiatives, including those organized by The Investment Funds Institute of Canada (IFIC), the Portfolio Management Association of Canada (PMAC), and the Investment Industry Association of Canada (IIAC). Our lawyers participated in the working group that formulated IFIC's comment letter on the Consultation Paper, as we did with the 2012 Discussion Paper.

We have also been privileged to work with many registered dealers (members of the MFDA and members of IIROC) and with many advisors, and understand their business models and successes, as well as the pressures (regulatory and operational) facing them in their work with Canadian investors to assist those investors to meet their financial objectives.

We considered both the 2012 Discussion Paper and this Consultation Paper with interest and commend the CSA for their thoughtful review of the policy issues the CSA see with the current fee structuring models – and for their significant attempts to back up their positions with evidence and research, particularly with this Consultation Paper. It is clear that much thought, resources, research and analysis have gone into this Consultation Paper and for this reason we wish to clarify that, although we do not agree with the CSA's proposals (for the reasons we outline below), we do recognize the CSA's extensive efforts and the importance of the issues raised in this Consultation Paper for investors – and also for the financial services industry.

It is in this spirit and with this background that we provide the CSA with our collective comments and thoughts on the Consultation Paper. Our comments should not be taken as the views of BLG, other lawyers at BLG or our clients.

Fundamentally our comments on the Consultation Paper have not materially changed from our earlier comments on the December 2012 Discussion Paper. We do not consider that the CSA have made a case for banning "embedded commissions" and we consider that the propositions put forward in the Consultation Paper may do more harm than good not only to investors, but also to participants in the Canadian asset management industry. In our view, the CSA's conclusion that banning embedded commissions, and requiring the industry to adopt other fee models, will have an overall positive, better result for investors, is ultimately unsupported by 'hard' evidence.

In addition, we urge the CSA to:

1. Consider the implications of the proposals put forward in the Consultation Paper on all facets of the industry – as we discuss below, the CSA has not considered important elements of the asset management industry or SRO regulation, as it relates to the overall fees discussion, which we consider problematic.

2. Consider carefully all comments received on the Consultation Paper, notwithstanding those comments may not raise "new arguments" or may not be "fact" or may not be supported by evidence. The onus should not be on the

industry to refute CSA opinions and views with "evidence" – the industry's views and opinions based on participants' own extensive experience with the needs and preferences of investors, provided by way of commentary on the Consultation Paper should be considered just as carefully as the CSA considers its own views and opinions.

3. Carefully tie together all of the regulatory initiatives undertaken over the past 10 years into a holistic package – with a unifying message and clear coherent regulatory goals and principles, along with a more creative, less prescriptive approach to regulating the industry. We provide more commentary on this below.

Our comments on the Consultation Paper follow (each of which elaborates on the above-noted fundamental comments).

1. Commentary on the Overall Underlying Premises of the Consultation Paper

Underlying the Consultation Paper is the deeply held assumption (and regulatory conviction) that embedded compensation is "bad" and that other forms of compensation arrangements would be much better for investors and industry participants. However, when one looks at trailer fees (leaving aside, for the moment, DSC (including low load) arrangements), it is clear that trailer fees are merely a packaging alternative to having an advisory fee paid apart from the management fees and expenses indirectly borne by the investors in the fund. In many instances, the current fee structure where trailer fees are paid by fund managers out of the revenue generated from the funds provides a simple, "all-in" cost to the investor.

In the Consultation Paper, a great deal is made of the following:

- investors are said to be not fully aware of the embedded compensation; and
- if investors paid for advice outside of the fund, they would be more aware of the fee and, as a result, have bargaining rights, including more control over the fees they pay.

Yet the Consultation Paper provides no real evidence of this correlation.

We find it very disheartening that after requiring industry participants (fund managers and dealers) to spend literally hundreds of millions of dollars to comply with pre-sale Fund Facts delivery and CRM2 disclosure obligations, the CSA members are quick to conclude that these measures do not – and indeed cannot - adequately inform an investor who cares to equip herself with the knowledge of the cost of her investment and who performs which service for the investor. The reality is that many investors will not take the time to read these documents – and only focus on "the bottom line", which is not to say that these documents are not useful and should be discounted. Arguably, with embedded compensation that "bottom line" is easier for the investor to understand as they see performance of the fund, after deduction of fees. The Fund Facts and CRM2 initiatives are still in their infancy, and, therefore, we firmly consider that it is premature to reach definitive conclusions on their ability to explain how the embedded compensation model works and impacts the investor's investment outcome.

If the CSA believe investors will not really read and understand the documents they will receive under Fund Facts (pre-trade delivery) and CRM2, why will they be any better off in a fee-based or direct pay account? There is no evidence or factual basis for any assertion that the fact that investors are paying an account level or direct pay fee will be any better understood at the time of payment or account opening, or on an ongoing basis. Arguably, investors will be worse off as they may be inclined to focus only on the fund performance, which naturally looks better when one moves the dealer compensation outside of the fund. While on page 78 of the Consultation Report the CSA address the potential inconvenience of the separate fee payment, there is no real discussion about how this fee will appear on account statements or in the presentation of fund performance, and how these presentations and fee payments would create a tangible positive difference in investor understanding.

No evidence has been provided to suggest that the average retail investor would have any ability to negotiate the fee that they would pay for advice in a fee-based account or in a direct pay scenario, which is one of the other key assumptions underlying the Consultation Paper. Indeed, in its Report, the Brondesbury Group expressly concludes "no empirical studies have been done to document whether investors have greater after-fee investment returns with fee-based compensation instead of commission-based compensation" (page 20) and that "some experience in jurisdictions that have banned commissions suggests that the net benefit for investors remains elusive" (page 20). In our experience, fee-based accounts for smaller account sizes are not typically negotiable and can be higher than embedded commissions, especially in the case of investments in bond and fixed income funds.

This point seems to be lost in the Consultation Paper, which instead focuses only on quoting the "obvious conclusion" from the Brondesbury Group report – that embedded compensation negatively impacts performance when compared to funds without embedded compensation. This suggests that the CSA may not have given sufficient weight to the different, and simpler, packaging argument. When one considers banning or restricting one alternative, it is critical to have fully compared it to the other likely alternatives. In our view, a complete analysis is missing from the Consultation Paper.

Also, if the "sticker shock" of seeing the dealer fee broken out in the manner contemplated in the Consultation Paper were to cause investors to cease to invest or to pursue other investment options which offer less advice, it is an open question whether this would be beneficial to the average investor – many of whom are by their nature not "do-it-yourself" investors with the resources or financial literacy (not to mention inclination to go it alone) to produce superior investment outcomes.

In addition, the Consultation Report does not provide many details to support the "bias" argument - that is, representatives of dealers provided biased advice based on compensation alone. In our experience, trailing commissions are fairly standardized across the industry, with many of the exceptions which existed in the past having disappeared in response to market competition and unfavourable perception pressures.

We also note that the Consultation Paper makes much of the lack of description of what services the investor receives in return for his/her indirect absorption of trailer fees and whether investors get services of commensurate value, but does not question whether the same would be true for other alternatives of direct payment for distribution services by investors.

The Consultation Paper indicates that the embedded compensation structure results in cross-subsidization, with the suggestion that this is a negative. Investment funds, by their nature, involve elements of cross-subsidization and that as fund structures evolve, the level of cross-subsidization is diminishing. We would suggest that fee-based accounts are also subject to cross-subsidization. Just like funds with embedded compensation where, until one crosses a particular threshold, the investor is paying the same fees as investors with less (and potentially considerably less) money, investors in fee-based accounts are also subject to pricing that only changes at certain break points.

To suggest that a retail investor, armed with the knowledge that they are paying an account-based or direct-pay fee, will suddenly have much better control over the fee they pay strikes us as unrealistic and, at the very least, not backed by any empirical evidence. There is no reason to believe the smaller investor will have any negotiating power to lower his or her fees. If they are put off by the "cost" of advice they may gravitate towards "no advice" or very generic advice options which offer less investor protection (and potentially less ability to meet investment objectives) for those who need it most.

At page 80 of the Consultation Paper, the CSA acknowledges the very real possibility of product arbitrage. In our view, if the CSA conclude significant changes must be implemented we submit these should only be made once this product arbitrage issue has been addressed. Failure to do so may well leave investors with a worse possible outcome in the longer term.

We believe it would be completely unreasonable to eliminate the right to collect redemption fees payable under DSC arrangements that were entered into in good faith by fund companies and investors prior to the announcement any new rules as is suggested as a possible outcome on page 82 of the Consultation Paper. This would interfere with contractual arrangements that were entered into in good faith and fail to recognize the funding obligations of the fund companies which are inherent in offering an investor the option of having all of the investor's money invested without the payment of a front-end commission.

2. Assumption that Embedded Compensation Creates an Insurmountable Conflict of Interest – Fact? Or CSA Assumption? Implications of Such Assumption

The Consultation Paper discusses conflicts of interest resulting from embedded commissions; more specifically, it states embedded commissions create a conflict of interest that misaligns the interests of investment fund managers, dealers and representatives with those of the investors they represent. This deviation in interest, changes the behaviors of said fund managers, dealers and representatives at the "expense of the market efficiency and investor interests." (page 11) Thus, the CSA proposes that embedded commissions should be avoided [that is, prohibited] in favour of different compensation structures.

In the context of registrants, the CSA explain in the Companion Policy to NI 31-103 (section 13.4) that a registered firm must identify conflicts that should be avoided, determine the level of risk that a conflict of interest raises and respond appropriately to the conflicts of interest. The CSA also outline three methods to respond to conflicts of interests, namely, avoidance, control and disclosure.

Specifically, in the area of avoidance, the CSA state that if a registrant allows a serious conflict of interest to continue, there will be a high risk of harm to clients or to the market. If the risk of harming a client or the integrity of the markets is too high, the conflict needs to be avoided. Registrants must avoid all conflicts of interest that are prohibited by law. If a conflict of interest is not prohibited by law, registrants should avoid the conflict if it is sufficiently contrary to the interests of a client that there can be no other reasonable response.

Accordingly, the guidance suggests that avoidance as a means of response to a conflict of interest is required where “there is a high risk of harm to clients or the markets”, where the conflict is prohibited by law or where the conflict is “sufficiently contrary to the interest of the client that there can be no other reasonable response”.

In our view, the Consultation Paper does not apply the aforementioned tests to the conflict of interest presented by embedded commissions, which makes it difficult to understand the basis for the CSA’s position that conflicts of interest related to embedded commissions should be responded to by compulsory avoidance.

The CSA outline different potential negative impacts of embedded commissions on the market, without any analysis linking those negative impacts to a high risk of harm to clients or the integrity of the markets.

In particular, we are concerned that in failing to apply their own tests for avoidance of conflicts of interest as described in section 13.4 of NI 31-103CP, the CSA are, in effect, changing the tests and guidance in this respect. We submit that if the tests or guidance on when a conflict of interest must be avoided are changing, this needs to be clearly articulated to the market and in particular, to registered firms. Also, it needs to be articulated in a way that allows registered firms sufficient time to identify such conflicts and restructure their systems and affairs to implement an avoidance response to manage such conflicts of interest. However, we feel this approach would be misguided, given that we continue to consider that disclosure is the best option to moderate this potential conflict of interest.

Finally, the Consultation Paper discusses perceived conflicts of interest resulting from the commission structures at both the level of the fund manager and the dealer/representatives.

While it may be accurate to suggest that conflicts of interest exist for fund managers (in theory), that is, fund managers have a profit motive (more assets in funds equals more management fees), which causes them to incent dealers to distribute their mutual funds, we do not consider that a case has been made by the CSA that this conflict is at odds with the fund managers’ duty to act honestly, in good faith and in the best interests of the mutual funds, as required under securities legislation. It is only when the conflict is elevated to this level that securities legislation requires consideration of the conflict of interest by an independent review committee of the mutual funds (IRC) under National Instrument 81-107. We are not aware of prevailing industry practices – or any earlier position of the CSA – that would suggest fund managers should refer trailing commissions or incentives paid to dealers to the IRC of the funds for a recommendation. In our view, the CSA regulate this area in ways that moderate the most obvious conflicts of interest for fund managers through National Instrument 81-105. It would only be if the CSA considered that NI 81-105 did not operate to deal with the conflicts inherent in a commission-based industry, that further action would be necessary. We do not consider that simply paying commissions for distribution services means that the fund manager is acting without regard to its fundamental duty of care towards its mutual funds. We find particularly tenuous (and an example of an opinion being stated as a fact by the CSA) the assertion made throughout the Consultation Paper that mutual fund managers are more reliant on compensation and incentives paid to dealers to gather in assets than performance. In other words, performance is less important to fund managers than paying dealers to sell their funds according to the CSA, which assertion is not supported by evidence and our experience of working for many years with fund managers.

We understand that commissions and incentives may create conflicts of interest at the dealer and advisor level, which may lead (theoretically) to mis-selling of mutual funds (recommendations for mutual funds based solely on the compensation that the dealer/advisor will receive). However, again these conflicts have been regulated, since 1998 by NI 81-105 and through written and oral disclosure (enhanced as it is by CRM), as well as regulatory and legal standards of conduct on advisors and the dealer firms, who have extensive compliance monitoring obligations, including suitability requirements and supervision. The CSA explain that recommendations to investors by advisors cannot be made primarily on the basis of the compensation that the advisor will receive. We consider that this is an area where further discussions by the CSA with the SROs and their members may be useful. We comment on SRO regulation further below.

3. Continued Reliance on Clear Disclosure is Preferable to a Ban on Embedded Commissions

In our view, the recently implemented regulatory initiatives of pre-trade fund facts disclosure and the client relationship model initiatives should not be dismissed as effective mechanisms to alleviate the concerns noted in the Consultation Paper. We are firm in our view that the CSA should continue to monitor the impact of these initiatives before proceeding with a rule to ban embedded commissions. The increase in investor awareness that has the potential to result from these initiatives will allow investors to better assess the conflicts posed by embedded commissions (assuming they exist) and better evaluate whether the benefits of the services provided by their dealing representatives outweigh the costs. If these documents are considered to be deficient in some way by the CSA, we ask (as noted above) why the industry was required to implement these proposals with the degree of prescriptiveness and precision inherent in the proposals. If these documents and the delivery mechanisms to investors are deficient, then we urge the CSA to explain why – and undertake a serious rethinking of the nature of disclosure and the myriad of disclosure requirements that exist in current securities regulation.

The notion that investors should be given the freedom to make their own investment decisions, provided that they have access to all relevant information, is a fundamental – and long-standing - tenet of securities regulation. As a general principle, the purpose of disclosure in securities law is to promote equality of opportunity and information for all investors in the market. The CSA have relied on this principle in crafting regulation that requires timely disclosure by the issuers, advisers and distributors of financial products in instances of material change, knowledge asymmetries and conflicts of interests. Disclosure of relevant facts is intended to allow the investor, when apprised of such disclosed information, to make reasonably informed investment decisions on a level playing field with other participants in the market. We find it concerning that the CSA state (as they do throughout the Consultation Paper) that disclosure is now not sufficient and will never be able to work to mitigate any conflicts of interest – at least not ones similar to the conflicts of interest that the CSA consider are inherent in embedded commissions.

The Consultation Paper suggests that the implementation of point of sale disclosure and CRM initiatives will not address the inherent conflict of interests posed by embedded commissions, which, the CSA argue, incent dealing representatives to recommend products that maximize their revenue and incent investment fund managers to compete for sales on the basis of compensation they pay dealers, rather than performance. The implication of the Consultation Paper is that the conflict of interest posed by embedded commissions is so great that even disclosure of those conflicts does not provide investors with sufficient protection and that avoiding the conflict entirely is the only viable option.

There are several instances outside the context of embedded compensation in which conflicts arise between a registrant and its client where the CSA has long agreed that relying on disclosure to provide investors with sufficient protection. For example, a dealing representative that enters into an arrangement to pay for client referrals must disclose such arrangement to any client so referred. The purpose behind this disclosure is to alert the client that the referring individual was compensated for making such referral so that the client may take that fact into account when evaluating the merits of the representative's services and recommendations. Further, a registered firm that makes a recommendation to a client to buy a security issued by a related issuer must disclose the nature and extent of the relationship between the firm and the issuer. The purpose behind this disclosure is to alert the client that the registered firm has a relationship with the issuer that may influence the registered firm's recommendation. This disclosure provides the client with an opportunity to take that fact into account when weighing the potential benefits of making the investment against the potential risk posed by the conflict.

These disclosure requirements, amongst others, recognize that conflicts of interest may exist between more sophisticated financial services participants and clients who rely on those firms. For the sake and necessity of efficiency in the capital markets and providing investors with broad investment opportunities, instead of mandating that these conflicts be avoided, these rules require that conflicts are disclosed so that the investor can determine whether the cost or risk (i.e. the potential that the registrant may put its interest before that of the investor) is reasonable for achieving a desired outcome.

There are, of course, instances where the CSA has determined that a conflict is only appropriately mitigated when avoided. Conflicts must be avoided by operation of section 13.4 of NI 31-103 where they are prohibited by law or if the conflict is "sufficiently contrary to the interests of a client that there can be no other reasonable response". This is a high threshold, and in our experience these examples arise when there is a true risk of self-dealing to the strong potential detriment of the client. We submit that the conflicts of interest identified in the Consultation Paper relating to embedded compensation do not rise to this high threshold.

Like the examples set out above, point of sale disclosure and the CRM initiatives provide investors with fulsome disclosure of the costs and potential conflicts that arise when investing, as well as the potential benefits of such investment, so that investors may make a relative assessment of the risks and potential rewards. It is useful to reiterate the cost and performance data that are disclosed to clients at each stage of their investment:

Point of Sale: The CSA notes that fund facts aim to improve fee transparency by disclosing the costs of buying, owning and selling mutual funds. A fund facts document delivered at the point of sale discloses:

- Sales charges at the time of purchase
- Deferred sales charges at the time of redemption
- Trailing commissions paid to the dealer by the investment fund manager
- Management expense ratio
- Trading expenses ratio
- Total fund expenses

In addition to fee transparency, the fund facts document also provides data on performance of a fund, including:

- Annual total return of a series for either the past 10 years or since the series' inception (whichever is less)
- The best and worst returns for the series in a three month period over either the past 10 years or since the series' inception (whichever is less)
- The value of a hypothetical $1000 investment in the fund over either the past 10 years or since the series' inception (whichever is less)
- The annual compounded rate of return that equates the hypothetical $1000 investment to the final value

The fund facts document allows investors to get a sense of the initial and ongoing costs of investing in a fund and the potential risk and reward of the investment (based on historical data).

CRM2: CRM2 introduced new disclosure requirements relating to investment performance at the account level and the commissions and other amounts paid to dealers:

- **Account Opening:** Investors receive information on charges they may expect to pay in connection with their investment. If they invest in a fund, this information should include:
  - The management fee
  - The initial sales charge and DSC options available to the client
  - Any trailing commission or other embedded fee
- **After a Trade:** Following a transaction, investors are provided with a trade confirmation that discloses each transaction charge, deferred sales charge or other charge applying to the transaction, and the total amount of all charges.

- **Annually:** Annual reports now provide a summary of all charges incurred by the client and all compensation received by the dealer, including:
    - Total dollar amount of transaction charges
    - Total dollar amount of each type of payment other than a trailing commission made to the dealer or its representatives by another registrant in relation to registerable services provided to the client, which would cover upfront commissions investment fund managers pay to dealers for sales made under deferred sales charge arrangements
    - Total dollar amount of trailing commissions received by the dealer in connection with securities held

  The annual report also shows a detailed breakdown of performance, including the change in market value of the account, and the annualized total percentage return of the account for the last year, the last three years, the last five years and the last ten years.

All of the above disclosures aim to provide mutual fund investors with detail of the cost of investing and the performance of investments, at a product level (in the case of fund facts disclosure) and at an account level (in the case of CRM2). This increased awareness will allow investors to better understand the conflicts that may exist in an embedded fee structure and prepare them to evaluate these conflicts. Repeated disclosure about fees and compensation (at the time of account opening, at the time of investment, after investment, and annually) will allow investors to, over time, become more educated and informed about the fees they are paying. The CSA have stated that “increased performance reporting coupled with the increased saliency of fund costs and dealer compensation should cause investors to question the services provided by their representatives” who are in turn expected to respond by demonstrating their value proposition and reviewing the level of services provided. We submit that the CSA and industry should monitor how this process materializes before rejecting the effectiveness of these disclosures.

4. Commentary in the Consultation Paper does not sufficiently recognize the impact of SRO Regulation.

In our view, the CSA should consider very carefully SRO regulation of dealers and representatives before making the sweeping statements about whether or not trailing commissions and other incentives paid by fund managers create insurmountable bias and conflicts that requires embedded commissions to be banned. In our view, existing SRO regulation serves to moderate many of the issues noted as problematic by the CSA.

(a) Suitability should remain distinguished from and not confused with performance. Any discussion of performance should, in turn, include a full discussion of risk, its meaning and consequences.

The Consultation Paper states that embedded commissions raise conflicts of interest that misalign the interests of fund managers, dealers and representatives with those of investors in that it may:

- reduce the fund manager's focus on fund performance, which can lead to underperformance;
- give rise to compensation bias to incent dealers and representatives to recommend higher cost fund products that pay them higher embedded commissions other than other *suitable* lower cost and, preferably *better performing* products.

The Consultation Paper also states that investors may be caused to question the true costs and value of their services and that the CSA "… anticipate(s) that investment fund managers may respond to dealers' different product demands by producing lower-cost funds and focussing more on performance, thus potentially increasing competition and market efficiency" (p. 87). It says that there may be a "reduced incentive for products to be recommended on the basis of inducements received by the representative – potentially leading to a shift in recommendations from funds that were inappropriately favoured to *those that may be more suitable* for an investor. *If these funds are better performing funds, the shift in recommendations may reward better performing* investment fund managers with an increase in market share … (p. 90). Similar comments are made at page 93 of the Consultation Paper:

- "…. Dealers and representatives would specifically be required to consider the *impact of their compensation on performance as part of their suitability analysis*. To the extent that a product is recommended because it benefits the dealer or representative but there is an *equally suitable* product on the dealer's list that *would be less costly* for the client, such recommendation would not comply with the suitability obligation or the dealer's general duties to their client" ;
- "Combined with enhancements to KYC, KYP, suitability and proficiency, the CSA anticipate that representative recommendations *may shift to more suitable products* that may be lower cost possibly better performing products. To the extent that the CSA CP 33-404 proposals result in shifts in product recommendations *toward lower cost and better performing products,* we anticipate that these proposals may also have the indirect effect over time on investment fund managers as they may respond to these shifts by producing lower cost funds *and place greater emphasis on performance.* " .

We encourage the CSA to maintain concepts of suitability and performance distinct from one another as they may be easily confused in some instances, in particular those instances where investors have not enjoyed positive or more positive ("better") performance. Current legal and regulatory expectations in respect of suitability, as further described herein, require an in depth review of an investor's financial circumstances, investment objectives, risk tolerances, time horizon and investment knowledge. Performance does not form part of a suitability review. In other words, an investor may be suitably invested in every respect, while not having enjoyed positive or better performance or profitable investments. The lack of profitability or performance does not equate to a registrant failing to make a "suitable" recommendation.

Similarly, caution should be exercised so that a “more suitable” recommendation is not seen as a more profitable one or one that simply had lower fees. There may be multiple reasons for recommendation of one product over another to an investor, particularly where those products are not identical in all key regards, apart from fees, which may be one of a number of considerations.

Finally, any discussions regarding ‘better performance’ should be had in the context of a fulsome discussion of market risk and its various aspects and how that risk may be uniformly defined as amongst all members of the CSA, all SRO and all market participants, which uniform definition currently remains lacking. Such a discussion should also address the CSA’s underlying assumptions with respect to risk and the necessary role it plays as a tool in market investments.

(b) Regulatory policies should endorse the regulatory rules and expectations surrounding ongoing advice and recommendations which are not limited to trades but include recommendations to invest (and hold) over the longer term

The Consultation Paper states that the CSA believe investors do not receive ongoing advice from dealers and representatives that is commensurate with ongoing trailing commissions paid. In particular, it states as follows:

- “If investors are getting basic one time services centred *on the trade* as opposed to ongoing advice and services in exchange for ongoing embedded commissions paid out of their funds’ management fees, they may be indirectly paying too much for the services they are actually receiving. (p. 15)

- Moreover, since the aggregate amount of embedded commissions that investors pay increases as their holding period increases, those investors who remain invested longer may pay more fees than others for the same basic service. (p. 15)

- There is also the possibility that some representatives may have less of an incentive to service clients after the initial sale were we to move to more widespread use of fee-based arrangements. This may lead to “reverse churning”, in turn defined as when a dealer places a customer’s assets in a fee-based account (or receives some form of asset-based compensation) chiefly to collect the fee then subsequently does little for the client, in terms of actual advice, trading or account activity, in exchange for that fee. (p. 65)

- Embedded commissions will remain a ‘one-size-fits-all” fee that may not align well with the services and advice actually provided to individual investors in accordance with their specific needs, expectations and preferences’. This misalignment in turn, may cause investors to pay more fees than necessary relative to the services they receive, thus impending returns (p. 89).

- **…** there is currently no securities regulation that prescribes, or guidance that articulates, the specific services that an advisor is expected to provide in exchange for ongoing trailing commissions. Under N1-31-103…. Dealers/representatives are required to provide certain services at that time of the trade (eg. Suitability, know your client) but no requirement to provide ongoing advice focussed on the client’s portfolio (p. 122 Appendix A).

Somewhat similarly, IIROC Notice 17-0093 dated April 27, 2017 states in part as follows:

> *When asked by Dealers to justify this preferential payout for fee-based revenue, most said they believe fee-based accounts align registrant interests with client interests better than commission based accounts. While this may be true in some cases, there are other cases such as "buy and hold" where the client will be paying ongoing fees without receiving a commensurate level of ongoing service. Certain dealers also stated that, given the attention placed on embedded commission by the CSA, they are focussing on fee-based as the alternative.* (pp. 16, 24)

We consider these assumptions to be not supported in regulatory policy and industry practice.

Our regulatory regime has moved beyond obligations based solely upon a trade. Recommendations to buy and hold are encouraged and prudent for investors with a long term strategy and time horizon. Such recommendations do not imply a lack of duty on registrants and as such we cannot assume a lack of activity of their part in all instances.

IIROC Dealer Member Rule 1300.1 (p) to (r) provides that a suitability determination is required when an order is accepted, *when a recommendation is provided and when certain events occur* (as discussed further below). A recommendation to hold requires consideration of a client's current financial situation, investment knowledge, investment objectives and time horizon, risk tolerance and the account's current investment portfolio composition and risk level. In order to further comply with the requirements under Rules 1300.1 (p) to (r), due diligence must be used to ensure that the suitability of all positions in the client's account are reviewed and the client receives appropriate advice in response to the suitability review that has been conducted.

Under IIROC Rule 1300.1, a suitability analysis must also be performed when securities are received into a client's account by way of deposit or transfer, there is a change in registered representative or portfolio manager or there is a material change in the client's life circumstances or objectives that has resulted in revisions to the client's 'know your client' information as maintained by the dealer.

IIROC Notice No. 12-0109 dated March 26, 2012 provides that:

- all recommendations must be suitable to the client. Suitability of orders and recommendations need be considered based on factors included the client's current financial situation, investment knowledge, investment objectives and time horizon, risk tolerance and the account's current investment portfolio composition and risk level.

- the regulatory obligation to ensure that orders and recommendations are suitable includes not only an obligation to ensure that the specific investment product is suitable for the client but also the order type, trading strategy and method of financing the trade recommended and /or adopted are also suitable;

- the suitability analysis starts before the order is even received, recommended or executed; and

- good business practices encourage holistic suitability reviews which would include periodic suitability reviews of client accounts, suitability reviews of accounts that may be affected by significant market events and of accounts holding securities that have undergone a material change in risk profile.

IIROC Notice No. 12-0109 also provides that account information must be updated any time there is a material change in a client's circumstances and recommends annual contact with clients to verify the accuracy of account information.

Like IIROC Rule 1300.1, MFDA Rule 2.2.1 (c) provides that that each order accepted or recommendation made (including recommendations to borrow to invest) for any account is suitable for the client based on the essential facts relative to the client and any investments in the account. MFDA Rule 2.2. 1 (e) has the same trigger events for a suitability assessment as IIROC Rule 1300.1.

MFDA Bulletin MSN -0069 dated April 14, 2008 sets out guidance for maintaining accurate and complete KYC information, know your product and the suitability process, all of which are applicable to a hold recommendation.

All of the above-noted regulations are cited in support of the fact that there is much more to a "recommendation" to invest in an investment fund than is acknowledged by the CSA.

(c) Unsuitable Leverage Strategies are fully addressed by SRO standards, particularly by the MFDA

The Consultation Paper states that the CSA also believes the discontinuation of embedded commissions would also eliminate the incentive for representatives to potentially engage in unsuitable leverage strategies (as explained in Appendix A") (p. 70).

It is unclear from the Consultation Paper just how embedded commissions have proven to be a meaningful incentive for unsuitable leverage strategies. It is of note that the MFDA in particular has expended multiple efforts to ensure suitability of leverage, samples of which are found in their rules, policies and notices.

MFDA Rule 2.2.1(c) requires that recommendations to borrow to invest be suitable based on essential facts relative to the client and any investments in the account. MFDA Rule 2.2.1(f) provides that to ensure the suitability of the use of borrowing to invest is made whenever the client transfers assets purchased using borrowed funds into an account, whenever the dealer or adviser become aware of a material change in client information or there has been a change in the adviser responsible for the account and where the use of borrowed funds is determined to be unsuitable, the client is so advised and provided recommendations to address the inconsistency.

Part III of MFDA Policy No. 2 describes procedures for identifying and reviewing leveraged transactions and in particular, minimum criteria that require supervisory review and investigation including investment knowledge, age, time horizon and financial circumstances.

MFDA Bulletin MSN-0069, Suitability, sets out multiple responsibilities regarding leveraged transactions. It states in part as follows:

> Leverage is not suitable for all investors and the appropriateness of a recommendation to use leverage must be assessed on a client-by-client basis, having regard to the client's age, financial circumstances, objectives, risk tolerance, time horizon, the manner in which they intend to secure and repay their loan and any other factors that are known at the time or reasonably ascertainable and may be relevant in the circumstances.

MFDA Bulletin MSN-0069 provides further detailed guidance regarding Part III of MFDA Policy No. 2. In addition, MFDA Notice MSN 0074 dated May 19, 2010 sets out the MFDA's requirements for clear, plain language, leverage risk disclosure for investors.

(d) The practical needs and realities of an aging population should remain part of a frank discussion with both the CSA and the SROs and it is not a sufficient answer to ban embedded commissions

Finally, the Consultation Paper states that the CSA believes that embedded commissions incent unsuitable use of DSC arrangements and refer to MFDA Compliance Bulletin No. 0670-C, 2015 DSC Sweep Report, December 18, 2015, which uncovered instances of inappropriate use of DSC. The Consultation Paper points out that this included: "clients over the age 70 that were sold funds under DSC arrangements" and "clients that were sold funds with DSC redemption schedules that are longer than their investment time horizon" (p. 109).

We recommend that all regulators (particularly the MFDA) take a meaningful look at the life expectancies of Canadians and their personal and financial circumstances which are unique to every individual irrespective of age. For example, a 70 year old may well live for at least another decade or considerably longer. Irrespective of his or her lifespan, he or she may wish to have sufficient funds for estate planning goals. In other words, a long term time horizon may well apply and a DSC option may be suitable for that client.

IIROC Notice 16-0114 dated May 31, 2016 recognizes that senior clients are not a homogeneous group and that issues that affect some, may not be relevant to all older clients. Product due diligence, know your product and know your client are considered to be most relevant in this discussion. IIROC also points out (correctly, in our view):

> *While the presumption is that senior clients' time horizon is the duration of their retirement, senior clients may have differing time horizons for their accounts (eg. where a senior client wishes to leave a legacy to a family member). Dealer members should ensure that the rationale to support the time horizon used for each senior client is appropriately documented.*

Each of these regulatory requirements would require a representative to consider the appropriateness of DSC features for their older clients.

5. Effect of a Ban on Embedded Compensation on Investment Fund Managers

The Consultation Paper does not discuss the potential impact on fund managers, particularly new or niche fund managers, that a ban on embedded commissions may very likely have. Today, trailing commissions or other up front commissions paid by fund managers to dealers not only reimburse dealers for the distribution services they provide investors, but they are designed, in part, to also compensate dealers for the significant regulatory obligations relating to KYP and due diligence related to the funds they recommend to their clients. It would not be surprising to us if dealers were to narrow their shelf (particularly if the ban on embedded commissions were to be implemented alongside the "targeted" reforms discussed in the "Best Interest Standard" consultation paper) simply because the KYP and related due diligence were considered to be too onerous in connection with the investment funds managed by a new fund manager or a niche player or less well known fund manager. Furthermore, the elimination altogether of compensation from anyone other than the dealer's client could very well result in a further narrowing of the dealer's shelf, leaving only the most mundane of investment products, if there is no incentive or insufficient compensation for a dealer to invest the time necessary to do due diligence on, and assume the increasing regulatory risk of investing client money in, novel or alternative investment products.

We consider that this is a significant market-place issue that is deserving of consideration by the CSA. The ban on embedded compensation may have additional unintended consequences by reducing competition in the market-place and placing greater barriers to entry into the fund industry.

6. Missing Elements from the Consultation Paper

We point out several elements below that we consider to continue to be missing from the CSA's consideration of the issues around embedded compensation:

(a) The Consultation Paper does not discuss the tax considerations that are a key part of any discussion of investment funds, their fees and structuring. We urge the CSA to consider the tax aspects of their proposals before moving forward with them, if indeed this is the ultimate decision. We would be pleased to provide the CSA with any other information about taxation of investment funds and fees payable outside of the fund that the CSA might find helpful in this context.

(b) The Consultation Paper fails to acknowledge the CSA's regulation of mutual fund sales practices through National Instrument 81-105, which has been in place since 1998. This instrument contains rules that seek to moderate the conflicts of interest that are inherent in a commission, incentive-based distribution model. These rules also forbid fund managers to pay any money or incentives directly to dealing representatives (advisors). The CSA were very deliberate in its formulation of NI 81-105, including the extent to which the CSA would be willing to regulate specific incentive practices and commission levels. Any future CSA initiative in the area of mutual fund fees, must, in our view, include a consideration of NI 81-105, including any necessary reforms and updating of NI 81-105.

(c) The evolution of investment fund fees provided many *benefits* to investors, including considerations relating to changes in industry focus from front end load commissions to DSC to low load sales charges and also of investing in investment funds, generally, which include:

(i) With DSC and low load sales charges – 100 percent of the investor's cash is invested, whereas with front end load, particularly at the 8-9 percent levels in the mid-late 1980s, the commission comes out of the initial investment, meaning less money is actually invested in the funds.

(ii) With DSC and low load sales charges – if the investments are held for the prescribed period (which has shortened over the years), the investor pays no sales charges at all.

(iii) Front end load commission based sales can lead to more active trading in investment funds (which may result in churning of investments, being traded in order to maximize commission based income).

(iv) The desirability of investor choice – provided there is appropriate advice and suitability assessments (which is inherent in the distribution model of registered dealers and representatives), coupled with clear disclosure, we consider that allowing for market-driven alternatives is fundamentally preferable to a regulated reduction in the ways that fees for services can be paid for by investors. We do not consider that the Consultation Paper gives enough credence to the desirability of giving investors choices in how they pay fees for services.

(v) Investment funds give the average retail investor access to a professionally managed pooled vehicle managed by professional money managers and administrators for a comparatively low cost and at low investment thresholds. Investment funds are easily accessed by investors working through thousands of dealing representatives (including as part of a more holistic financial planning exercise) and hundreds of dealer firms. In our view, investment funds are a real Canadian success story, with access to funds being (generally) available in all of the provinces and territories of Canada.

(d) Related to the above-noted comment, with manager-established commission structures – that is, fund managers set the level and type of compensation that will be paid to dealers (and therefore indirectly to advisors) – the parties have more equal negotiating positions than would be the case if investors alone were left to negotiate their fees (on an individual basis) with their advisors and dealer firms. Fund managers have interests that are aligned with investors (including smaller retail investors) – they want investors to invest in their funds, they want their product to be competitively priced vis a vis other financial products (including other funds) and they are required to act in the best interests of the funds. Accordingly, fund managers wish to incent dealers to distribute their funds, while not paying more than is necessary to achieve this objective. Fund managers have much more "clout" and negotiating power than do individuals, particularly smaller retail investors. The CSA should carefully consider the potential for unintended consequences if the current tri-party bargaining relationship is replaced with a two-party model with clearly unequal bargaining power between the parties.

Related again to the two above-noted comments, dealers and fund managers can be said to have a somewhat symbiotic relationship. This relationship feeds the negotiating equality noted above, but also, in our view, led to the growth of the various compensation and incentive models discussed in the Consultation Paper and as regulated by NI 81-105. Because the majority of fund managers generally have no way to distribute their funds to the public (which is more of an operational rather than regulatory issue, given the tremendous operational, compliance and back-office operations that are necessary for a viable dealer network), fund managers must incent dealers to distribute their products, through commissions and other incentives, as well as good management, adoption of best practices and good performance. Similarly, dealers are dependent on fund managers to create and properly manage the funds that can be investment options for their clients. As noted above, the operational aspects that are necessary for a viable dealer network have costs which dealers, understandably, consider should be shared by fund managers through compensation and incentives, given the "sharing" of client relationships between dealers and fund managers. This relationship is a reality – but it is not inherently a negative reality, which is hinted at in the Consultation Paper.

7. Transition Issues Not Discussed in the Consultation Paper

The Consultation Paper does not discuss transition issues in the event that the CSA actually moves to ban embedded compensation. Would the CSA expect that managers will simply stop paying trailing commissions to dealers? Similarly, is the CSA expecting industry to create new series that do not include such embedded compensation and switch investors into that series?

Also, we note that insufficient attention has been paid to the fact that embedded compensation is 'embedded' in management fees -- a fund pays a management fee to its manager, who may then choose to share a part of that management fee with others, including dealers. Banning embedded commissions would not in and of itself change the quantum of the management fee charged by the manager to the fund. To the extent that managers choose to reduce the management fee charged to the fund in light of a ban on embedded compensation, it would not be reasonable to assume that the management fee would be reduced by exactly the amount of the current trailing commission.

Trailing commissions pay for service and advice that representatives and dealers provided to investors – we anticipate that managers may need to provide additional seminars and similar information sessions to assist with, for example, Know-Your-Product obligations because dealers may have less revenue to fund Know-Your-Product research to the extent they do now. Therefore, managers who wish to have a particular fund known to dealers, may need to hold information sessions to a greater extent than they would be required to do currently. Such sessions would need to be funded out of the only source of revenue available to managers – management fees.

Important transitional elements include the systems and operational changes dealers will have to adopt to provide for the ability to charge direct pay or fee-based account level fees. Fund managers will need to reconsider the series of funds they offer to the public. Significant time to allow for such implementation will be necessary.

If the CSA does decide to move forward with a ban on embedded commissions – it will be vital that the CSA carefully – and creatively – consider the transition for funds and industry participants alike. We recommend that the CSA hold a specific consultation on the transition that will be necessary, including recommendations as to modifications of the disclosure regime that today applies to funds, dealers and fund managers. A less prescriptive and inflexible – and more creative - approach to disclosure would be most welcomed.

8. CSA's Next Steps

Before moving ahead or taking any other steps regarding investment fund compensation, we urge the CSA to develop a holistic approach to regulating the industry – and to determine how each regulatory piece fits together at least at a high level. This would include an analysis of the considerable disclosure obligations on investment funds, managers and dealers and how these disclosure obligations fit with dealer and representatives' regulation (SRO and otherwise) and also regulation of conflicts of interest through NI 81-107, NI 31-103, NI 81-105 and NI 81-102, as well as existing securities legislation (Part 21 of the OSA, for instance). We consider that it is important not to focus so purely on the one element outlined in the Consultation Paper, being "embedded compensation through trailer fees and up front commissions" without considering other important matters that may give rise to similar conflicts of interest or important investor protection matters, such as charging of fees generally, operation and distribution of proprietary funds, revenue sharing, distribution of non-securities products (that do are not subject to the same regime as investment funds) etc, none of which are mentioned (other than to say they are not being discussed) in the Consultation Paper.

The Consultation Paper may raise important discussion points, but without understanding the balance of the regulatory regime and a complete picture of the entire industry, unintended consequences and unbalanced regulatory burdens will be created for different segments of the industry.

+++

We hope that our comments will be considered positively by the CSA and as helpful to advance the CSA's considerations of the important matters outlined in the Consultation Paper.

We would also be very pleased to organize a meeting with the lawyers who participated in the preparation of this comment letter to discuss our comments further with interested CSA staff if this would be considered useful.

The following lawyers participated in the development of this comment letter:

Whitney Bell, Jason Brooks, Rebecca Cowdery, Fred Enns, Kathryn Fuller, John Hall, Ron Kosonic, Lynn McGrade, Laura Paglia, Donna Spagnolo and Prema Thiele.

Yours very truly,

Borden Ladner Gervais LLP

(Investment Management and Securities Practice Group Lawyers)

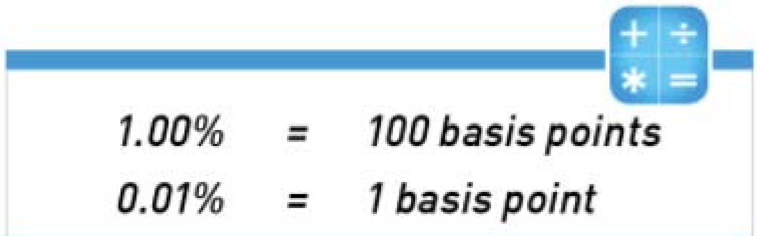
Beeps

Definition of 'Beep'

'Beep' is financial industry jargon for basis point, which is 1/100 of a percentage point in the context of interest rates, bond yields and other debt instruments. The term came into popular usage as an easier way of referring to the basis points as bps. Because basis points express percentages of change, not dollars, they have limited use in quoting stock prices.
http://www.investopedia.com/terms/b/beep.asp



'Beep' Usage

Investment professionals regularly refer to 'basis points' when discussing things like bond yields and mutual funds.

Why does this seemingly tiny unit of measure—one basis point is equal to one one-hundredth of a percentage point—get so much attention? It's pretty simple: Basis points can add up to a lot of money for both individual investors and institutions.

Table of Contents

Executive Overview

"The only aspect of investing, that investors' can control, is their Fees"

And what you can't control will erode your Nest-Egg. At present the majority of Canadians' get paid 2 times per month. Yet they pay their mutual fund fees daily; approximately 20 times per month. And they don't know their Total of Embedded Mutual Fund Fees. Nor their Embedded Commissions they are paying as well.

With the rise of low-fee ETFs, CRM2 sharing Fees & Performance (I've coined CRM2 to be CRM ½, explained later), the proliferation of low-fee Robo-Advisors, an overall decline of DB pension plans, upcoming regulations regarding financial industry Titles & Licensing, etc … the 'Billing System' of the Canadian Wealth Industry is being addressed through CSA 81-408 – CONSULTATION ON THE OPTION OF DISCONTINUING EMBEDDED COMMISSIONS.

The most lucrative aspect of the Billing System is Basis Points (a.k.a. Beeps); all sales people want Beeps. But Canadian Investors; including seniors and millennials, really want and need Liquidity and Advice. They aren't receiving this, thus, the following 3 statements:

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.
The Mutual Fund Industry is guilty of Commission Laundering
In 2017, DSC Month, and/or re-DSC Month, will be October.

Within the Beep Brief, you'll find **Solutions** to the Embedded Commission Billing System; including The Beep Ban (Solution2). And proposed Government actions (Solution1).

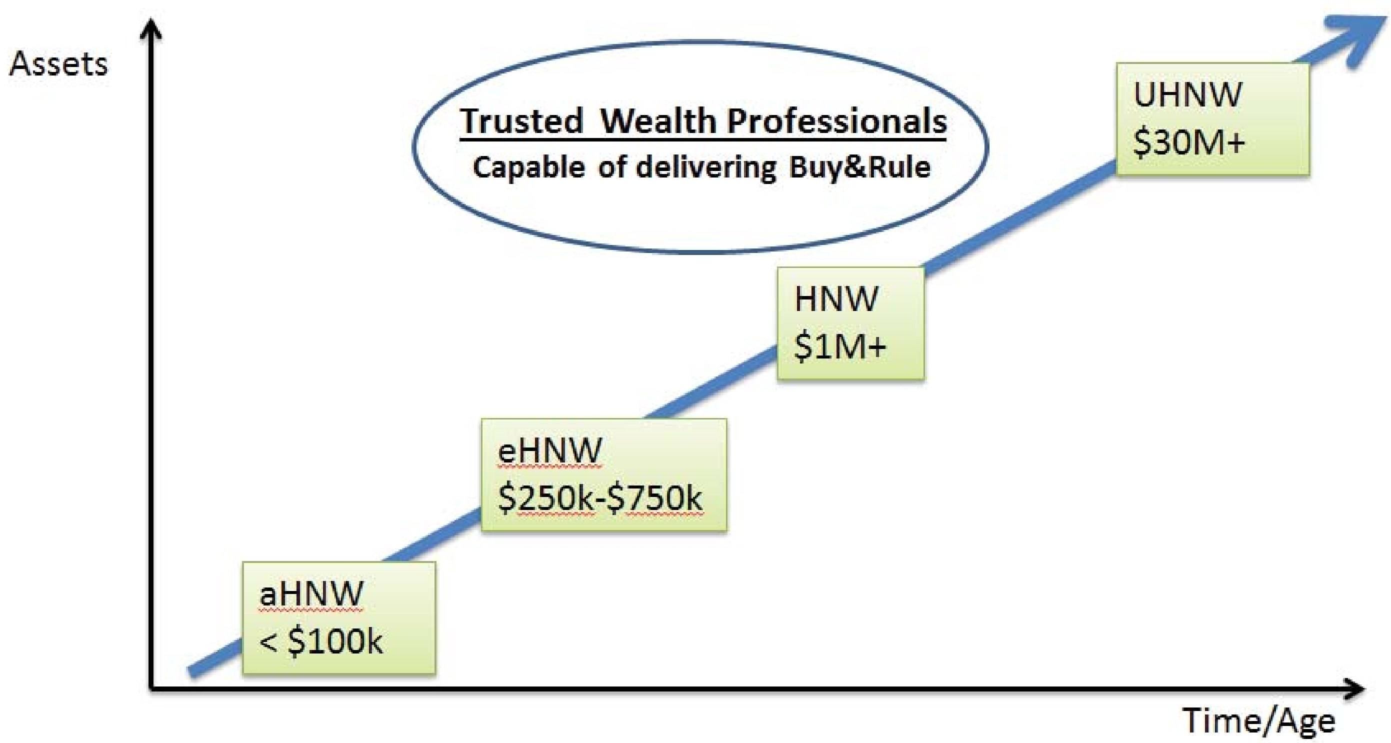
The Beep Brief also provides a look through the **Crystal Ball**; addressing the 'Advice Gap' for aHNW and eHNW. It is expected Robo-Advisors will 'take' the aHNW marketplace. IIROC

Advisors will dominate the eHNW and HNW marketplaces. And the UHNW may chose to move a portion of their assets to Buy&Rule ® as well.

The image below defines:

- aHNW; aspiring High Net Worth
- eHNW; emerging High Net Worth
- HNW; High Net Worth, and
- UHNW; Ultra High Net Worth

The Asset amount delineations are arbitrary, but quite close to actual High Net Worth 'practices' in place today by the Wealth Industry.



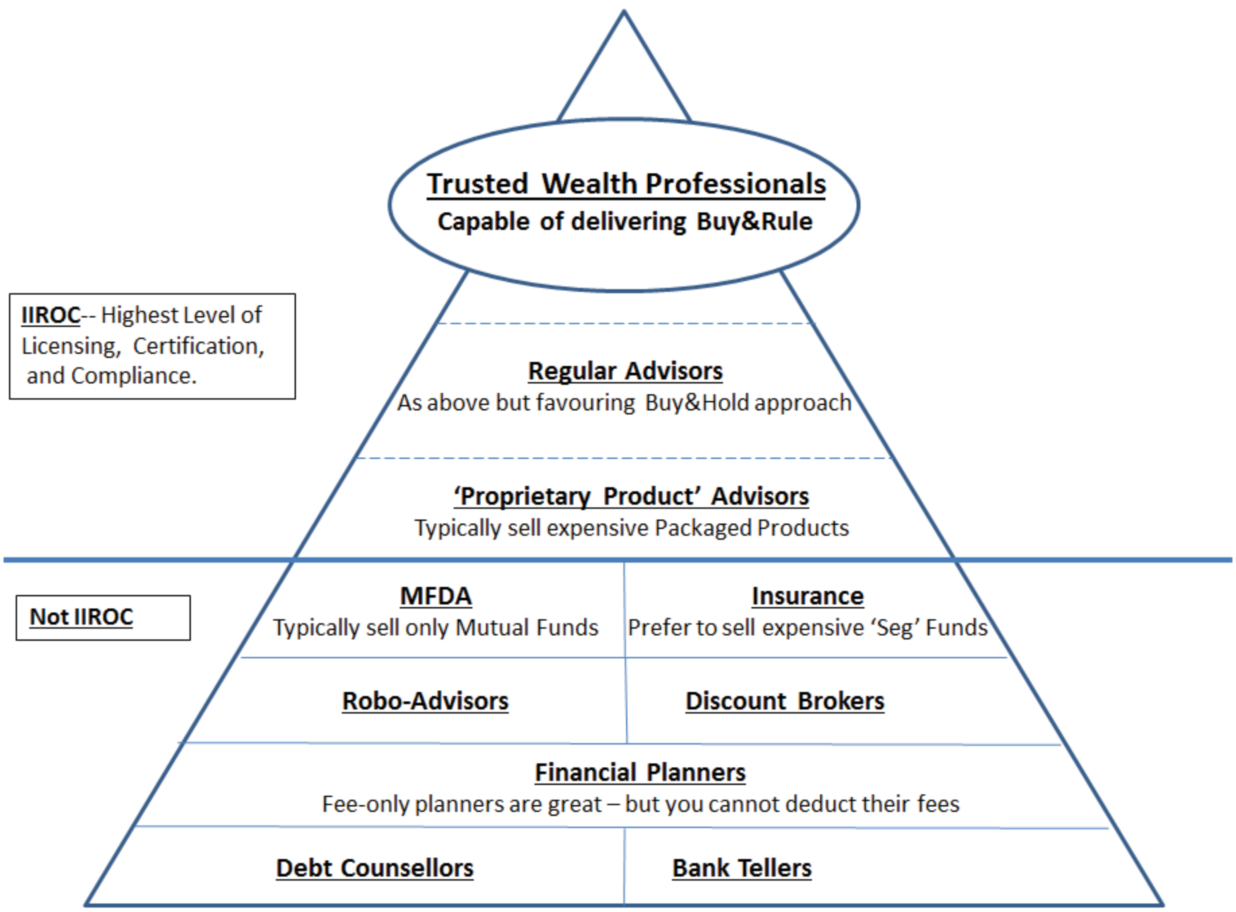
The overall theme of the Beep Brief is that Liquidity provides the Best Outcome, removing Embedded Fees will provide Liquidity to Canadians' and the opportunity to prosper.

Financial Literacy is only part of the solution; Regulators must provide Leadership such that the un-regulated marketing 'spin' of captive assets does not lead to Lesser Outcomes. Removing Embedded Commissions providers the Leadership necessary for overall Canadians' Wealth prosperity.

And there are other actions that Regulators can take; please see the 21 Solutions in the Beep Brief.

But it all boils down to Choice; where can I obtain access to ALL the Investment Styles (ie. Buy&Rule ®), ALL the Investment Products & Fees and ALL the Investment-related Services.

Choice = Liquidity



And IIROC advisors can provide the Choice.

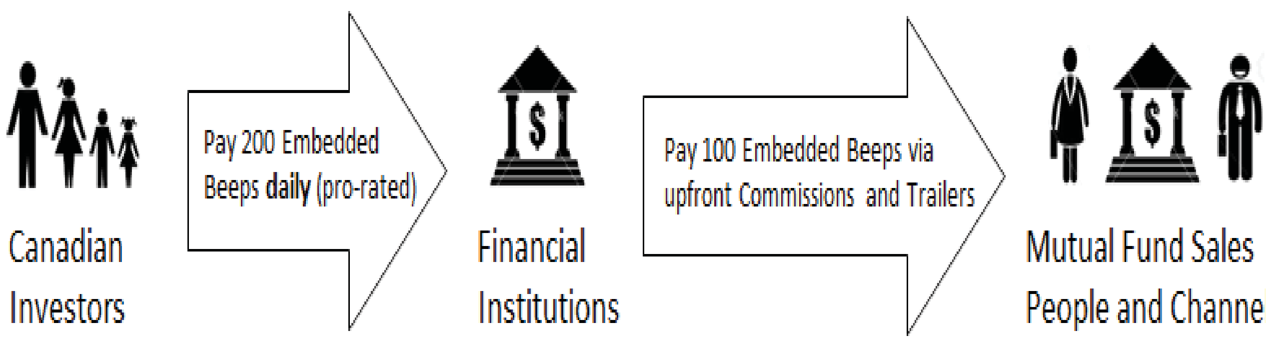
My name is Gerry Gabon and I recently founded an innovative educational platform named Trusted Wealth Professionals. I am a software engineer (UofT - EngSci 8T5) with an MBA specializing in Finance (York - 1991). I have over 30 years of investing experience (direct trading, mutual funds, proprietary product sellers, discount brokers and two different full-service IIROC firms) and several pioneering roles with WealthTech solution providers (IBM, Financial Models, Certicom, SYMCOR, etc …). At Financial Models I sold PAGES; a Financially Intelligent Statement Generation software solution for the HNW Investment Counsellors. At IBM I deployed Broker Workstations for the Brokerage community while also porting Trading Systems. I also recently toured extensively the 'Individual Pension Plan' marketplace for Business Owners and met 100's of Advisors.

I am extremely passionate about connecting the Canadian investors with the trusted professionals they need to maximize their personal Wealth outcomes. And to that end, that is why I founded Trusted Wealth Professionals (www.TrustedWealthProfessionals.com) and why it will become the Trusted Voice of Canadians' Wealth. The Canadian Investors' Source (CIC Course) is on the website, but that is only the first step. Canadians' need to trust their wealth professionals and that mandate is quite too often fraught with many self-serving agendas; namely KYC – Know Your Commissions.

In our current economic environment, Baby-Boomers are aging, markets are experiencing an extended Bull period (with no hint of a Bear), ETFs are rising in AUM, CRM2 is half delivered (my own term is CRM ½), FinTech and Robo's are emerging, regulations and RegTech is evolving rapidly, etc … and it has become apparent that Profiteering is abundant within the Wealth+Financial Services Sector. The Beep Party is raging. Everyone wants Beeps.

Embedded Commissions, is just another form of Beep Sharing. For example, a 2% MER on a Mutual Fund is generally 'split' into two 1% halves. One half, 1%, or 100 basis points, is kept by the Mutual Fund Manufacturer (ie. Financial Institution) and the second half, the other 1%, or 100 basis points, is given to the Seller (the Channel and Sales People). So "100 Beeps for you and 100 Beeps for me". This is the 'Beep Party' a.k.a. Embedded Commissions.



This timely response serves to support the CSA's position that Embedded Commissions can have a negative impact on overall Canadians' Wealth. This submission will include a few diagrams, a couple of new colloquial expressions, and will introduce the following Points:

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.

The Mutual Fund Industry is guilty of Commission Laundering

The underlying preposition of the Beep Brief is that of Liquidity; best understood as non-Liquidity, or Illiquidity. If you are denied Liquidity, because of the underlying instrument, or the Sales Channel, your Outcome is lessened.

The Embedded Commissions within the Mutual Funds fee structure, and similar other Beep-based fees structures, from any/all Wealth industry participants, deny Liquidity to Canadian Investors. And when Liquidity is denied, sub-optimal Outcomes can be achieved. Please note this is only 99% proven via recent ETF vs. MF comparisons and summarizations of HNW clientele's investing approaches, but if you ask Canadians to choose from the Grid below, you'll see the informal results below.

Canadians' Choice for Products & Fees

Products & Fees	Embedded Commissions	Appropriate Transparent Fee for Advice + Service
Illiquid Products		
Financial Securities with Liquidity		
The reason is that you cannot trust self-serving surveys, if you were to explain to Canadians' the truth about their Choices, they choose the Green CheckMark above.
Please note that this submission to the CSA may not be your typical response. But in a professional manner, it is designed to be memorable, and in a free-format manner. And where possible, I provide **Solutions**, to Canadian Investors, Regulators and Industry Participants because I am purposefully not licensed to sell a financial security and that allows me to provide trusted and impactful Leadership.

Of note, I will probably term Banks' Advisors via the term 'Tellers', Mutual Funds sales people, and proprietary product sales people (ie. from Investors Group), interchangeably, as recipients of Embedded Commissions. And I'll probably touch upon why:

In 2017, DSC Month, and/or re-DSC Month, will be October.

Please enjoy the Beep Brief and if you have any questions feel free to contact me. Thank you again for your time and consideration.

Thought Leadership re: Beeps

As a Canadian, and cognizant of commercial ongoings in North America overall, you are probably well aware that 'Everything is a Billing System'. Not only from my startup efforts and software engineering successes, but from my own personal consumption, nothing is more apparent than '<u>How are they going to charge me?</u>' I can belabor this point, but it is wickedly emphasized that during the Dot-Com Dot-Bomb period of 2000-02, when software companies that 'did nothing' except allow internet providers the ability to customize their billing systems, they were acquired for billions of dollars. Think now to your current cellphone carrier and the myriad of data plan options. Or consider your cable TV plan (if you still have one); look at the bundling and un-bundling options you have. We live in the world of Billing Systems.

And the financial services sector is no different, except the 'Billing System' is generally hidden; especially if you are invested in Mutual Funds. Ask yourself, "How many Beeps did I pay today?", "Did you get my Beeps today?", or "Did you correctly charge me the appropriate Beeps?" Maybe they gave you this T-Shirt as a form of reassurance.

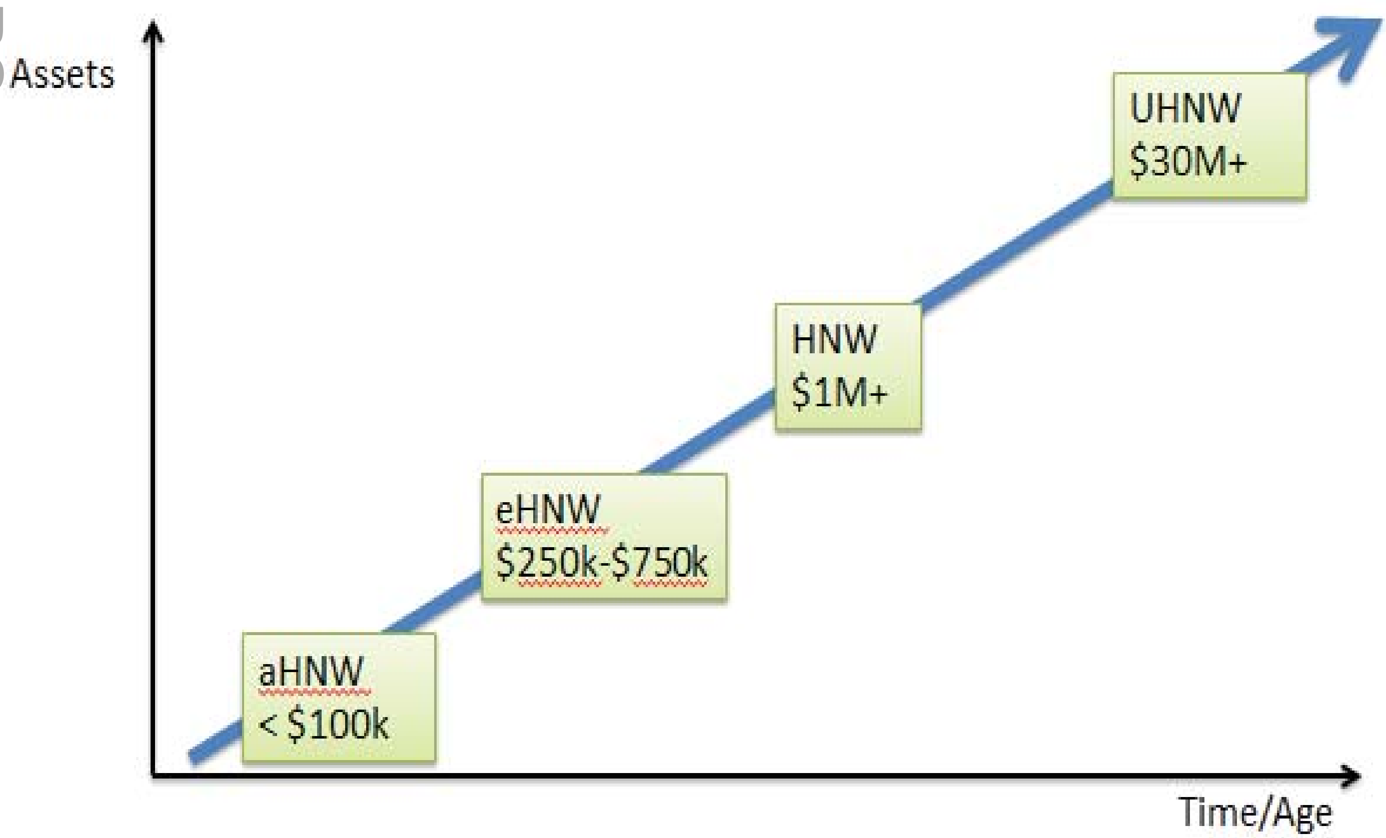
Front

Back

So I honestly can't recall if I learned about the Embedded Commissions response from a colleague, or the OSC's GetSmarterAboutMoney (website or newsletter). But, in either case I felt it was important to dovetail this initiative into the mandate of Trusted Wealth Professionals. Thus, I obtained the 169 page PDF, CSA CONSULTATION PAPER 81-408, starting reading and making notes, and I participated in the associated Webinar. And then I started re-reading, and making more notes, and really appreciating the effort the CSA undertook to produce 81-408.

But as I started to respond, I realized the evidenced-based approach undertaken by the CSA was quite complete, and I don't have the time+resources to commission new studies based on my own unique prepositions.   What stuck in my mind was the comment made on the OSC's webinar is that they, the OSC, are seeking 'Something New'. And when that thought process was woven together with the Embedded Commission Point & Counter-Point that was played out in the media, the Beep Brief was conceived.   This is the opportunity to provide Thought Leadership to Canadians.

The starting point is understanding one of my favourite sayings "How Big Is Your Stack?". It's an analogy from the game of Poker that forces the card holder to 'compare'. And that is critical, the word 'compare'. If you compare yourself to the HNW figure below, a categorization and tiering of High-Net Worth people, you'll see where you stand. The lowercase 'a' is for Aspiring and the 'e' is for Emerging. The capital 'U' has been interchangeably termed 'Ultra' or 'Unicorn'. The start-point and end-point of the individual tiers were chosen by me and purposefully left with gaps such that it is known that 'gapping up' is a discrete step. The 'gaps' set higher targets such that when you have $800k you can say to yourself "I'm not a High Net Worth person yet until I reach $1M". HNW is defined as $1M in net assets, outside of principal residence/home.



It should also be noted that aHNW are just one college/university degree, or one wedding, etc … away from having to start Saving over again. And the tiers I have chosen also tend to coincide with chosen net asset levels by the highest licensed investment professionals; namely the full-service IIROC advisor.

Notwithstanding the stereo-typical objectives of the HNW community, you could express the investing needs of the HNW as per the grid below:

Tiers & Needs	Growth	Growth + Income	Income
aHNW	✓		
eHNW	✓		
HNW		✓	
UHNW			✓

The Financial Services industry is best served by providing advice + counsel via:
1. Fee Transparency; not via Embedded Commissions and certainly not via the initial convoluted CRM ½
2. Liquidity; not constrained by a Billing System, an 'at loss' Commissioned Sales Person or an after-hours settlement process.

Let's now take a closer look at the 2 main points I stated earlier.

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.

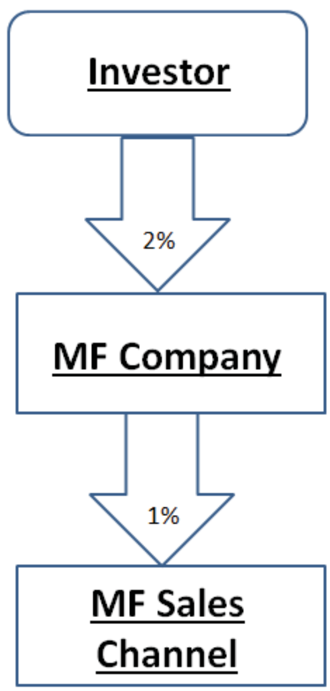
The Mutual Fund Industry is guilty of Commission Laundering

And we'll also consider this bonus point as well

In 2017, DSC Month, or re-DSC Month, will be October

It should also be noted, that just as 'Everything is a Billing System', the sales channel should not be ignored. The 'Sales Channel is Very Powerful' and should always be considered when innovation or disruption is contemplated.

The concept of the Sales Channel that I'll general refer to in the Beep Brief is illustrated below. I've used a few MER percentages, just as examples, but this is in my opinion a high-level view of the CSA's starting point to discontinue Embedded Commissions.



Point # 1 – First Half – "commission-based scheme"

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.

There are 2 halves to this statement about Mutual Funds

commission-based scheme
semi-liquid asset class

And the connector is the word **masquerade**.

Whether you consider, from an overall perspective Point #1 to be a harsh statement, or an illuminating statement, its origins are actually re-purposed from a similar statement about Hedge Funds. And there is a lot within the 14 words, so let's tackle the 3 main components in order.

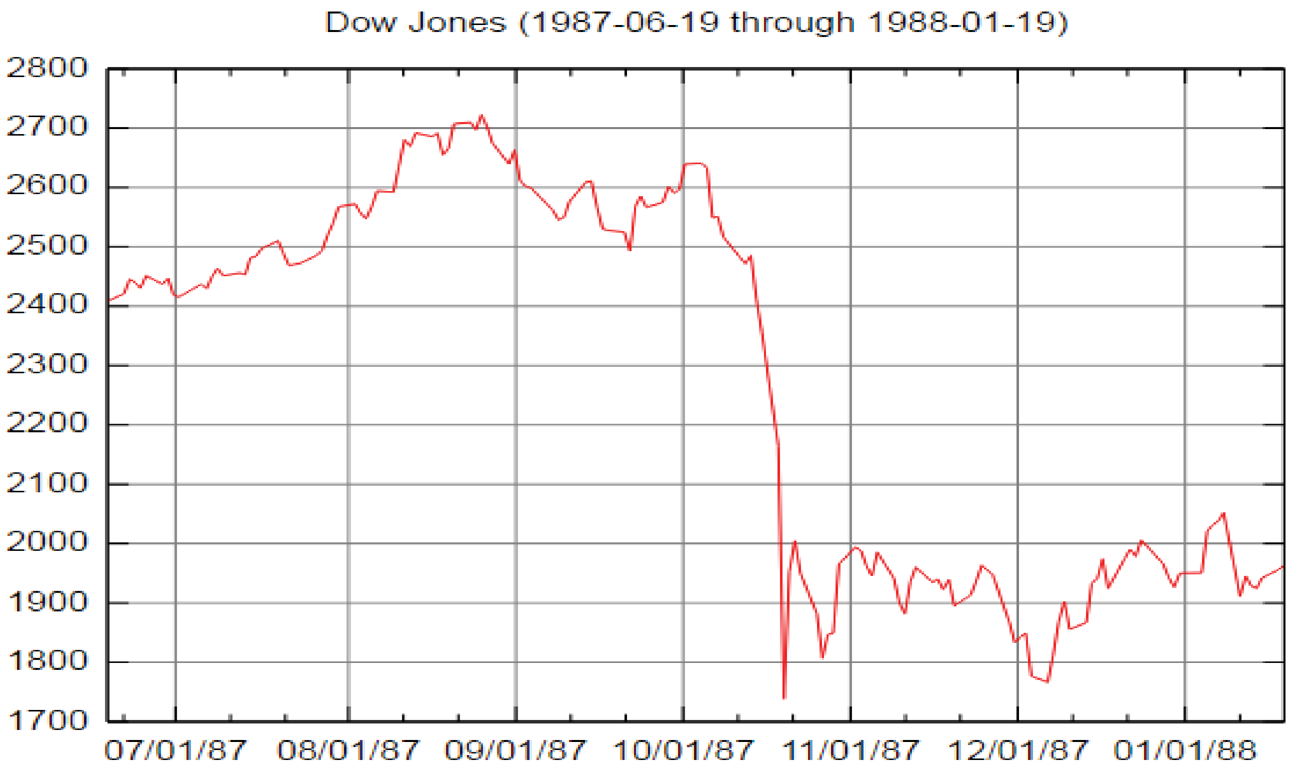
<u>"Commission-based scheme"</u>
Quick Background; and everyone has their own version of these details+facts.

In September 1987, MacKenize Financial brought a new compensation scheme North of the border, DSC's (Deferred Sales Charges); and introduced the DSC's through a new Mutual Fund called Horizons. Mutual Funds were typically sold with a 1-time upfront sales charge. Thus the 'hook' to keep investors buying the new Horizons Mutual Fund products was to pay the Sales Channel the upfront DSC fee, but lock-in the Investor with 5-7 year clause that made them liable for the Sale Channel Fee. So, a double-win was achieved, an easier lucrative sale for the Mutual Fund Sales Channel, and a guarantee to the Mutual Fund manufacturer that they had a recourse against any commission shortfalls (if the investor redeemed their funds).

All the subsequent Billing System terminology such as Front-End loading, no Load, Trailer Fees, etc … are just schemes to incent the Sales Channel to keep selling Mutual Funds.

Now MacKenzie was very fortunate as the Horizon product did not 'sell out' in September 1987, and later, in October of 1987 there was Black Monday, a decline of 22% on the S&P 500.

Afterwards it was a great buying opportunity and Horizons eventually became a flagship offering by MacKenzie. Black Monday is shown in the image below.



But without going into the euphoria of retail investors, many of whom had not seen a crash or a correction, and were struggling with mortgage rates of 14% (or higher), the DSC became the 'juice', the 'drug', the 'pill', for the Mutual Fund sales channel.

This translated into Buy&Hold, the absence of Advice, and made the Mutual Fund manufacturers increasingly more desperate/competitive to maintain+grow their marketshare. So commissions to the MF sales channel became the battle-ground. And the Billing System for Mutual Funds became paramount and the Beep Party started. The 'Scheme' was in full swing.

Plus the entry point into the Beep Party was joining the MFL; Minimal Financial Licensing, in other words, your Mutual Fund Sales Licence. Of note, in the coming months, the MFL will be explained in detail at www.TrustedWealthProfessionals.com.

As a side note, I had the opportunity, while at SYMCOR, to work with the CoreLan founders who built FundServ (no 'e' in FundServ), one of the first (and still in use today I believe) Mutual Fund settlement systems (circa late 1990's). This system essentially takes the daily NAV (Net Asset Value), from another system at 4:01pm (or later) each day, after the market has closed, and ensures the Mutual Fund Buys & Sells are properly administrated. The daily NAV is calculated by the Mutual Fund company first by siphoning their pro-rata amount of the MER before deciding how much is left, per unit, for the Mutual Fund investors.

So I pay daily my mutual fund fees, and we are back to the phrase '**commission-based scheme';** which begs the question "If it isn't a commission, what am I actually getting?" And "Why am I paying daily?" Of note, with a full-service IIROC investment advisor, you pay every 30 or 90 days, in arrears, the average AUM, for the period, and you can pay externally, not from cash within your account or by liquidating holdings. Please note, this external payment rule is changing slightly in 2018 for RRSP and TFSA (Registered plans) but will still remain the same for Taxable or Investment accounts (non-Registered). But it is key to note, that in a Fee-Based account, with an IIROC firm, you are paying once, in arrears, every 30-90 days, versus the possible 60 daily Mutual Fund fee (in a given quarter).

The question still remains, "What is my 100 Beeps to the MF sales channel getting me?" I'll claim it is not advice, because investing advice has two components; namely a Buy and a Sell. You can have a 'Paper Profit', but it is not realized until you sell. And if you Sell, your MF Sales Channel loses Beeps, there is no longer a commission for them (Embedded or otherwise). Do you ever sell a Seg Fund? Or a Target-Date Fund? Probably not, you Hold, so there is no Advice. Again, of interest, with a full-service IIROC investment advisor, you can Sell, and make a real profit. It is a commission to the investment advisor, if you are in a commissioned account, (these accounts are less than 10% of the accounts today). But in a Fee-Based account (more than 90% of the accounts today), you probably have 100, or 150 free trades (maybe more), and the advisor is still compensated if you are sitting in Cash/E (my own term for Cash and/or Equivalents).

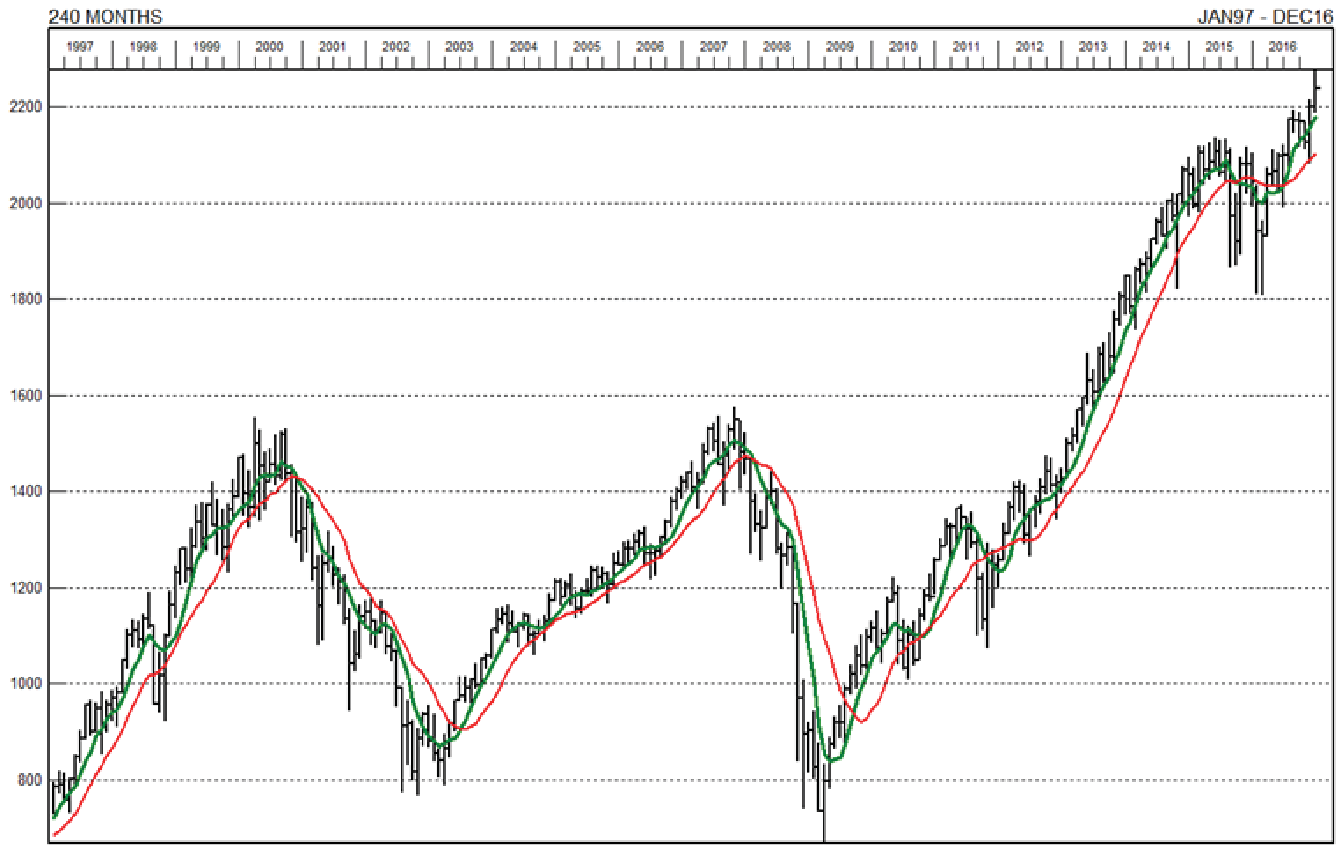
In 2016, there may have been a couple of times to sit in Cash/E. Brexit occurred in Summer of 2016 and in the Fall there was a USA election. And a pertinent FBI investigation. Then there wasn't an FBI investigation. Then the story continues into 2017. There was a FBI investigation. Then then FBI director got fired. Then there was a new FBI investigation. And on Thursday June 8th, we had ex-FBI testimont, and a British Election. All while 5 year Canadian GICs are yielding less than 2% and 'Trade Wars' are coming (ie. autos, lumber, dairy, etc …). Everyone has forgotten Chinese GDP, oil prices, real earnings, etc … but the point is that there may have been a reason to change Mutual Funds, if not Sell outright.

The 5 trading days surrounding Brexit are illustrated below. The market dropped for 2 days, about 900 points and then recovered in the next 3 days. No-one knew that in advance. You could have sat on the sidelines and slept at night. You may have wanted to Sell.

The USA election + Trump's victory was quite similar as well (but more pronounced), there was an overnight low but then an intra-day high that lead to the "march to 20,000" for the DJIA. But the Mutual Fund sales channel does not get compensated if you Sell and chose to stay in Cash/E; they lose Beeps. If you buy a GIC they lose Beeps as well.

If you look at the chart below, the last 20 years of the S&P 500, from 1997 to 2016, there may have been a couple of times to Sell. The last drawn-down, a Bear market between 2007-09, was 54% and took almost 5 years to recover. "Do you want to lose 54% or your current pay cheque?" If not, why lose (potentially) 54% of your retirement pay cheque. But wait, that can't happen now. So then don't look at the earlier drawdown of 2000-02 (a 49% decline I believe).

HNW investors can sleep at night because they have Liquidity. And professional Advice from the highest licensed advisors.. They can Exit & Enter the market, without impacting their Advisor Fee-Based compensation. Mutual Fund investors, aHNW and eHNW cannot achive this Liquidity.



John Grisham’s first book, A Time to Sell, I changed the title a bit to make the point, illustrates that if probably better to Buy&Rule ®, more on this at www.TrustedWealthProfessionals.com in the coming months as well, than to Buy&Keep-Paying-the-Mutual-Fund-Sales-Channel-A-Commission.

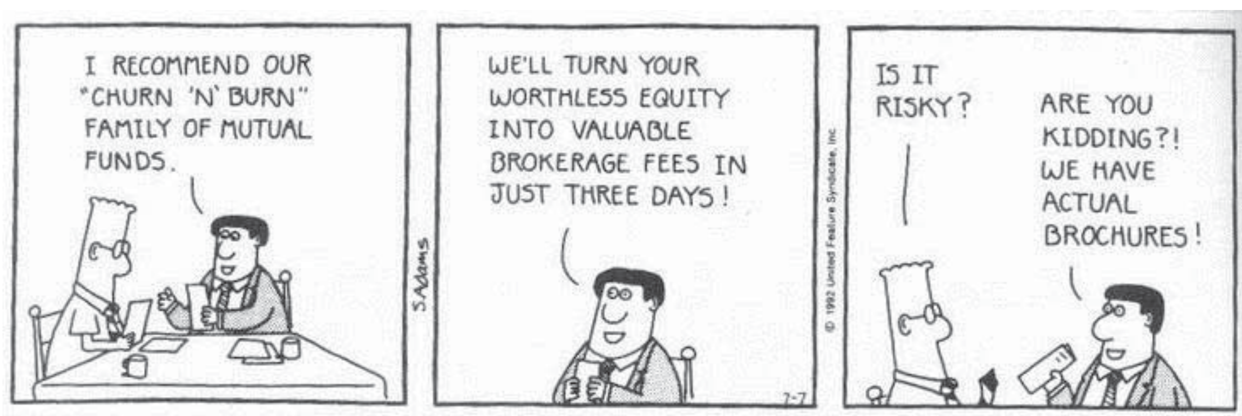
Sidenote: The Beep Brief was coined from another of John Grisham’s books, The Pelican Brief.

And before I’m accused of turning the Beep Brief into a personal commercial, or hate-mongering against the Mutual Funds industry, let’s concentrate on the topic of this subsection. You might need to be an industry participant, or sophisticated investor, to appreciate some of these thoughts, but here is why Mutual Funds are a ‘Commission Based Scheme’:

1. You don’t Sell if and when the professional Rules indicate to do so. What if the market was down 50% and headed down 49% more tomorrow, would you sell? Would you Sell if the market was up 300% and everyone in the world (Jimmy and Warren Buffet included) were screaming “Over-Valued … Get Out Now”?
2. DSC’s prevent you from selling (5-7 year contract). And in fairness to the much maligned Investors Group (and others) it appears that they are easing their DSC and re-DSC policies, but the wording in their latest press release (September 2016) implies if we’ve DSC-ed you before, we’ll keep DSC-ing you again. Known as the re-DSC. Maybe I’m wrong, but I have a friend with a total of $800k at Investors Group and his RRSP holdings

span over 50 separate Mutual Funds, each with a balance of ranging between $6,000 to $28,000. 50 Different Funds? Really? 50 Different Funds? How did this happen? Well, when the 5-7 year DSC clock started expiring on the Mutual Funds, the Investors Group Mutual Fund sales person kept shoving the now commission-free funds into a new Mutual Fund that paid the upfront DSC commission (this is the known as the DSC 'drug', 'pill', or 'juice'; pick your 'poison' for the correct term).

3. Seg funds encourage you to hold for 10 years. Why? They virtually never pay out (the insurance). And if you need Growth, you don't need to annually pay 300 Beeps (or more). And yes I know that some Seg Funds charge less; just ask the 27 year girl who got hustled into a Seg Fund by her company's Benefits provider. She doesn't need any of the Seg Fund insurance benefits when she has 38 more years to go before age 65.
4. Target Date Funds encourage you to hold 'forever'. Why? What do the 100 Beeps for the Sales Channel provide for, Advice? I say NOT.
5. ETF's have no commissions and overall lower product fees, but your MFDA or MFL (Minimal Financial Licensing) sales person cannot sell them to you. And there is no Commission for selling an ETF. Please remember that a MFDA licensed sales person is one of the lowest forms of licensing for financial products sales people; and I'll reiterate, I term this licensing MFL.

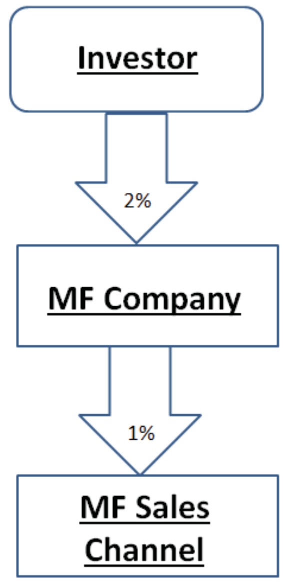


6. And Mutual Funds comprised of ETFs is just another way to keep paying Beeps (this is offered mainly via your bank). I'm astounded that Canadians' pay Beeps for this Fund-of-ETFs scheme. Quite astounded. Please see Solution 15.
7. Did you know your bank keeps an overwhelming proportion of the 100 Beeps typically paid to the Mutual Fund Sales Channel? So the Banks keeps the first 100 Beeps as the Mutual Fund manufacturer, and then the lion's share of the second 100 Beeps (no disrespect to the bank with the Lion-in-their-Logo; all Banks and medium to large Financial Institutions do this). It's known as Beep Hoarding. And it is quite profitable for the banks. That's why their Mutual Fund people turnover every 8 months, they want to sell Mutual Funds to you and get a full Beep Commission.

8. You paid for Beeps today to your mutual fund company when the NAV was calculated, but you don't know how much. You may have purchased the Mutual Fund through a Bank Teller, Mutual Fund Sales person, Insurance Sales Person or perhaps a Discount Broker, it doesn't matter, if the stock market was open today, you paid Mutual Fund Fees today and you don't know how much.
9. Discount Brokers, they prefer to be called Online Brokers, offer A-class, D-class and sometime F-class mutual funds. This may be changing (quite soon) and perhaps it will be enacted one day that D-class funds are not more expensive than F-class funds (sometimes). Better still, there's probably an ETF for your investing needs, that doesn't 'game' you in the highest Beep level; an 'A' class fund looks better to you then an 'F' class fund; think of school 'letter grading' to convince you why an 'A' is better than an 'F' and why this is part of a Scheme.
10. And there is always the nominal total amount of Beeps. Not Beeps a percentage but Beeps as a total dollar amount. CRM ½ only showed me half my Fees. The second half of CRM ½ (on track for 2018) will show me total fees; what the Beeps mean to my overall Wealth. I can't eat a Beep. Or spend a Beep. Everything has to translate back to dollars&cents. And this is a trick that was taught to me by an insurance sales person, human beings are bad at math, especially percentages. You can sell more to them when they don't understand the comparison to a big screen TV, a mortgage payment or a weekly grocery bill. If an investor is about to place $500,000 in a Mutual Fund with a 2% MER, tell them there are paying $10,000/year in total fees (not a 2% MER). Investors know if sales tax goes from 13% to 14% in Ontario, that the increase is 'not good' but they don't understand what difference a MER of 1.8% is versus a MER of 2.2% means; and this is amplified when the equivalent 'Indexing' ETFs is 0.07% to 0.25%. A Scheme is not portraying the Total Fees upfront, when buying the Mutual Funds, you have to wait for an End-of-Year-statement and CRM ½ + CRM ½ to understand what you really paid in total Mutual Fund Fees.
11. Over 30+ years of falling interest rates might mean that old ratios might not hold true in this period of sideways/rising rates (ie. Target Date Funds with Tactical Asset Allocation). The Scheme being that "Say Anything" and introduce new products at the top of a Bull market to keep the Beeps coming. Especially products like Seg Funds and Target Date Funds that lock clients into paying Beeps. Or DSC/re-DSC them at the top of the market. One day there might be a 'cooling off period' for Financial Services product purchases, but until then, Sell Anything will accompany Say Anything.
12. I don't understand why TERs, Trading Expense Ratios, appear to be uncapped. My gut feel says Bond Fund managers are going to have to 'trade' more frequently if interest rates keep rising. This seems to be an area where a blank cheque is issued to the fund manager. TERs = Beeps, but that's kept secret/unknown. The temporal update to this is that the USA mid to long bonds are not rising while Janet Yellen appears to be raising

USA interest rates in June. Possible inverted yield curve? End result, more Bond trading and higher TERs? Uncapped and unknown ETRs.

13. But the perhaps #1 reason why Mutual Funds are really part of a **Commission-Based Scheme**, think of this image below.



Where else in your life do you pay the manufacturer first? What item -- food, hydro, property tax, cellphone, gasoline, insurance, etc – do you pay the Manufacturer first? And then they pay the Sales Channel afterwards? This Scheme infuriates me; where else do you pay the Manufacturer who then pays the Channel (for consumer and commonplace products)?

Think about this. The Mutual Fund sales company has no bad debts, no accounts receivable, no collection agency, no invoices to their clientele, etc … It's all part of an Embedded Scheme. And Commissions are buried within this Embedded Scheme. And they pay themselves daily. Did you get paid today? Do you get paid 238 times a year? That's 250 working days minus a few statutory holidays.

There are 3 Known's in the Investing World:

1. There are Guaranteed Investments (think T-Bills, not Home Capital GICs)
2. There are **non**-Guaranteed Investments; pretty much everything else.
3. But, there are Guaranteed Mutual Fund Fees/Commissions. So much so 'Guaranteed' they're perceived as a form of Entitlement. A Right. If it is a Monday, Tuesday, Wednesday, Thursday or Friday, but not a market-closing holiday, you paid your mutual fund company today. But chances are you get paid bi-weekly, once every 10 business days. Albeit small payments, but you are paying daily your pro-rated Beeps/MER.

That's why it is a Scheme.

Point # 1 – Second Half – "semi-liquid asset class"

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.

If you have purchased a Labour Sponsored Fund, for the upfront tax break, you might have found that there are only 2 very short windows per year to sell your investment (it is possible the window is only open for a few minutes, I'm not joking). Illiquid.

You might have purchased a top-off-the-market exotic Structured Note, fully well knowing that you need a few phones calls, and possibly a few days, to sell in a Secondary market (probably below market value). Illiquid.

And you've got any stock, bond, or ETF in the world, and the local stock market is open, and you can sell (or even buy more). Liquid.

Those are the definitions of Illiquid vs. full-liquidity. But Mutual Funds are semi-liquid. You can Sell or Buy at 4:01pm EST, after the TSE or NYSE has closed (we're using the common exchanges for reference). You can't Buy or Sell during the trading day, but you don't need to wait Days to transact. Semi-Liquid.

So as I type the Beep Brief, I occasionally glance at the clock, it's 11:33am and then 2:28pm, I just heard that Bombardier is receiving consideration from the Canadian Government. My belief is that there are 10 more years of growth in Bombardier and I can buy the individual shares (BBD.B) or an ETF holding the shares. Right now. Liquid.

But not with a mutual fund. I have to wait until to 4:01pm to get 'filled' (and only then will I know the final price). But that's only the case if place the order online. It's the same scenario if I want to sell BBD.B as well (or the ETF holding BBD.B). I just want to sleep at night. I don't want to even buy GOLD (that's Randgold Resources Limited). Same goes for Nike, TransAlta, Amazon, CIBC, etc … if there's news, or if I have idea that is percolating in my brain, I can buy or sell individual shares, or ETFs, when the market is open, but with a mutual fund I transact when the market is closed (seems 'weird', almost counter-intuitive to the word 'investing'). Semi-Liquid.

And if I'm not online with my Mutual Fund company, if I deal personally with the mutual fund sales person, or her/his company, then I need to pick up the telephone. I want to Sell my Mutual Funds. Let's assume that interest rates are rising and are now at 18% as they were in the mid 1980's and I want to sit in GICs. All my friends are doing this now. Or even more plausible, I just want to have 6% a year as a rate of return, net of fees; pension style investing.

And I want to sleep at night. I've met my objectives for the year, I'm good with stepping out of the market (there is a lot of turmoil at present). So if you want to Sell your mutual funds, the sales process has now reversed, you are going to have to be really persuasive because there is a Loss that is going to occur. A Beep Loss. To the Mutual Fund Sales person. And a Beep Loss Prevention Mechanism now kicks in. You're essentially replacing a non-Guaranteed investment return with yourself (you are the investor) and taking a Guaranteed Commission away from a Sales Person. There is going to be a 'fight' to keep the Mutual Fund Sales Person's Beeps.

But aside from the human interaction, convincing the person who Beeped you, to unBeep you, is an effort that the retail investor is not well enough armed enough to undertake as the Beep Loss Prevention Manual possessed by the Mutual Fund Sales Person is quite extensive.

The bottom line is that Liquidity matters; if the underlying systems don't allow you to transact when you want to, or the Mutual Fund Sales Person doesn't want you to transact (ie. Sell) when you want to, you've been denied liquidity and by then it is too late. Bad Outcomes prevail.

Note1: I have taken it upon myself not to convey portions of the Beep Loss Prevention Manual, other than to say, the best counter starts with Liquidity Paper from yourself. Perhaps a 'play' on Liquid Paper, but your Liquidity Paper starts with a T2033/T2151 for different types of Registered money, or an Account Transfer Form from your new institution (they'll handle it for you). Allow 2-4 weeks and there might be small fees ($150 –ish) along the way. Either way, your investments are not permanently held at any Financial Institution; so your TFSA, RRSP, Pension, Taxable/Investment, RESP, etc … accounts can be moved where necessary. REPEAT – The Beep Loss Prevention Manual is where the Conflict of Interest arises; the Advisor will not prudently 'raise' Cash/E because she/he doesn't get a commission cheque (possibly a Clawback as well; it depends upon the Commission Scheme and Billing System deployed).

Note1 Caveat: You'll soon find out if you have Proprietary products, Deferred Sales Charges (DSC's) or other exorbitant fees within your account holdings+investments. Try to determine if you have 'Fee Creep' when moving your assets as well; that is unknown and increasing Fees that keep Creeping/Popping-Up when you're moving assets. And I've been asked a few times already, "Should I move from Investors Group to a full-service IIROC life-licensed investment advisor, without knowing what my DSC fees will be?" And my answer is that assuming you have a worst case 250 Beep DSC Holdback, you might find that Fee-based full-service IIROC life-licensed investment advisor actually costs you less over a 5 year investment time period, thus justifying the Fees. I won't use Fear to make this point, that Buy&Hold-ing through a 54% market is minor compared to 250 Beep DSC Holdback. Nor the point that full access to all investment Products, Services and Styles trumps the restrictive proprietary offerings. But I'll go out on a limb to that say that if we know 50% of marriages end in divorce, mainly based financial issues, then 50% of financial relationships end because of non-financial emotional issues (ie. Trust or Betrayal; I saw this on Oprah a few years ago). Anyways, you'll know when to issue your Liquidity Papers. Your new Wealth Institution can help you in this regard.

I'm not saying you need to stay invested, or exit the market, or rotate holdings through your portfolio, but if the Embedded Commissions Scheme are affecting your liquidity, either monetarily, procedurally, or psychologically, through word-of-mouth with your Advisor, or not, it ultimately affects Liquidity.

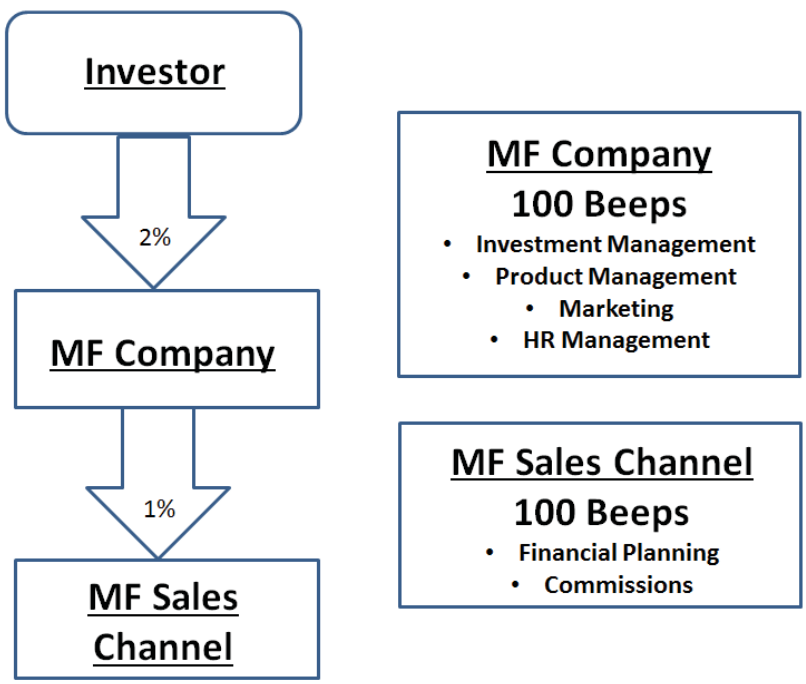
And lack of Liquidity is not good for Investors' Outcomes.

Point # 2 – Commission Laundering

The Mutual Fund Industry is guilty of Commission Laundering

Phew. I came to this conclusion, rightly or wrongly, by Googling and chatting with a variety of financial professionals. There are great articles on the Globe and Mail's website and Advisor.ca that deal with 'deductibility investment management fees'. If you Google that 'string', they will be the first few hits, and feel free to avail yourself of them. But I do think I'm correct in this regard, so here goes.

The background to the Laundering claim is that the entire MER, 200 Beeps, is deductible because it isn't a Commission and it isn't Financial Planning (both non-deductible by the CRA). Thus the entire MER is viewed as Investment Management Fee or Product-related fees. The 100 Beeps for the Mutual Fund company is clearly not Commission, as it is Investment/Product management fees. OK, I hear you, but I don't buy it. So let's look at the Beep Flow.



My thinking is that I have explained in Point 1 that there is no Advice nor Service within the Mutual Fund Sales Channel so the second half of the 200 Beeps paid by the investor, 100 Beeps, should not be deductible. It's a Commission only (and why you would keep paying it annually is criminal).

I know this is upsetting. And I have seen the IFIC breakdown on where the 200 Beeps are spent. And I'm not even concerned about why an ETF can deliver the same 'portfolio' for 4-7 Beeps, but we'll use 30 Beeps as an average (thanks CETFA for this fact).

MF Company

100 Beeps

- **Investment Management**
- **Product Management**
- **Marketing**
- **HR Management**

ETF Company

30 Beeps

- **Investment Management**
- **Product Management**

MF Sales Channel

100 Beeps

- **Financial Planning**
- **Commissions**

I haven't exhaustively surfed every Mutual Fund company's website, just a 'chosen' few, and I've read advertisements in the Globe and Mail (32 years and onward of continued daily reading), but I have noticed the word 'Commissions' with every description of Mutual Fund fees. That alone doesn't make the second 100 Beeps non-deductible; especially if I'm on the Mutual Fund company's website and it is the Sales Channel I'm concerned about.

And it doesn't matter that there is 'wordplay' regarding the words 'Advice' and 'Service'; it seems Commissions are the new 'Service'. Please ignore the spin.

Also, the presence of Mutual Fund Sales Persons T4 slip , or really the T4A, perhaps T5, but mainly T4A, for Commission Income isn't proof enough that the second 100 Beeps are really a Commission.

It boils downs to the fact, that beyond the Financial Planning, Licensing matters. Selling a Mutual Fund, with a Buy&Hold approach, DSC-ed or not, with an accompanying Trailer Fee, is a Commission. Because your Advice is always not to Sell; the second half of investing (Buy-ing first and then Sell-ing second). And that is non-Advice. And also not 'good' Advice.

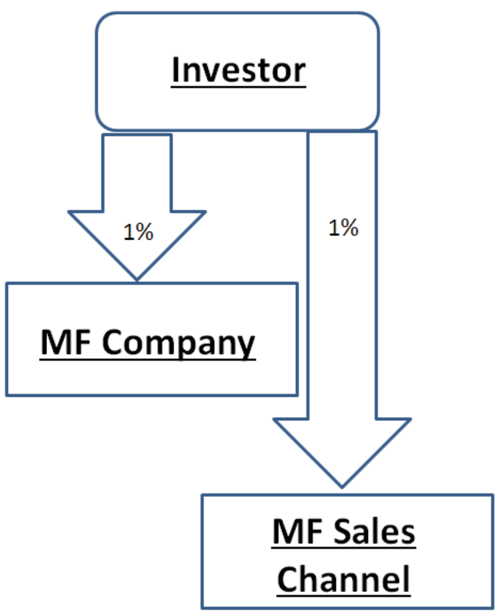
A Full-Service Life-Licensed IIROC advisor, hopefully one who practices Buy&Rule ®, and doesn't suffer from Financial Decidophobia (fear of making financial decisions), actually makes Buy&Sell decisions daily. This includes Portfoliio re-balancing via Buying and Selling, profit-taking by Selling, Buying new issues, Buying and Selling for Tactical Asset Allocation purpose based on KYC's and IPS's. Whether it be within a Discretionary account or not. In a Fee-Based account, this is not Commissions. This is Advice. This is Service. Deserving of Beeps. The full-service IIROC advisor does this daily, it's part of the work they do work clients. Mutual Fund Sales People do none of this, they aren't licensed to do so, they don't do any of this Buying and Selling advice. Sure they perform minimal KYC and IPS efforts, but not deserving of Beeps. Yes they perform some FinPlan work (I'm not sure of their licensing in this regard), but that's non-deductible work anyways.

If you don't have the Licensing, with corresponding Education, where the daily practice of evaluating Buying&Selling decisions exist because it is your job, then the second 100 Beeps is non-deductible. It's a Commission.

And it is Commission Laundering because if the same 100 Beep fee was payable directly the Mutual Fund Sales Channel it would be only Commission.

Buying&Holding a Mutual Fund, let's say 7 years until the DSC wears off, is not Advice; this is ignoring that there could be a 'Time to Sell'. Sending me a statement quarterly telling me the value of my holdings is not Service; it's a necessity, perhaps just to get into the Wealth Industry 'game'. Trying to make the argument that Commissions = Advice = Service because the MER is paid to the Mutual Fund Company, doesn't mean that a Commission is not a Commission.

In the following picture, if the second 100 Beep fee was payable directly the Mutual Fund Sales Channel, the payment would be recorded as a Sale; possibly deserving of a commission.



And if the compensation to the Sales Person was 100% variable, they had no base pay, and was based on Beeps, it would be a Commission for sure.

In the case of the Banks, where they sell their own proprietary Mutual Funds, through their branches, the Banks 'Beep Hoard' and the Teller (they were called Front Line Advisors in a recent CBC investigation), only receives a Bonus. A small bonus what I've learned; the bank Beeps Hoards the majority of the second 100 Beeps. That is why there is incredible turnover at the banks with respect to who is managing your account. The good Tellers get their CSC licence, join an IIROC firm and encourage Follow-Me-Beeps (while referring back to the replacement Teller, who soon has a depleted 'book'). The disgruntled and perhaps OK Tellers get their MFDA/CLU license and cherry pick their 'bank book' by High-Beeping (migrating their HNW clientele and possibly locking them in with Seg Funds or Target-Date-Funds). But all of this is reality only because a Commission, evidence by a Beep payout and lack of Licensing/Advice, is really a Commission. Laundered or not.

Of note, if you can't go to Cash/E because of the Sales Channel compensation scheme, please start completing your Liquidity Papers (transfer to another Wealth firm, perhaps via a Trusted Wealth Professional).

Consider this Compensation grid below. Based on the person serving you (so you can't skirt the rules and have one IIROC person, in a province far far far away, that is the defacto or totem IIROC person in your firm).

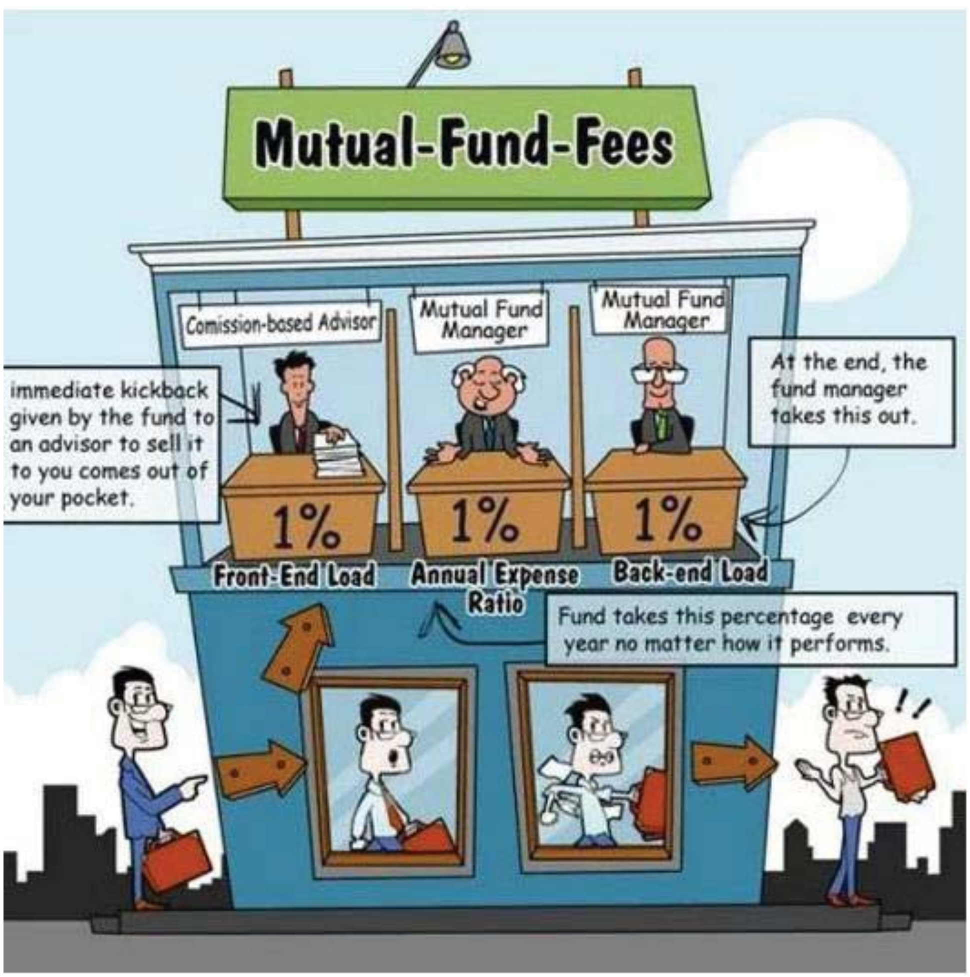
Licensing & Compensation	**Non-IIROC-Licensed** Ie. MFDA, CLU, other	**IIROC Licensed**
Compensation Alternatives	Flat bonus or tiered structured (can't look like a Beep). Can't be Laundered via creativity.	Beeps or other. All options available

There is more to share in the **Solutions** section of the Beep Brief (see Beep Ban; Solution #2), but my viewpoint is that if/when the CSA discontinues Embedded Commissions, the Mutual Fund Manufacturers and Sales Channel will have to get very innovative as they've had the good Beep life for 30+ years. Uber-like disruptive solutions and Robo inspired innovative FinTech platforms are coming; until a Bear market surfaces.

Nothing moves in a straight line. Bulls and Bears are conjoined. And the lack of Advice in a Bear market will be catastrophic as more and more Boomer have invested in the Equity market, and interest rates up/down will affect the Bond market. Canadian's need Advice, and they are not receiving it at present, because if they were, the Asset Mix of Mutual Fund investors would look more and more like that of the HNW at IIROC based firms; where capital preservation is a concern.

But no Mutual Fund Advice means Commissions only, and Commissions Laundering, as the 2nd 100 Beeps would not be deductible if the Mutual Fund Sales Channel had Commission based accounts (vs. Embedded Commission today). Or if you paid the Mutual Fund sales person directly, it then be a Commission.

After-thought. The 'Advice Gap' has been bantered about in the press as a 'hole' where upscaling the Mutual Fund Sales Channel would leave small investors without Advice. Robo's will address this marketplace. The real point is that there won't be free Beeps to the MFDA-licenced Mutual Fund Sales People any more. The small investor (aHNW) will probably be 'moving up' with respect to Advice + Service when they deal with a Robo as there is a Portfolio Manager and Discretionary component to this Beep-based channel as well.



Quick Summary (from an email I typed to a friend), regarding Advice

Oxymoron: Mutual Fund Advice

3Points

Point1. IMHO 'Advice' has to include 'Sell'. If you're not Selling, and only Buying, as in Buy&Hold, then that's a SalesPerson. It's the new KYC – Know Your Commission. Plus 'Selling', perhaps through Rules-Based-Investing (ie. Buy&Rule ®), allows you to take profits and minimize losses. That's why Investing is Buying&Selling. Just Saving, approximated buy Buy&Hold is a Sales-effort, from a Sales-person (proprietary offering or not).

Point2. What is Advice? The definition of Advice? It cannot be FinPlan because we know that is not deductible. So if you had to contrast Advice vs. FinPlan (from a Mutual Fund or Bank Teller's standpoint), I'd think you see that everything is FinPlan or a Sale. Holding a Balanced or Conservative or a Diversified or a Seg Fund or a Target-Date Fund, based on a Pie-Chart, is not Advice. It might be that the Mutual Fund industry is terming 'un-licensed FinPlan advice' as Advice. But it is still non-deductible by the CRA; if it is a FinPlan then it is a FinPlan (whether you have MFDA or CFP designations).

Point3. Licencing matters. We might as well say there is no Advice unless you're CSC-ed and IIROC-ed. Therefore investors via MFDA and other Proprietary Product sellers (ie. Insurance, Bank Tellers, Investor's Group, MD Management, etc …) are getting no Advice unless the person in front of them is CSC and/or IIROC. And the counter-point is that there are IIROC-licensed individuals who are dumbing down their offering, becoming relationship managers, and just acting like MFDA or FinPlan folks. That's a shame as well; 'Bad' IIROC Advisors.

No Advice means Commissions and thus that is Commission Laundering. Sure, the eHNW, HNW and UHNW, who are still in Mutual Funds might feel as if they are getting paid special attention because of their AUM, but it is still not Advice. Perhaps the challenge is to assume everything related to an Embedded Commission is not Advice, and let it be proven otherwise.

Or perhaps unless you can sell all the products, ie. ETFs. Stocks, Bonds, etc … your offering is termed a Commission (that gets Laundered in the current system).

BONUS Point – DSC Month

In 2017, DSC Month, or re-DSC Month, will be October

Usually every month of the year is DSC month. But this October will be extra special as the Mutual Fund managers who feel threatened by the upcoming second half of CRM ½, and a lot of great new Regulations, will be under sales pressure when 3Q17 has completed. So, 270 days will have passed in the 2017 calendar year, sales figures will be calculated, and year end projections plus plus commissions (via T4A) and bonuses will be closer to being envisioned within a Mutual Fund Sales Person's personal bank account.

Or perhaps it will be DSC Month, just for the purpose of keeping your job.

The Mutual Fund sales people will be passing this message along to their Sales Teams. We may have started to return-to-the-norm in the markets, the press will remind us of October's market performance in an odd-numbered year, the Black Swan could be Donald's wife leaving him, USA GDP may be tracking above 3% or below 1%, and European elections in Germany and Italy will be closer (if not passed already). Italian elections might be the next Brexit.

So why will this October will DSC Month, or re-DSC Month? There will be a Social Explosion far worse than French's ketchup being un-shelved. It may not play out in the press, but the sales pressure to lock-in customers will go through a 'last hurrah'.

I'll present a few diagrams of possible industry turmoil and changes in the **Solutions** and the **Crystal Ball** sections of The Beep Brief. But the last chance to get mega Beeps, the biggest commission cheques possible, for the Mutual Fund Sales People (Managers and Teams) will be October (the sales cycle could close in November or December, but it will start in October). Decent weather, a mindset that isn't on Santa Claus, CRM3 possibly to be enacted in the Insurance Industry in early 2018, all will drive the frenzy. The weak Sales Person performers, and the lowest 1 or 2 quartile performers, may find themselves selling Real Estate.

Summer will be slow, but in September the marketing campaigns will start in earnest. ETF fees will be shining a light on Mutual Fund Marketing (and associated HR staff). And door-to- door tactics will be employed; the ability to 'Say Anything' to get Beeps will surface. Insurance has already moved online and underwriting below 55 is no longer required. Lots of multi-channel competition with Robo-Advisors, all based on 3Q17 performance numbers and knowing that 2018's RRSP season is right around the corner.

The Beep Battle will be on center stage. This might be the last year of Easy Beeps. 'Say Anything' to 'Sell Anything' and lock-in Beeps will be the marching orders. And DSC's offer the best payout Commission payout (to the chagrin of the Canadian Investor).

"I'M HAVING TROUBLE SLEEPING, ROB. DO YOU THINK YOU COULD EXPLAIN, ONE MORE TIME, HOW YOU PICKED OUR MUTUAL FUNDS?"

Summary (before Solutions are presented)

Stop the Construction.

It's actually Destruction … to Canadians Wealth.

Ending Embedded Commissions will reduce Titles and move assets to Robo-advisors. Please see the **Crystal Ball** section after **Solutions**. You still solve a ton of problems in the industry including Best Interests and Titles. And Seniors can still have Commissioned based accounts, make 5 trades/year, and get GICs, T-Bills, Rate-Reset Preferred Shares, etc … from IIROC-based advisors.

The investment Style practiced by the Mutual Fund industry is Buy&Hold. But this is really Buy&Keep-paying-me-my-Commissions. Investing is about Buying and Selling, Buying good quality assets when they are undervalued and Selling them when they are overvalued (in general). But in the Mutual Fund arena there is no Selling and it isn't their limited licensing (MFL – Minimal Financial Licensing) that encourages them to turn a blind eye to Selling, or their lack of product availability/choice, it's their Commission plan, the Beeps, that encourages Mutual Fund Sales People to sell the Most Expensive Fund with the Highest Margin (proprietary products) with the Highest Commission. Embedded Beeps, with DSC's, rule the day.

'Say Anything' to 'Sell Anything' with High Beeps is the mantra.But the overall thesis of the Beep Brief is these 2 main Points:

Mutual Funds are a commission-based scheme masquerading as a semi-liquid asset class.

The Mutual Fund Industry is guilty of Commission Laundering

And this Bonus Point

In 2017, DSC Month, or re-DSC Month, will be October

I applaud the CSA for this undertaking regarding discontinuing of Embedded Commissions. They have done their home in CONSULTATION PAPER 81-408. There are many facts and a ton of details in the 169 page document.

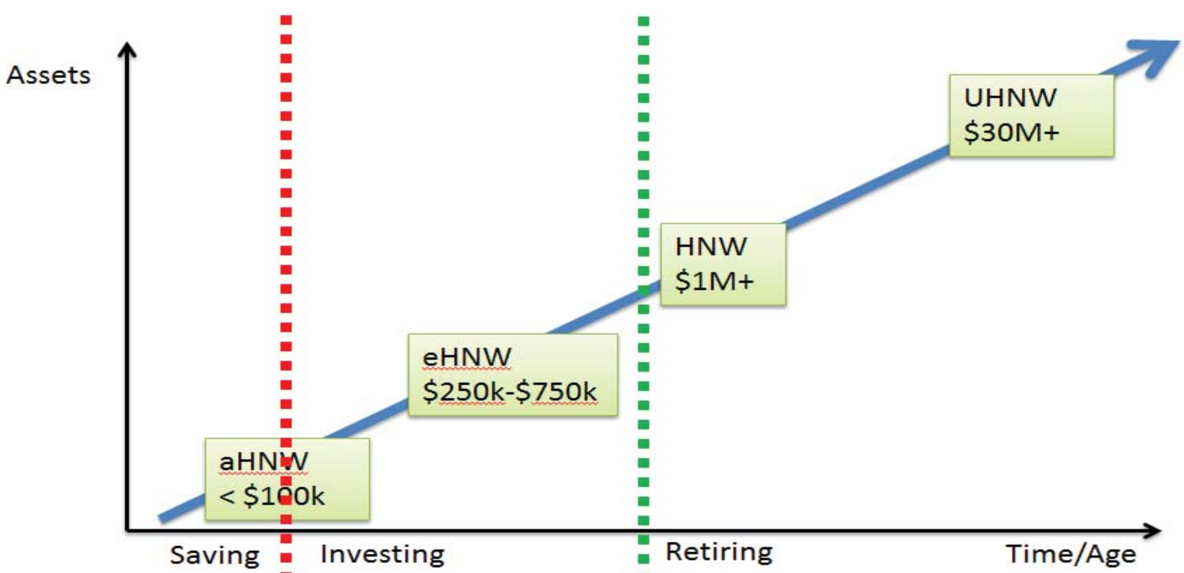
Removing of Embedded Commission enhances the Canadian Investors' Liquidity. And Liquidity is good for Best Outcomes.

I know it is scary for the Mutual Fund industry to accept the removal of Embedded Commissions, change always is.

And that reminds me of this visual.

Do you know what this chart is? To me, it looks like nothing moves in a straight line and within the up-sloping Trendline there are Ups & Downs along the way. I'll give you a hint, it's almost a 20 year period, of an Index, that is near and dear to Canadians' hearts ♥. It shows there are times to Buy and times to Sell, and there was also a 10 year flat period as well. And this is on the Home Page of www.TrustedWealthProfessionals.com as well. Do you know the Index?

There have been ill-advised wording changes recently by the Mutual Fund industry, one of them is 'Investment Funds' replacing 'Mutual Funds' (it really means Beep-generating Funds). It reminds me of conversations I've had in the Pension marketplace about people who will 'Say Anything' to get Beeps for AUM (Assets Under Management). At some point Canadian's will transition from Saving to Investing. And then at a later point, they'll move from Investing to Retiring. As they traverse these 3 stages, they'll need Growth, Growth+Income and finally Income from their assets. I've arbitrarily depicted this below, in the HNW Spectrum graph I portrayed earlier in The Beep Brief.



And Canadians' can't keep losing Beeps to the Sales Channel. Beep Preservation is paramount as Canadians will need to keep in mind these 2 emerging facts:

1. The Government cannot look after you, to your current standard of living.
2. You'll need more money/assets than you think. Whether it is because you're living longer, or inflation, or whatever. You'll need more money/assets.

So the opportunity exists now to Rule Your Wealth.

And I don't agree in its entirety with the argument that Canadians need to become savvier with respect to their financial choices. The Wealth industry has to be presented to Canadian investors in such a way that the correct Choices, and Best Outcomes, are the default settings.

If you consider a food supermarket, any one of the larger chains will do. You walk in with cash (or a debit card) but no credit card, and in any aisle there are all the products side-by-side, with Nutrition labels (albeit still confusing). Your health choices have now been narrowed down for you. So have your spending limitations. Gasoline prices are generally 'displayed' so as to be seen from a distance. Store flyers, online or in a newspaper, are everywhere; there are specials, there are sales. But in the Financial Services sector, the overall Wealth industry, there still is mystery, hidden costs/fees, a non-transparent Embeddedness, that does not serve the Canadian consumer/investor. This leads to Beep Profiteering. And it creates sub-optimal outcomes for Canadians overall.

Canadians' need Investing Liquidity. They need Fair Choice. They can't deal with all the Schemes and Billing Systems. They need Advice, real proper Advice. Without Conflicts of Interest. At present, en mass, Canadians have the Wild Wild West of Products & Fees, with no real Service or Advice defined. The last I heard was 23,000 Advisors, with over 20,000 securities, creates a mind boggling array of investing Permutations and Combinations. Note: I just saw 120,000 'Advisors' mentioned in a CBC article on Sales Practices at Big Banks.

Ironically, the CSA has an opportunity to provide Leadership to this plethora of Choice + Customization by making the default option the Best Possible Outcome (see Solution #1).

But as an industry-whole, the Mutual Fund Fees can be formulized to be:

No investment Advice
+ Various levels of Service/Statements
+ Embedded Fees/Commissions
+ None-to-Great levels of FinPlan (Financial Planning)
+ MFL (Minimal Financial Licensing)
= Commissions Scheme

Don’t let the Advice BS (Big Story) fool you, Embedded Commissions, in the overall Wealth industry, Financial Industry, the Insurance Industry, etc … are not in the Canadian investor’s best interest. Embedded Commissions affect Liquidity, and the denial of Liquidity affects overall Best Outcomes; evidenced by Wealth/Asset performance. Embedded Commissions does not equate to Advice.

Thank you again for your time and consideration when reading this Beep Brief. I do have enough material for the second phase of the Beep Brief, but that is for another day.

I'll get on to the Solutions now.

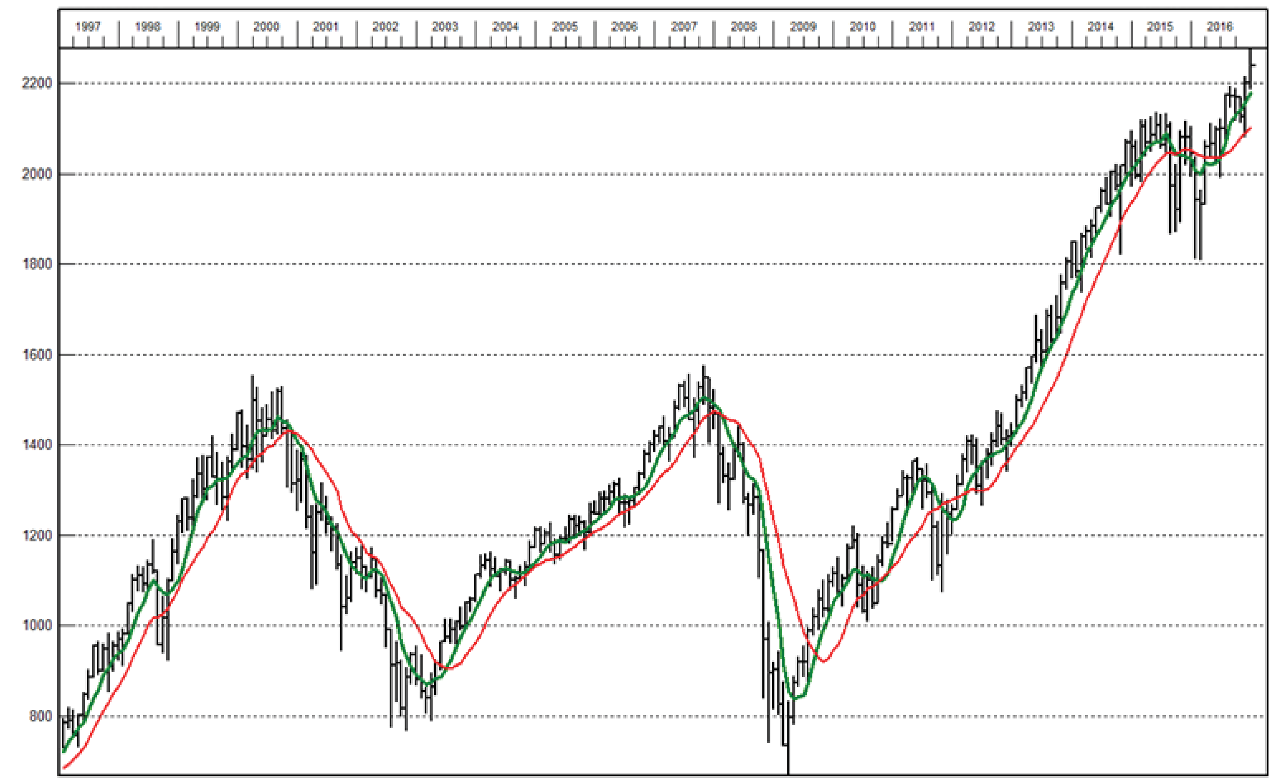
And thank you again for your time.

Solutions – Before the Crystal Ball

Solution 1 – Must see IIROC Advisor in order to receive CPP and/or OAS

One Bear market, will diminish Canadians Wealth drastically. And stress all levels of Government. The quasi-Bear market could be a return to the 'norm' slowly over the next 5-10 years; that's stagflation. And again, stress levels of Government.

Was the Mutual Funds Sales Person's Advice, or Mutual Fund company's Advice, ever to get out of the market? Do they really want Canadians to participate fully in a 54% decline; last evidenced between 2007-09? Or a Dot-Com rise into a decline of 49% during the Dot-Bomb?

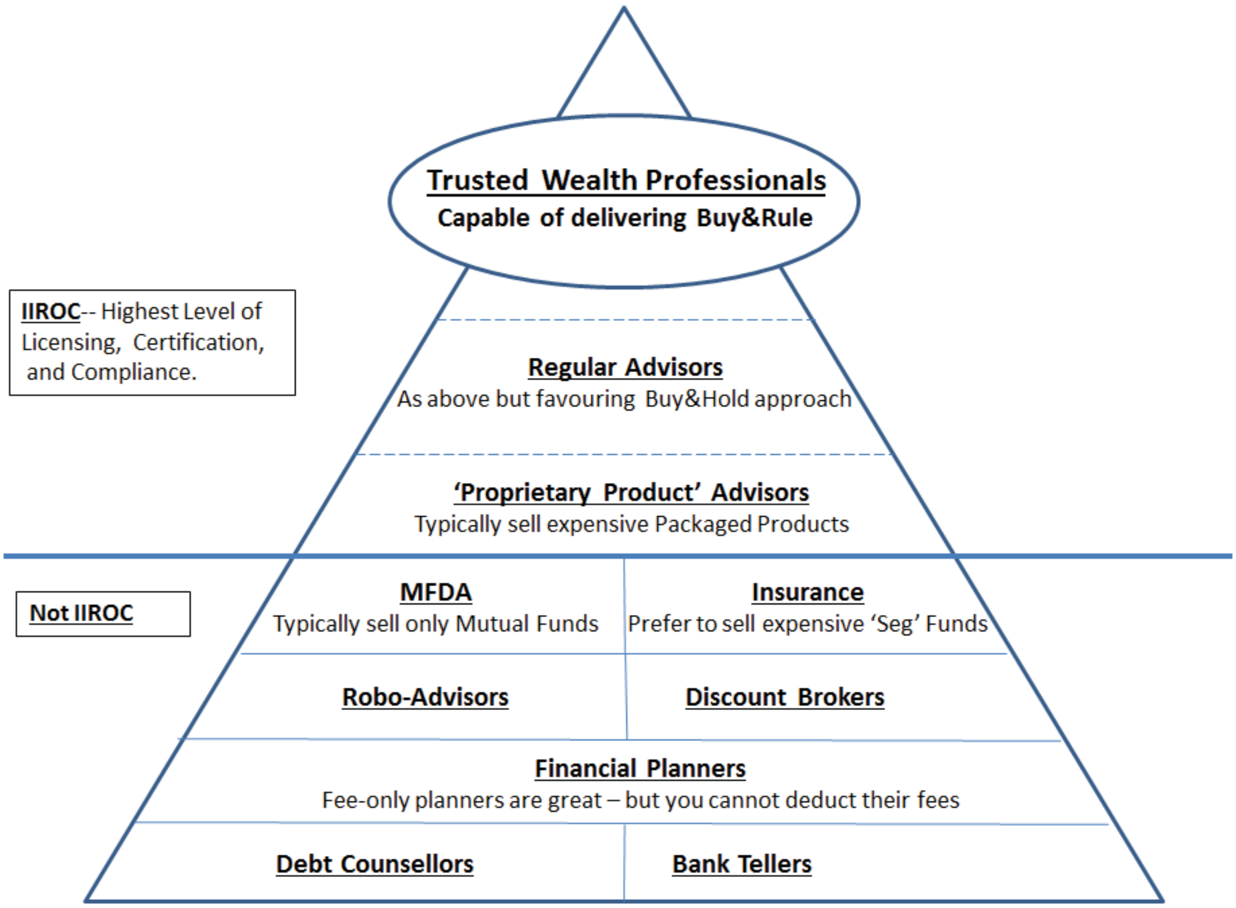


I'm not fear mongering, I'm just illustrating history. In the chart above, over the last 20 years, there have been two major Bear markets. The market moves in Bulls and Bears. It goes up and down. It doesn't move in straight lines.

A new law/regulation is coming. Mandated by the Government.

If you're entitled, and you want your CPP, and OAS, you must go see a full-service IIROC life-licenced non-proprietary investment advisor. Every 2 years. Starting at age 55, maybe age 45, or when your investible assets (across all accounts), surpasses $100,000.

Note: Average 'book' for an IIROC advisor is $150M across 150 'families', so $1M per account. This is the type of advice/service that we want to connect with Canadian investors.



Note: TWP Triangle explained in Solution2

OK, bold and new and innovative thinking, Yes. Scary to a lot of industry participants at present, YES. But if you have an emissions check on your car every 2 years, and a principal residence designation now on your tax return, etc ... it's an easy extension. The government, so that is Justin, Bill and Stephen on a Federal level and Kathleen plus Charles on the Ontario Provincial level, mandate that you must signoff on a bonafide visit/consultation with someone that can open your eyes to all the investment products and services. And perhaps all the investment styles. And Fees aussi.

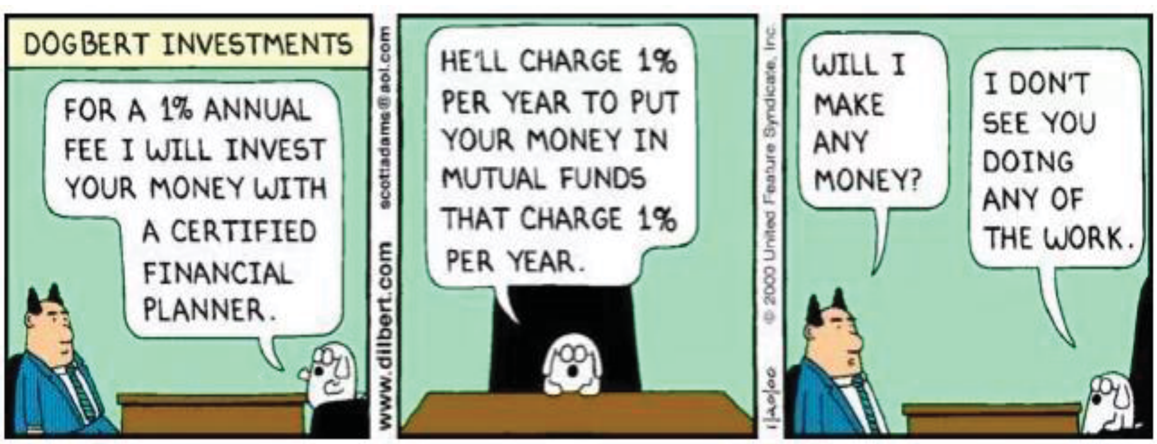
Re-Cap: If you want/need your CPP + OAS go see a Trusted Wealth Professional (TWP). A full-service IIROC life-licensed investment advisor. Not MFDA. Not insurance. Not a Financial planner. Not a Debt Counsellor. And not anyone from your bank (ie. Teller).. And not a wannabe 'bad' Full-Service advisor (who jiggles or trades on Mutual Funds based on the sway of a free lunch from a Mutual Fund company). But rather a true TWP who can practice capital preservation and understands the usage of Tactical Asset Allocation. A true TWP who can go 100% cash (or equivalents, termed 'Cash/E') if the investments + market dictate so. I can sit in

100% cash/E in my accounts – can you? The next best option is to slide to the safety-end of your IPS ranges (ie. 10% equity if the range is 10% to 60%). An Investment style of Buy&Rule ® inherently includes the needed 'flexibility' and appropriate Licensing.

Why? We are increasingly every day so much more dependent upon the government to look after us. It's astounding. And despite a few great ideas I have to change this dependency, I can't cut this umbilical cord. But the Government, at all levels, needs to make sure that we Canadians grow up and can look after ourselves. And we can't do it ourselves with the Up-Selling, Cross-Selling, Locked-In Products (proprietary or not), and Beep-based schemes within the overall Wealth/Financial sectors.

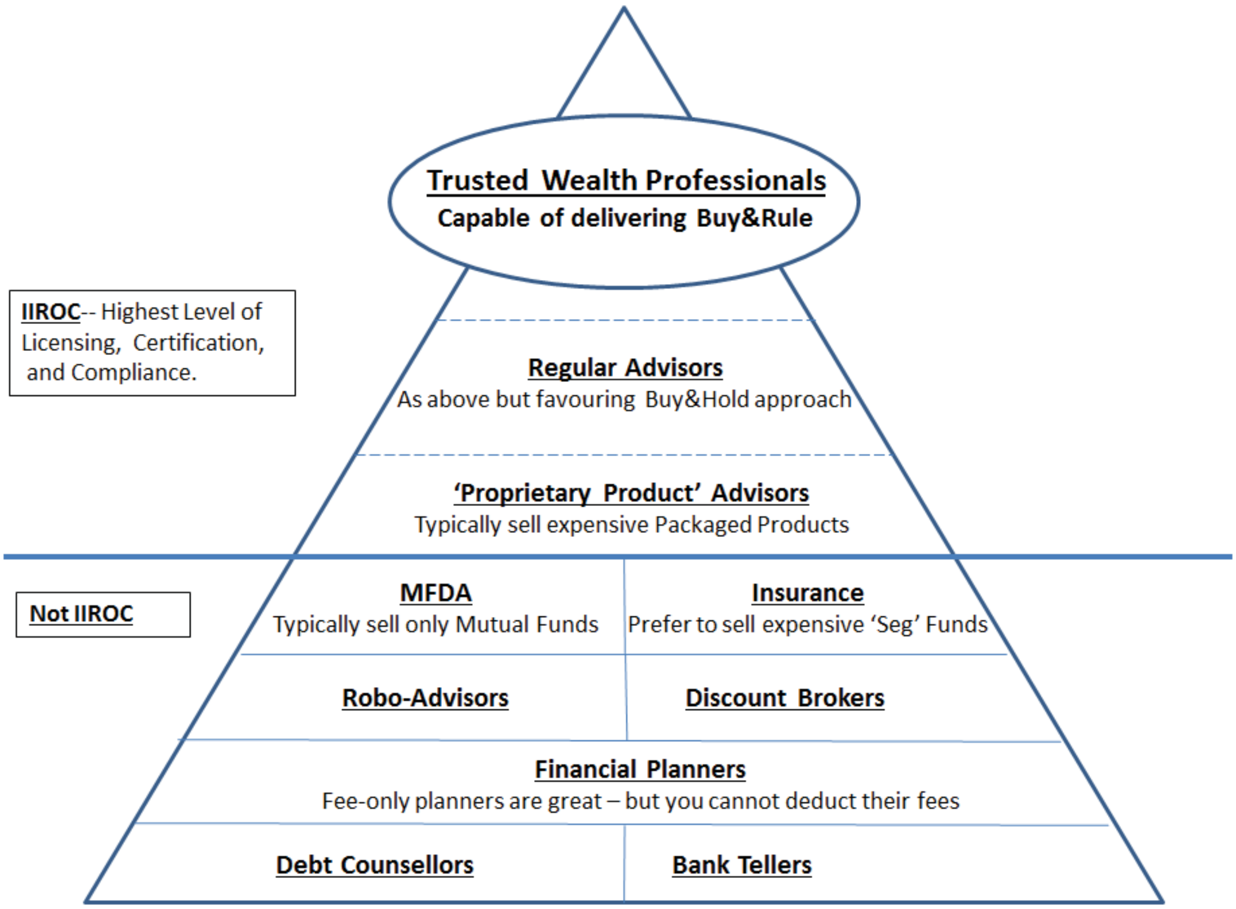
If a bank owns a full service brokerage firm, then minimums should be set for mandatory in-house referrals; from the banks themselves, their insurance arms, bank-owned discount brokers, Robo's they own, etc … to full-service brokerage IIROC-licensed firm they own. As an aside, I've been told by the smaller IIROC firms, that this is where they 'pick off' the majority of their clients/assets. Banks with Tellers are far from well versed to deal with a small independent IIROC professional firm. Holding AUM at the bank branch is a short-term asset-grab as the bank will lose the AUM to their small IIROC firm competition (eventually).

Solution1a: if you don't meet the criteria for Solution 1 above, then you probably should visit with a Debt Counsellor, if appropriate, and also stop financial institutions from growing the Canadian individual's debt levels as well. Why give a new credit card, or HELOC, to someone who already can't make monthly payments, or is within $200/month from declaring bankruptcy.



Solution2 – Beep Ban

Just in case your eyes move towards the diagram below, I'll say it again, ban Beeps for non-IIROC licensed Sales Channels (or similar regulations). And this is a direct Sales Person connection, not one IIROC licensed person in your firm, in a city far far away, and/or a non-IIROC Sales Person dealing with the Canadian investor.



The diagram above is self-serving for Trusted Wealth Professionals. I know there are many other categorizations of 'Advisors', but from the Canadian investors standpoint, from those that have $10,000 (aHNW, aspiring High Net Worth), and through to the $250,000 level (eHNW, emerging High Net Worth), this is a sufficient distinction. The HNW already know who a trusted wealth professional is.

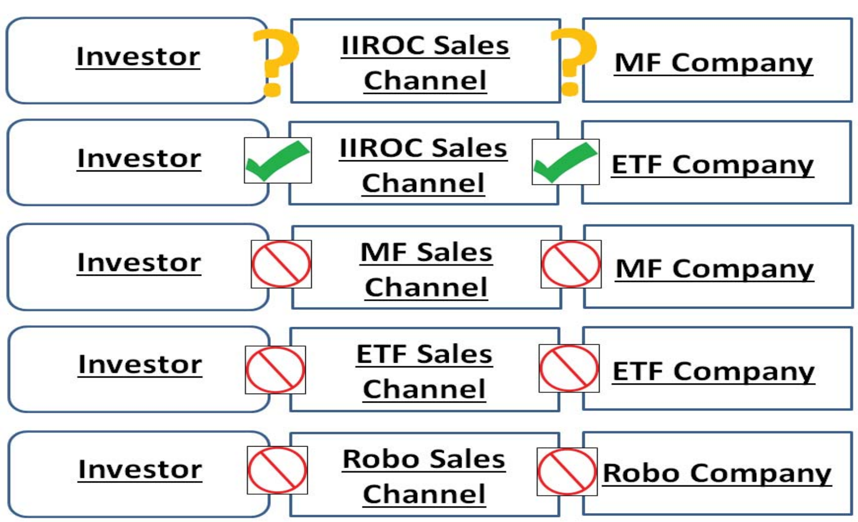
And perhaps with an admittance of the overuse of the word 'Beep' in the Beep Brief, I'll admit that, but the Embedded Beep Scheme has led to greater scrutiny of the Mutual Fund Sales Practices.

So, what would a Beep Ban look like? Essentially, you can't share Beeps amongst multiple parties and you need to do 'work' for your Beeps. You can term 'work' as Advice or Service, but I'll re-mention that your 'work' must be that of an IIROC advisors. And yes, there are IIROC advisors who only do the 'work' of the MFDA Mutual Fund-licensed Sales Person (but I can't provide that detail in this Beep Brief, but it is sad that there are 'Bad' IIROC Advisors).

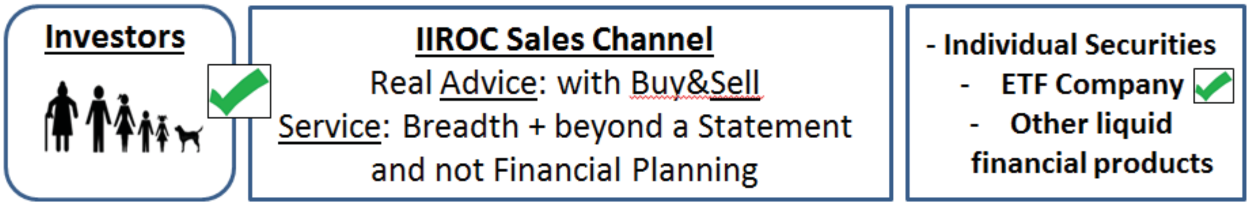
Beep Ban

1. Don't allow Beep pricing for non-IIROC advisors. Ban Beeps for the MFL; Minimal Financial Licensing (ie. MFDA, Insurance, etc …).
2. Don't allow Beep pricing for Insurance wrapped investments.
3. Don't allow Beep pricing for any entity/advisor that doesn't Buy&Sell themselves. If they are just a middle-person, flat bonus compensation systems will suffice.
4. Ban Beeps for any type of Sales Channel and Ban Beeps for WealthCo's where Accountants, Actuaries, Lawyers, Fee-Only Planners, etc … try and receive Beeps from the HNW clientele. There will be emerging Wealth Companies (WealthCo's) that will create pricing structures to extract the most amount of money from their clientele, and some of this will avoid the Fee scrutiny of CRM ½ . The first instance of this is Financial Planners (including Fee-Only) and Accountants, referring HNW clients to mutual fund firms and participating in the Mutual Fund Beeps. And this is starting to emerge in the Robo marketplace as well. The same referral arrangement exists in the Insurance marketplace (but you need certain licensing for legitimate referrals).
5. Only 1 Beep-biller per aHNW, eHNW, HNW and UHNW unless you have the requisite Licensing/Service/Advice. And any Beep sharing must be disclosed in writing (Beep referrals, Beep splits, etc …) and additional waivers signed showcasing the nominal and percentage amounts per annum.

Just a simple way of illustrating the Beep Ban is portrayed below. But let's not forget about the Canadian investor and the Investments + Liquidity.



It might be better to look at 'OK Beeps' with this diagram



Advisors who flip Mutual Funds, or Advisors who charge more mutual funds in a Fee-based account, should would be excluded from receiving Beeps. Please see Addendum 1; the beginnings of a Bad Advisor Blog.

"The weakest kind of referral, of course, is the lead capture"

You shouldn't be receiving Beeps for passing along someone's name. Or a similar weak effort.

<u>Solution3 – No Insurance + Investment mixing/wrapping</u>

Don't allow the mixing of Insurance with Investments (ie. Seg funds). Don't allow insurance 'wrappers' around Robo's offerings or offerings from other investment companies (for the purpose of minimizing regulation). Or delaying the removal of Embedded Fees until the second half of CRM ½, or CRM3 for the insurance industry in 2018-19, is delivered.

<u>Solution3a</u> – Seg Fund's have an 'advantage' as Investments bypass Probate tax. If the CRA and related interested parties (Justin, Bill, Stephen, Kathleen, Charles) care about tax revenue, they'll address the arbitrage advantage of Seg Funds, and the $15 tax per $1000 assets (please do not use 1.5%, people can't do 'percentage' math). Take away the Advantage, so you can't wrap Investments with insurance, and purposely avoid paying tax. This could be a great revenue source for the CRA. Keep in mind that Canadians are living longer, so more fees are generated by these Seg Funds and greater Nest-Egg's are accumulated. Why allow an investment to bypass Probate?

<u>Solution3b</u> – Make Seg Funds, for those Canadian investors' that really need them, based on ETFs only (no manager turnover, cheaper, etc …). So you'd have Seg ETFs. Possibly look at Target-Date ETFs as well (no holding underlying mutual funds).

It might be easier to discontinue Seg Funds.

Solution4 – Benefit Plans
Corporate Benefit Plans ie. For example, your employer matches your 3% with 3% of their own. No more Mutual Funds; need go to ETFs. Separate the investing via RRSP/Retirement-Plan, from your Dental/Vision plan (generally offered by an Insurance Company). And provide Liquidity by being able to transfer (perhaps 1x/year, or 2x/year, automatic (?), to a Full-Service IIROC, Discount, or Robo). Make it easy for this to happen, perhaps mandatory.

Solution5 – Define Advice (in a clear and differentiated manner)
This is a joke I thought of:

KNOCK KNOCK
"Who's there?"
"Mutual Fund Sales Person"
"I thought you guys only KNOCKed once a year… when it was RRSP season?

The sad thing is that most Mutual Fund Sales People only call 1x/year, about mid-February timeframe, to ask for more RRSP dollars. And they call this Service/Advice. ☹

The opportunity exits to define Advice. And Advice Tiering. Plus define Service.   Advice is not a Financial Plan. There has to be an aspect of a 'Sell' (IMHO; in my humble opinion). And transacted themselves by the 'Advisor'. Buy&Hold is not Advice, nor Service. And this needs to be Standardized across the entire industry. Plus approved by the CSA/OSC and the CRA. It may be that non-IIROC companies/Advisors will never be providing Advice.

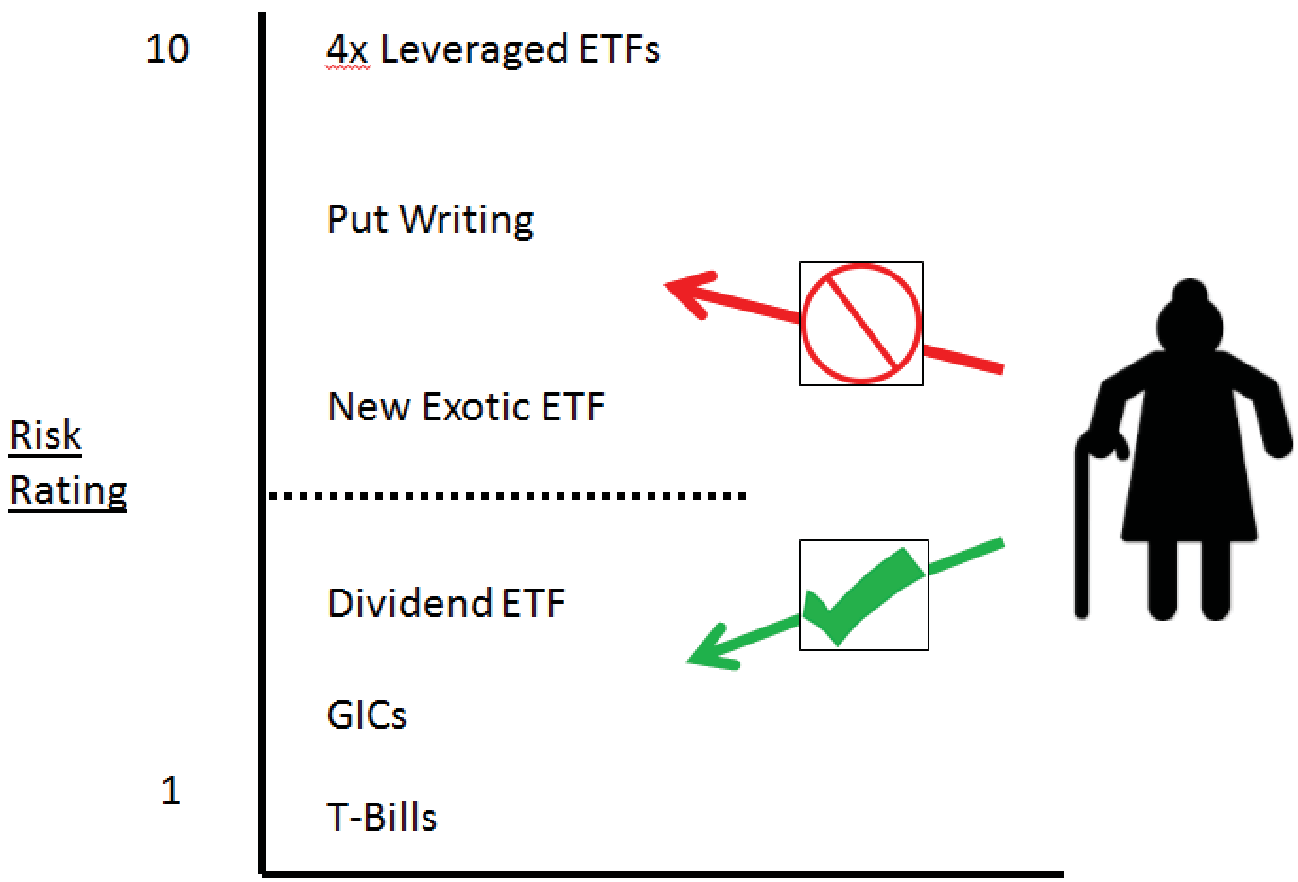
	FinPlan$ & Description (nondeduct)	Commission$ & Description (nondeduct)	Service$ & Description (CSA apprv.)	Advice$ & Description (CSA apprv.)	Other$& Description (CSA apprv.)
$0 to $10,000					
$10,001 to $50,000					
$50,001 to $100,000					
$100,001 to $250,000					
$250,001 to $500,000					
$500,000 to $1,000,000					

Solution6 – Security/Product Risk Ratings

There should be Tiered Risk Ratings for Products. And for Tiered Risk ratings for Seniors, you can't cross the line (see image below). And if you can't BackTest the product through an entire market cycle (so Mid-2007 was last Peak), and if it didn't exist through this time period either, then it is too risky (high risk rating or non-rated; sign an additional waiver if you want this).

If the Mutual Fund doesn't create an 'S' class fund for Seniors, and an 'M' class for Millennials, then they might as well be in invested in ETFs. Actually I don't think either of these will occur (maybe I'm wrong), so perhaps you should just invest in ETFs regardless.

But I read a good point that Seniors that shouldn't be in Mutual Funds because they've already paid high fees their entire investing life. So, if no 'S'-class Mutual Funds, go to ETFs.



If you happen to examine the Judgements from the Complaint process, that are in the press, you'll often understand that Canadian Investors' being placed into an inappropriate/risky product is prevalent more than 50% of the time.

Solution7 – Standardized AUM Grid

Need standardized industry-wide GRID for AUM-levels – so, $0-$250k, $251k-$500k, etc … Or whatever levels are chosen to discern smaller accounts and then larger accounts. This is just an example below. Every financial institution has to use the exact same ranges.

$0 to $10,000
$10,001 to $50,000
$50,001 to $100,000
$100,001 to $250,000
$250,001 to $500,000
$500,000 to $1,000,000

Solution8 – Standardized Investor Fee Interface

I don't think the Regulators should get into the 'bedroom' of Sales Management. Me: I've been on the Sales side of Hi-Tech solutions for 30+ years. I've been a quota-bearing sales representative for over 10 years and also consulted in this regard for the last 15 years. The complexity within the compensation plans at major hi-tech firms (e. Nortel, Oracle, Microsoft, etc ...) would astound you. Especially with their compensation plans for their different channel structures. Complicated and convoluted. I think the Regulators should stay out of this area, but please keep in mind that everything the Canadian investor sees as a Billing System means that there is a synonymous Compensation System for the Sales Person/Channel. This gives rise to KYCP; Know Your Comp Plan (aka. "Where do my Beeps come from"?).

But there should be an IFI, IPI or ICI – Investor Fee Interface, Investor Pricing Interface or Investor Commission Interface, just like a GUI (graphical users interface) or UI (User Interface) or UX (User Xperience). Focus here, not inside the company, but external between the Investor and the Company. Just like 13% HST in Ontario, your cost is known, it is clear and it is

1-time. And it is standardized across all retailers. What is and what isn't taxed (necessities) is known, the Mutual Fund industry thrives on the 'not known' (ie. Embedded Beeps).

Solution8a
Need consumer acceptance of **ALL** new pricing schemes; through public + industry consultation.

Solution8b
Need consumer acceptance of **ALL** new products; again through public + industry consultation. It's too difficult for the Investor to learn KYP; Know Your Product. Or, KTPWJMU; Know The Product We Just Made Up.

Solution9 – Lower Price is the Law
Test annually (or semi-annually) the total cost of Fee-Based vs. Commission accounts. If lower in Commission accounts, possibly move Investor to a Commission account. Or sign waiver (and state 'Why' you aren't switching). There are Pro's and Con's to this as different IIROC Advisors may not be capable of managing Commission based accounts (ie. the 'Bad' Advisor).

Solution10 – Can I have a graph please of my Asset's Performance
My personal #1 priority is the industry need graphs in statements; visuals. Robo's are winning in this regard. Ironically at Financial Models, 17 years ago, we could show a pie-chart, or any chart type, of your assets, holdings, etc … The software was Financially Intelligent. This should become mandatory as 85% (or more) of the population processes visually.

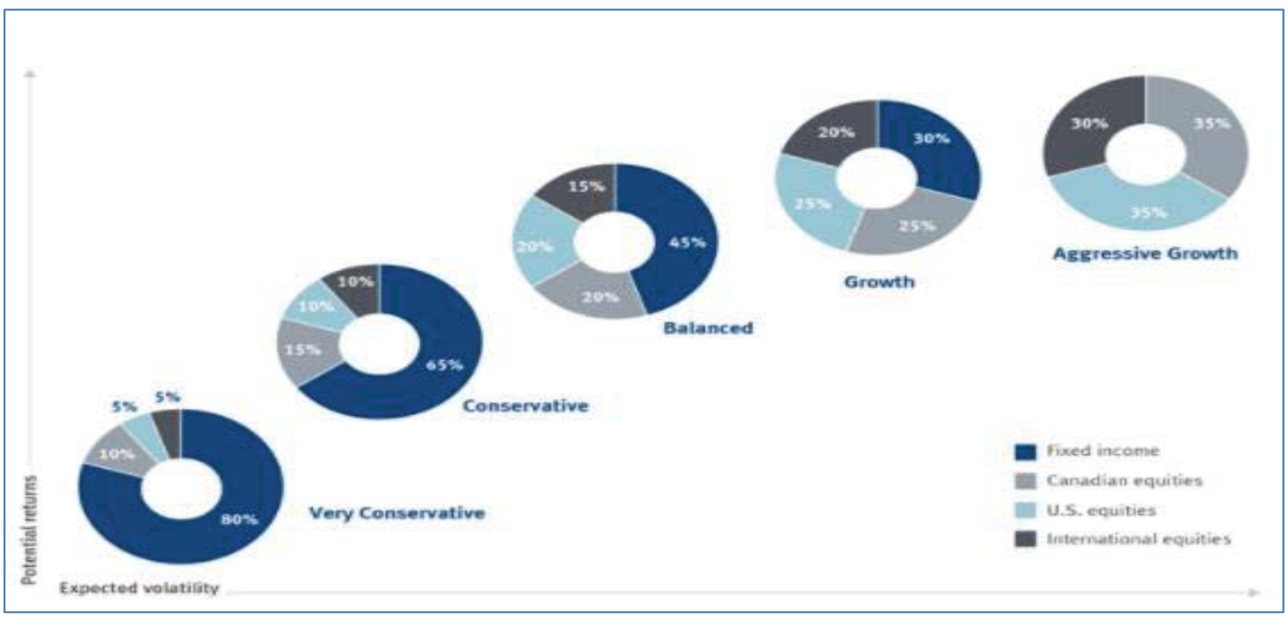
Solution11 – Risk Profiling needs a complete overall

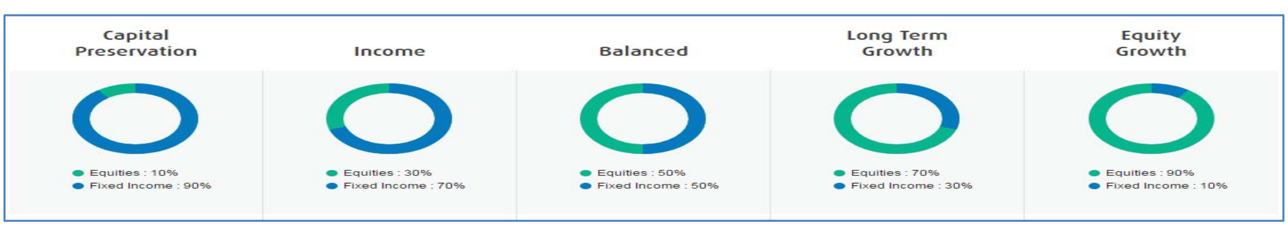
Risk Profiling in KYC's and IPS's is horrendous IMHO (in my humble opinion). There is a great need to have actual market examples. And proposed securities/investments as well in the Risk Profiling. The KYC and IPS is done in absentia of investing ☹. And please use standardized terms.

Did I tell you about my own Mystery Shopping experience? I planned on booking 'investment' conversations with 5 of the major banks. The idea, just walk into a bank branch and tell them I want to invest. I literally said that I was investing directly already but wanted to see how the branches programs with portray me and classify me with respect to 'risk'; I was after the proverbial pie-chart. I wanted to go through their Risk Profiling questionnaire.

I only actually went to 2 of banks. Both turned out to be 'product sales'. I'm OK with that, I actually expected that. The 'sadness' of the experience was that at one of the banks, their 'top' Teller, a salesperson, with a planner designation (CFP I think), asked me two times to change my 'risk answers', and actually did present to me the option that she was quite familiar with (the one question where she wanted me to change my answer). I was honestly flabbergasted, the lady tried to have me change my answer, and it made me think she didn't know the talk track to the other options. It was the question somewhat worded "If you invested $100,000 and it dropped to $90,000, what do you do?" Then there were 4 multiple choice options; A, B, C and D. I picked option C but she only knew the answer to option B ☹

<u>Solution11a</u>
The Pie-Charts need to be standardized for Canadian retail investors. There are three Pie-Chart series presented below; all with different order and naming conventions.





And actual market investment 'visuals' matter. The Primer below is an example of poorly communicating 'risk' and 'reward'; borrowed from a CIBC website. Read the words.

A Primer to Market Downturns

Be the first to write a review

All market slumps are not the same. Here is how to recognize different types, and what they mean.

If you're like many Canadians, you've been getting nervous about your investments because of the rapid up-and-down swings of the stock markets. To help you understand and cope with these market swings, let's take a look at the different types of downturns.

Declines

A decline - usually lasting a few weeks to a few months - is a short-lived sell-off by investors in reaction to some unexpected bad news. An example was the 554-point drop (a 7.2% decline) in the Dow Jones Industrial Average, one of the most closely watched indexes, in October 1997. Fears about how the weak Asian economies would affect earnings expectations in North America resulted in significant "knee-jerk" selling. Soon, however, the Dow adjusted itself, and it ended the year higher than it had started.

Corrections

When a decline approaches the 10% level over a short period of time, such as a few days, it's usually considered a correction. Corrections can be caused by significant increases in interest rates, reductions in overall economic activity, or perceived overvaluations of stocks. A severe correction can occur as a result of a particularly negative political event. For instance, the Dow fell 21.2% over a three-month period after Iraq invaded Kuwait in August 1990. Interestingly, in a study of the Dow's movement since 1900, Ned Davis Research, a financial research company, found that severe corrections are followed by "bear" markets 58% of the time.

Bear markets

A bear market is a prolonged period of declining stock values that can last a year or longer. The market is considered "bear" when stock prices fall about 20% or more and stay down. Broad economic factors, such as unfavourable interest rates and an economic slowdown, trigger a self-perpetuating spiral of selling. This is in contrast to a "bull" market, which is a prolonged period of rising stock value.

Crashes

Much less common than the above is a crash, when stock prices drop more than 10% in one or two days, resulting in severe sell-offs by scared investors. Only two crashes occurred in the last century: The first was on October 29, 1929, and the second on October 19, 1987. Usually, a crash is caused by a dramatic reversal of basic market assumptions. Although not a "crash," the financial crisis of 2008 caused the Dow's worst-ever week: Starting October 6 of that year, the index fell 18.1%.

Whether it's a brief decline or an extended bear market, you can use some simple strategies to see a downturn through. A long-term focus, combined with a well-diversified portfolio, will ensure that the bumps along the way don't derail your plan.

Read the 'spin' in the Primer above. Contrast the longevity terms; days, weeks, months, etc … Read the actual numbers and 'example' numbers. And keep in mind that 85% of people process visually.

As unfair as this will seem, but do any of the Marketing personnel have degrees/certification in financial services. Better still, are they Licensed? And I'll go one step further and say that the Compliance department approved this. ☹

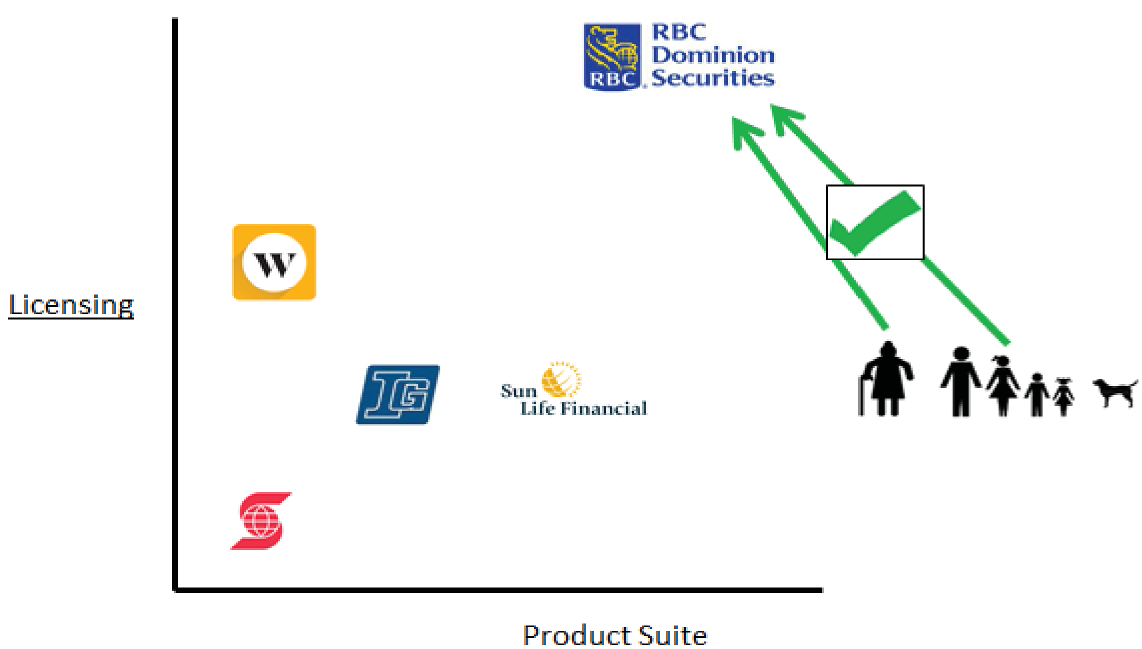
Solution12 – Make the default case the correct case.
Discount brokers selling Mutual Funds; A-Class and F-class. Possibly limit to D-class or just remove Mutual Funds from their offerings. Curtail their Product Suite offering to only ETFs. I think Discount Brokers will start branding themselves now as Ethical Compensation brokers; at present they are not doing themselves a service by collecting A-class or other Trailer fees

Solution13 – Rate the Advisors
Advisors should have a Risk Rating. 100% Yes. My Advisor makes a difference, does yours? Investment Style matters as well. Just off the top of my head:

- Your tenure in the business, in years, or your Mentor team's tenure in the Investment busines? Note: Investors Group, 4 years of experience is not 'Senior' advisor.
- Have you experienced a complete market cycle? Started pre-2007. Have you seen a period of rising interest rates. Started pre-1985?
- Can you handle a Commission based Account? Really? Even if it means less compensation to you?
- **Licensing matters**, where are you on the Licensing Ladder, at the bottom? Are you part of the MFL?

And there are a few other 'choice' questions I have to determine if an Advisor can be Trusted or not. But the Investor should also sign off on the fact that they've seen the Advisor's Report (on IIROC's website, or any other official Regulatory website).

Solution14 – Industry GRID
Should be an industry product GRID that distinguishes limited product sellers and proprietary product sellers. And it will be Cross-referenced with licensing. The starting point will be Product Suite vs. Licensing. Investor's must signoff on this.



This will show who has Minimal Financial Licensed (MFL) representatives (ie. major Canadian banks). You could also explicitly show Cross-Referencing of Licensing with Proprietary Products. Maybe there should be an Open 'Book Look' to see what Products the Wealth Companies are actually selling; in other words, make it easy for the public to identify you as a Proprietary Product Seller. It be great also to cross reference this with performance over a complete market cycle. Hmmmm.

True Story – I actually heard my bank branch representative tell a client that the Brokerage firm "charges commissions". It was delivered in a Do-Not-Visit-Them tone. Sad ☹.

Sessions 8 and 9 of the Canadian Investors' Course on the Trusted Wealth Professionals website are as impartial and fact-based as can possible be. But it may be that Canadians need a bit of Leadership. And yes, this will come across as extremely self-serving, but in today's society where we are so enamoured by the Wealthy Celebrity, sports player, music artist, etc … why not showcase the Advisors that serve the wealthy?

TWP | Trusted Wealth Professionals

CIC

See **Crystal Ball** in the following section on how this can be addressed.

Solution14a
There should be a Menu of Products, for any particular category, a product GRID per se. This GRID would show all products with their total cost (total cost, not partial cost like CRM ½ or how the Banks are portraying their Services these – see Solution 15). Like a restaurant menu; you should see low priced entrees, medium priced entrees and the most expensive entrees. And/Or it should be signed-off on by the firm's management. Note: the GRID could look a paint-chip-strip as well.

<u>Maybe 3 Investment Options always need to be presented</u>; Low, Medium and High Priced.

Why? There are almost 3000 stocks on the NYSE, and 22,000 mutual funds (OK, there are a lot of duplicates, with A-Class, F-Class, D-Class, etc ..)

Horizons S&P/TSX 60 Index ETF charges 0.03% at present; 0.07% after September. Vanguard and Blackrock have similar priced ETF products that equate to Closet-Indexed Canadian Equity Funds (which charge a lot more). The Globe&Mail's website indicates there are over 1000 securities to participate in the Canadian Equity marketplace (way too many IMHO); 1237 to be exact at the date of me generating the following image.

Solution15 – Funds of ETF is not the same as buying ETFs

Please disallow Mutual Funds, primarily holding ETF's, and sold as 'ETFs.'; mainly by bank branches. These are really Mutual Funds, generally proprietary, with a new fee structure, the 2-Fee-Structure ☹. Innovative yes, I'm OK with that. But no-one at the bank branch has an IIROC license. Packaging 'securities', so they can be sold by Minimal Financially Licensed 'Tellers' is not in the Best Interest of Canadians.

And you need to do math + calculations to put MER + Advisory-Fee together.

*"All ETFs have management fees and expenses (calculated as management expense ratio - MER) which are in addition to the **annual advisory fee**. The MER is embedded within the pricing of the ETFs themselves and will not appear as an expense item on your account statement(s). The MER of the ETFs held within your portfolio are anticipated to be a weighted average of 0.20% to 0.35% of the value of your SmartFolio account."*

Note: Advisory-Fee does not mean Advice.

Our fees explained

Our commitment to you
Our goal is to provide clients with full disclosure with respect to the fees and interest rates they pay for certain accounts and transactions. This page outlines the range of charges you may incur, depending on the types of accounts you hold and the transactions that occur within these accounts. Any fees charged to your accounts will be detailed on your client statements. If you require any additional information regarding your fees, please contact one of our dedicated representatives at 1-844-895-3721

In general
- Fees are charged per account unless otherwise stated
- Accounts can be grouped by household to benefit from lower pricing at higher asset balances
- Fees are subject to change
- You will receive 60 days' notice for any new or amended fee
- No commissions charges on trades

BMO SmartFolio advisory fee:
Pay one advisory fee which is calculated as a percentage of your total assets in your BMO SmartFolio account(s). The advisory fee is charged quarterly in arrears and is based on average total assets in your BMO SmartFolio account(s) during the calendar quarter.

The advisory fee covers:
- Professional portfolio management including monitoring and rebalancing
- Support from a team of dedicated representatives as you need it

The advisory fee follows a tiered-pricing schedule based on the value of your BMO SmartFolio account(s).

Minimum Quarterly Advisory Fee $15

Asset value	Annual Rate
First $100,000	0.70%
Next $150,000	0.60%
Next $250,000	0.50%
Above $500,000	0.40%

The minimum quarterly advisory fee of $15 will be waived if you deposit $250 or greater in your account during that calendar quarter. If the minimum fee is waived, the tiered advisory fee schedule above will apply.

All ETFs have management fees and expenses (calculated as management expense ratio - MER) which are in addition to the annual advisory fee.

The MER is embedded within the pricing of the ETFs themselves and will not appear as an expense item on your account statement(s). The MER of the ETFs held within your portfolio are anticipated to be a weighted average of 0.20% to 0.35% of the value of your SmartFolio account.

For more information about the management fees paid by the ETFs in each ETF portfolio, please speak to one of our representatives at 1-844-895-3721.

Other account fees
Other fees apply for the administrative requests detailed below:

- Transfer-out of a Non-Registered or Registered Account, Full and partial: $135 per account
- Partial withdrawal of a Registered Account (excluding TFSA): $25 per request
- Full Deregistration of a Registered Account (excluding TFSA): $100 per account
- Cheque requests: $10 per request
- Paper statement requests: $5 per statement

Interest rates
Interest on a credit balance in your account is subject to change without notice, may vary according to the size of the balance and may be subject to minimums, as described more fully in the BMO SmartFolio Investment Management Agreement. Interest is not paid if the amount accrued is less than $5 per month. BMO Nesbitt Burns may earn revenue from the use of cash credit balances.

Foreign currency conversion
BMO Nesbitt Burns will act as principal for foreign currency conversions in your account unless otherwise disclosed. When a transaction requires the conversion of currency, BMO Nesbitt Burns will convert the currency at rates established or determined by BMO Nesbitt Burns or related parties. Exchange rates are subject to change without notice and may vary according to the market, type of currency in which the trade is transacted, and the value of the gross amount of the trade. In addition to the commission or other fees applicable to the transaction, BMO SmartFolio or parties related to us will earn spread revenue up to 1.5% from a foreign currency conversion.

Closing fees
You will be required to pay any accrued unpaid advisory fees up to the date of closing. These fees are subject to GST, QST, and/or HST where applicable.

You will be charged for any sales, use, goods and services, harmonized sales, value added, and transaction taxes which are incurred by or that may be charged to either you, BMO Nesbitt Burns or both (whether jointly or severally) by any governmental authority in any jurisdiction as a result of transactions in your account.

Try and add these two Fees together

The MER of the ETFs held within your portfolio are anticipated to be a weighted average of 0.20% to 0.35% of the value of your SmartFolio account."

Asset value	Annual Rate
First $100,000	0.70%
Next $150,000	0.60%
Next $250,000	0.50%
Above $500,000	0.40%

I know the Jeopardy champions can't do it; have you noticed they always 'miss' the math questions?

Solution16 – Transparency
Transparency of MF's/ETF's. Maybe not so much ETFs, but what are Mutual Fund's holding for 89 days before they 'window dress' their portfolios at quarter? Are they holding Valeant for 89 days to see if it pops? If we're dealing with Embedded Commissions, I think we'll soon be dealing with Embedded Securities and Positions. It might be high TERs (Trading Expense Ratios) that shines light on this 'dark' area.

Solution16a
There should be a 'PP' designation on Proprietary Funds/ETFs/Products. Meaning that the investor understands this may ultimately deny liquidity; or hurt returns if sold/transferred. But I know this will get 'spun' into a 'positive', that's OK. In essence, start disclosing the reason 'why' proprietary products are more appropriate to the client's objectives, constraints, risk profile than products from other third parties (available from the advisor). Or ensure the investor has 3 or 4 choices (across a price range and possibly Proprietary).

Solution17 – Wealth Industry Marketing
Limited Financial Services + Wealth Marketing. I read an article once, that described it was useless for banks to market as the 5-6% churn was unavoidable, and inevitable, and the only new business was immigrants. It was a study, as part of an advertisement, from a Big Consulting firm (could have been Deloitte or Accenture or KPMG or IBM), published in the Globe&Mail or National Post. It might have been a Big Data story. I just can't find it now (and I've tried) but I fullly acknowledge that the other side of the coin is that FinTech startups are the real threat, so 'Big Bank' and 'Big Insurance' Marketing, as bloated as it seems, might actually be effective to holding churn at 5-6%. But if we experience a Bear market, watch out for Regulation in this area. Wealth Industry marketing will start to track that of the Cigarette industry; Embedded Commissions are bad for Your Health. And too much Wealth Marketing will be scrutinized.

Solution19 – Mutual Fund Fees
Personally I'd love to see an indepth review of Mutual Fund fees; specifically, are they correct? Are they shown in conjunction with the TERs? Perhaps reported more frequently (daily on a website, maybe detailing the NAV calculation). I could be wrong, but the multiplicative and accumulative aspects of withdrawing 1/250th of a fee daily still makes me wonder if Mutual Fund investors are paying too much (ie. Is the Mutual Fund industry displaying linear math … but Mutual Fund investors are paying accumulative math?!?!).

Afterall, you don't get a receipt when the MER is deducted from your Investments everyday ☹.

Note: This may be a repeat, but with my trusted wealth professional, full-service IIROC, I pay every 90 days for my Taxable, RRSP and TFSA accounts. It is based on average asset value and this is the last calendar year I'll be able to pay for my TFSA and RRSP externally. But I pay every 90 days. In arrears. And I get a statement. And I can see my accounts online and I can talk to someone about it (my Trusted Wealth Professional).

Solution20 – 'Lower Fees Should be the Law'
(A quasi Repeat of Solution 9). Fee-Based Accounts with IIROC advisors shouldn't be higher than if you invested in Mutual Funds directly, so the Total Account Fee, that includes an F-Class fund should be examined in context of the A-class Mutual Fund fee. If you're paying more in Total overall Fees, although it could be for an exotic Mutual Fund, you should signoff on a separate waiver. Or just get an ETF. Better still, buy the individual securities. There are multiple ways to expose your portfolio to International and Emerging markets as well as new/niche sectors. Many many ways. Or maybe get a Trusted Wealth Professional.

Solution21 – Account Fees
My Trusted Wealth Professional has 2 different types of Fee-Based accounts; one for Growth and one primarily geared towards Income. The Income account has a restriction on Equities. This might be pervasive across the IIROC industry, I'm not sure. But there is merit here.

Solution21a – Volume Discounts
As your assets increase in value, at an IIROC-based firm, the Total overall Fee decreases. Every firm has their own discount schedule, but I'm in favour of standardization across the industry.

Solution Summary
Basically I'm advocating that the Advisor demonstrate their value; through Licensing, Service and Advice. Earn your Beeps. Do work for your clients, real Work. Stop fooling unknowledgeable Canadian Investors. I'd start with the Beep Ban and hope there isn't a social Fee revolt during the next Bear market. The Government can't afford to maintain our current lifestyle because we paid too much in Fees, or in Embedded Commissions.

The Crystal Ball -- An Epilogue and Foreshadowing

The Mutual Fund industry as a whole should look at adding new services and offerings, based on increasing their licensing and technology. I'd personally love to see a graph in my monthly statement, and access a graph online as well. And I'm OK if there are 100-1000 new IIROC firms.

But let's come back to the cries of 'Advice Gap' by the Mutual Fund industry; this is their own problem (IMHO). MFL (Minimal Financial Licensing), limited+proprietary products, and an Embedded Commissions first sales approach have created an 'Advice Gap' already. The Mutual fund industry is literally stating that, at present, they don't deliver Advice to their clientele.

Oxymoron: Mutual Fund Advice

Like Hidden/Embedded Commissions, Hidden/Embedded Advice is really Non-Existent Advice. Transparency of Advice and Service does not exist as there is no Advice + Service. See thoughts in the preceding Point #2

As in every sales based culture, the Mutual Fund Sales Channel is 'Whale Hunting', they are looking for a Mega Beeps client.

Yes, if you have \$1M or \$2M AUM, you're getting good/great Service and maybe Advice, but I always wonder what will happen if the market declines by 54% again. Even a 20% decline, or an average Bear market decline of 38%, will not be welcome by anyone in the Boomer age group. You can't re-gain Time, that is why you need to look at Buy&Rule ® as a method of capital preservation.

It is time for the MF industry to grow up. Their 'gravy train', a.k.a. Embedded Commissions only serves them, not their clients.

There are lots of '5 Forces' methods, Michael Porter's 5 methdology, of looking at the future of Mutual Fund industry.

1. Mutual Funds could be 'dissolved' entirely, unless Specialty Funds, otherwise Canadian Investor's will gravitate towards Robo's/Discount-Brokers and buy/utilize ETFs
2. Mutual Fund Manufacturers acquire Mutual Fund Channel (ie. GWL just bought FHG)
3. Mutual Fund Channel(s) acquire Mutual Fund Manufacturer(s); not likely
4. Investor pays directly to the Channel a full 2%; not likely to happen.

But my gut feel is that structurally, nothing will change, it is too difficult to transact M&A, but the Manufacturers' have already thrown the Sales Channel under the proverbial bus when CRM ½ required the Mutual Fund Channel's fees be shown first (while hiding their own portion of the MER for another year).

The Mutual Fund Channel is going to 'lose' in the present regulatory + consumer environment, so it needs to re-invent itself with Licensing, their own Robo's, and Service (ie. Graphs on statement). They need to go into full Beep Protection model. As there is quite a bit of 'direct' selling these days as well.

Note: I submitted a letter today to Liberal MP Wayne Easter, Chair of the Finance Committee, regarding the Hearings into the Sales practices of Canada's Big Banks. Sales Practices Canada-wide are going to be examine closely in the coming years; Insurance and Real Estate will be examined as well, anywhere the Beep Hunt is prevalent, there will be scrutiny and regulation.

And if the industry is already bloated with Sales Channel headcount (compared to UK + AUS), then not to worry; rightsizing will be welcome.

Fees, in the absence of definable Advice + Service will continually find a lower and lower point for the Sales Channel.

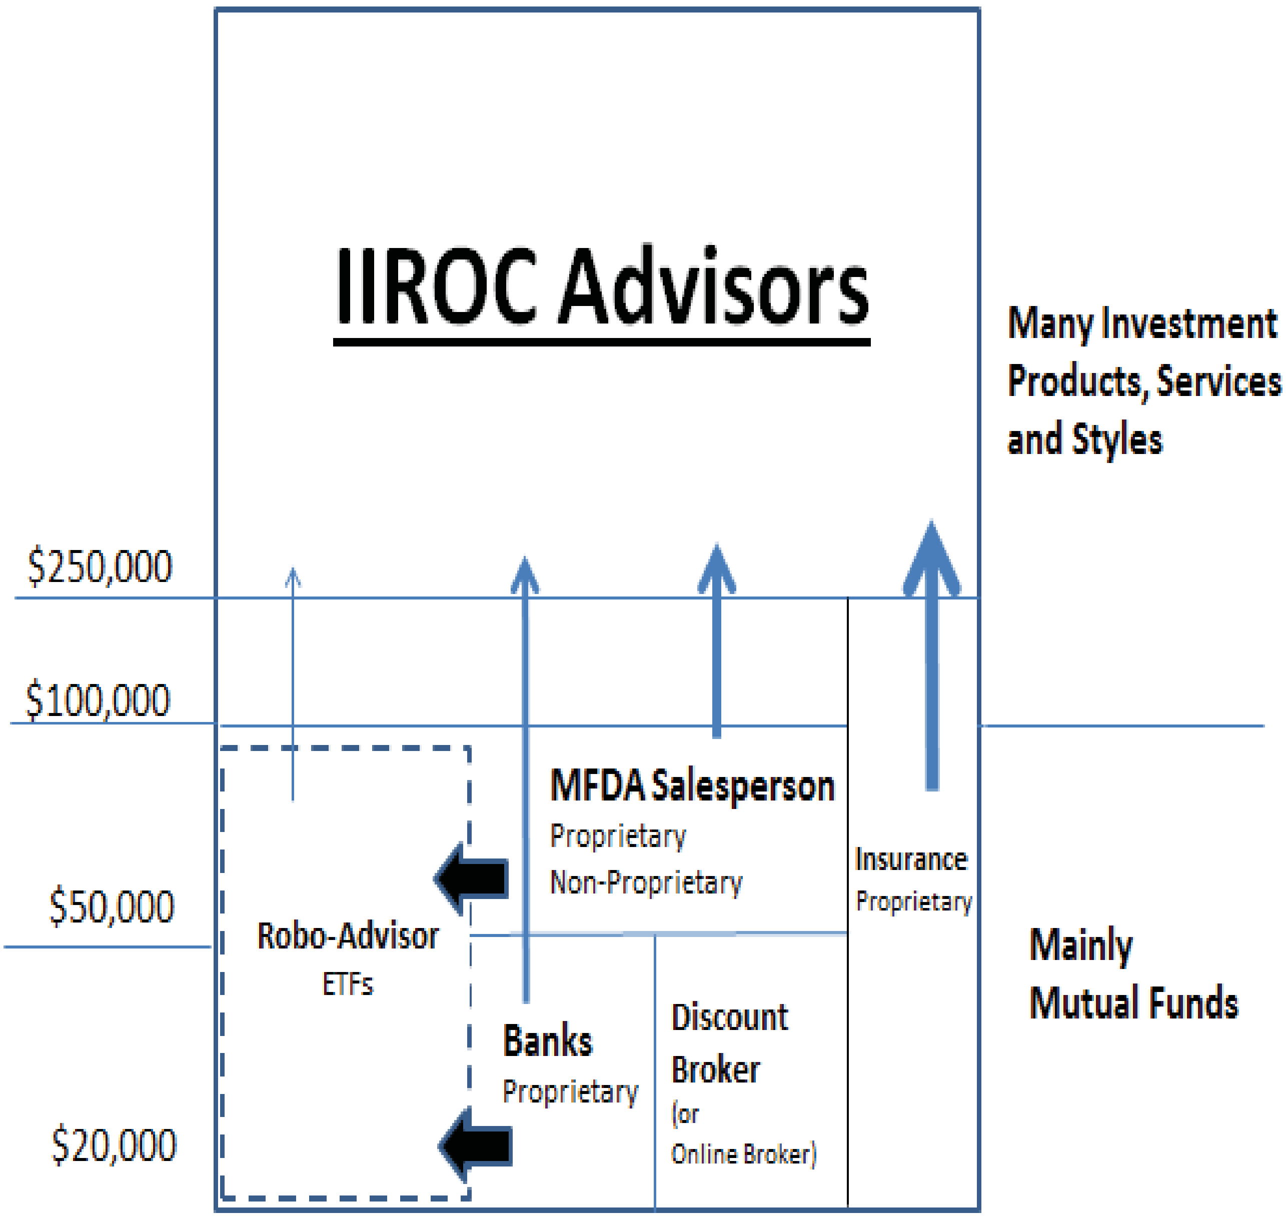
So thinking about:

1. CRM2, Fee and Performance disclosure.
2. the rise of cheaper ETFs,
3. discontinuation of Embedded Commissions,

there is a grim picture painted for the Mutual Fund industry.

And if that jab-hook-jab combination doesn't knockout the weak providers, then a Bear market will be the uppercut that finishes the job.

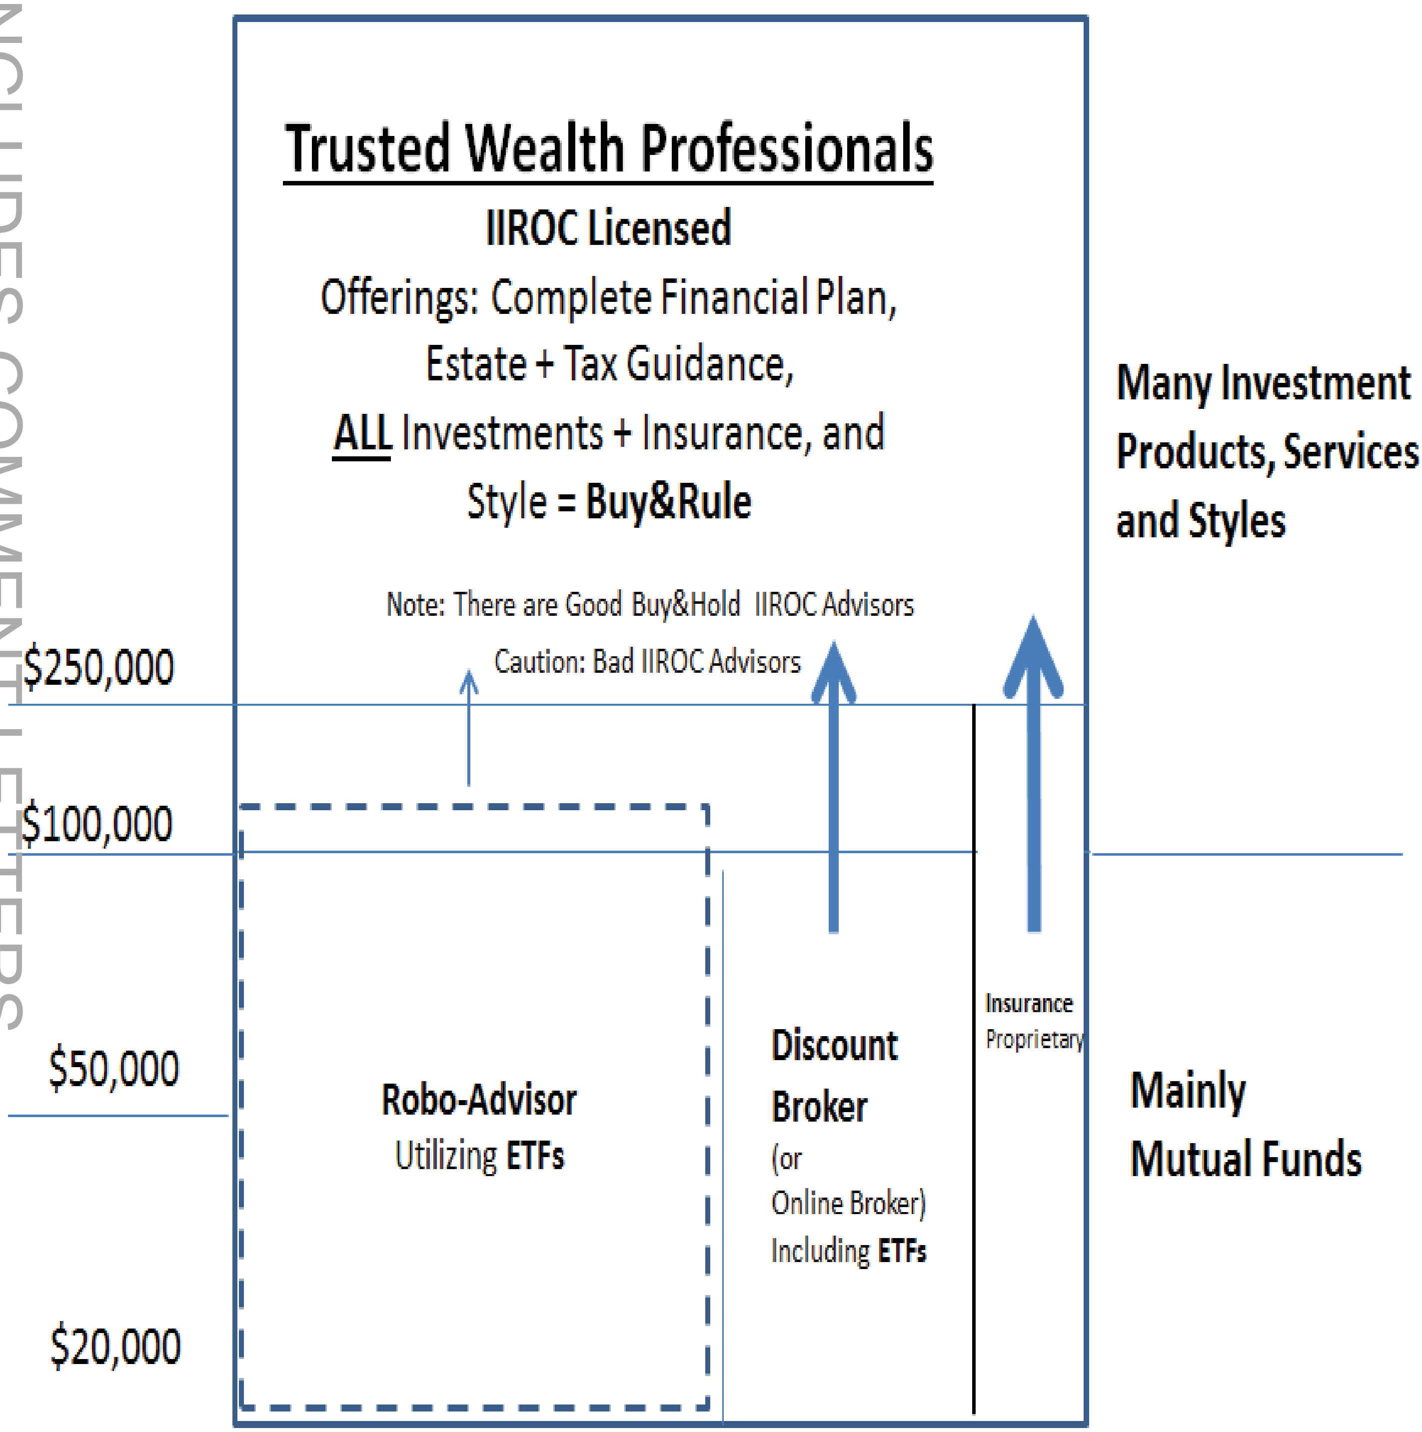
The MF industry needs to re-invent itself. The starting point is the Who Are The Players and Where are Assets flowing diagram below. The arrows show the 'theoretical' flows that are occurring today; think and thin arrows denote volume of flows.



Theoretically, the small accounts will migrate to Robo-Advisors. Large accounts will be gobbled up easily by the IIROC Trusted Wealth Professionals. Discount Brokers and the Insurance Channel will have eroded Asset Bases. Banks and Mutual Fund Sales Channel will lose heavily. Again, this is only theory.

But maybe it is reality.

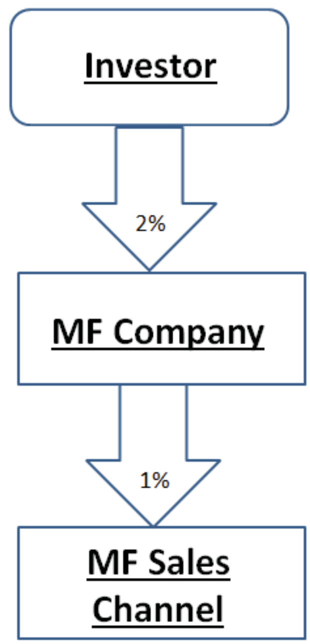
So the 'new' Wealth Industry Players and Assets are as follows:

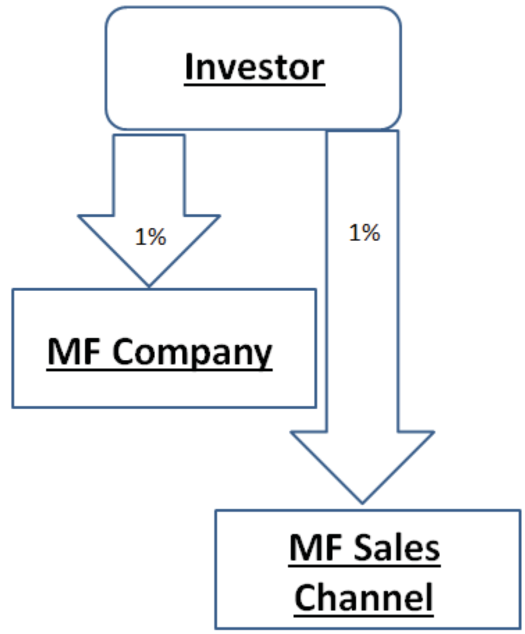


And maybe I'm wrong. Maybe not. But obviously biased. ☺

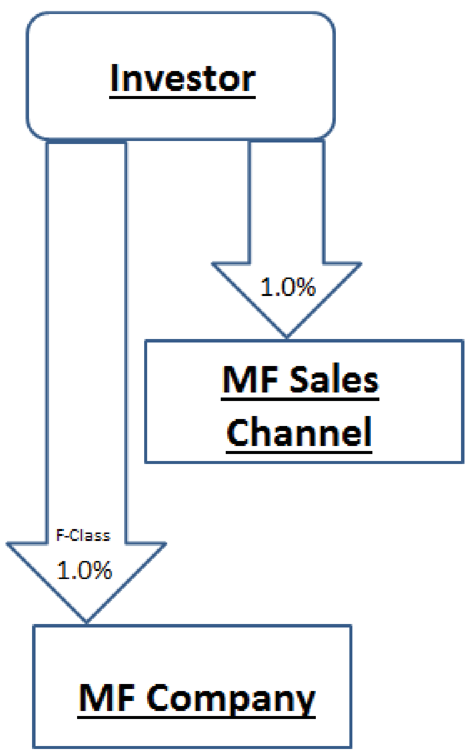
But the days of $1M accounts being unconsciously invested with a Robo, during a Bear market, are light years away.

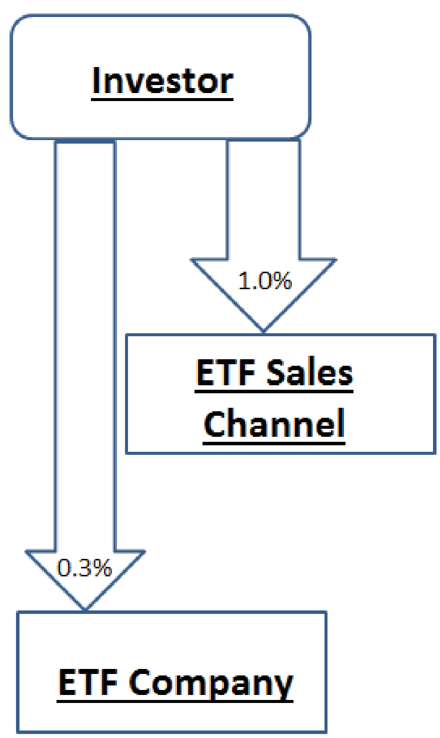
So the starting point, is how does the Sales Channel convince the investor to remain with the Mutual Fund Sales Channel, possibly through this dual Fee option (see 'right' image below).



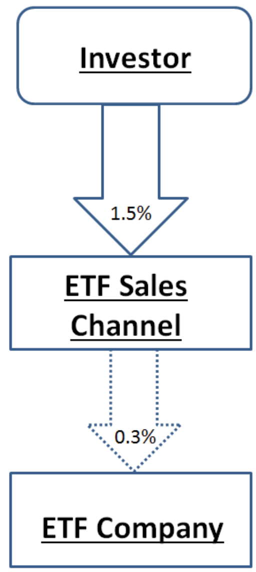


The Investor would essentially 'write' two cheques in that model. Even if the Funds were now F-class, or cheaper ETFs were used. But if the Mutual Fund Sales Channel up-licenced themselves to IIROC, and started sell ETFs, we'll see this switch occur.

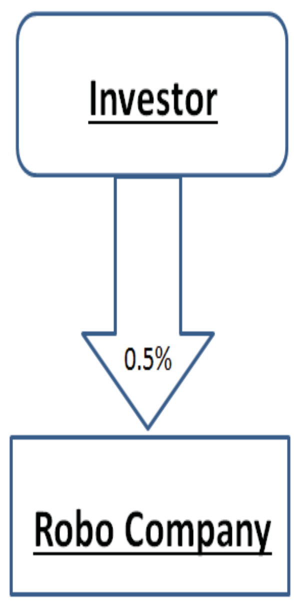




But it will probably appear as:



More expensive to the Canadian investor, but the long term threat is this model:



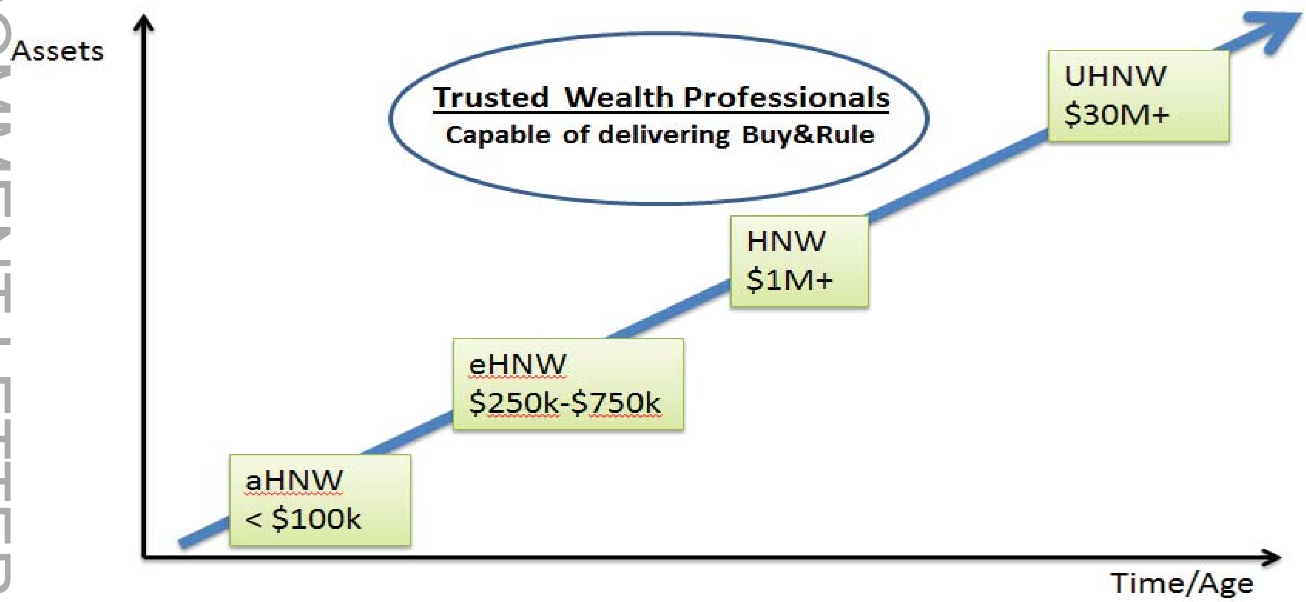
The point being, licensing matters. And if you have more+higher licensing, you can do more work for your clients, and charge higher fees.

Personally I think the Brokerage firms should lower their minimums and create Platinum, Gold, Silver and Bronze levels of Advice+Service. And start picking off the aHNW to eHNW marketplace; between $50k to $250k. If you start treating this niche, similar to the Service+Advice delivered to the full HNW client, you might end up with the most AUM ☺

The simple logic for the Crystal Ball is that the:

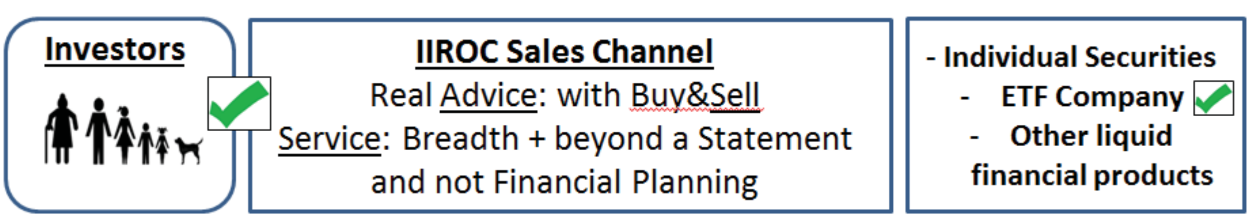
1. Highest licensed,
2. Full access to all Products and Services (a form of Liquidity),
3. Complete Tax, Accounting, Estate, etc … counsel, and
4. Practicing all Investment Styles, including Buy&Rule ®

will be the IIROC Life-Licensed Investment Advisor. All the Canadian investors want this Advice+Service offering; who wants an Advisor with lower licensing? Less Products + Services?



As mentioned above I believe that the IIROC licensed firms, will start to encroach into the aHNW marketplace as well; lowering their limits. This will be a strategic preemptive move against the Robo's. A Bear market will help in this regard. Just watch out for the 'bad' IIROC advisor. And I also wonder how many Robo's will survive the next Bear; there are going to be common acronyms, such as CDIC and CIPF, shared with

So, as Wealth Increases, as the rungs of the HNW Ladder are climbed, Canadian Investors will flock to the IIROC Sales Channel. The Wealthy, the HNW, know where to obtain Advice+Service.

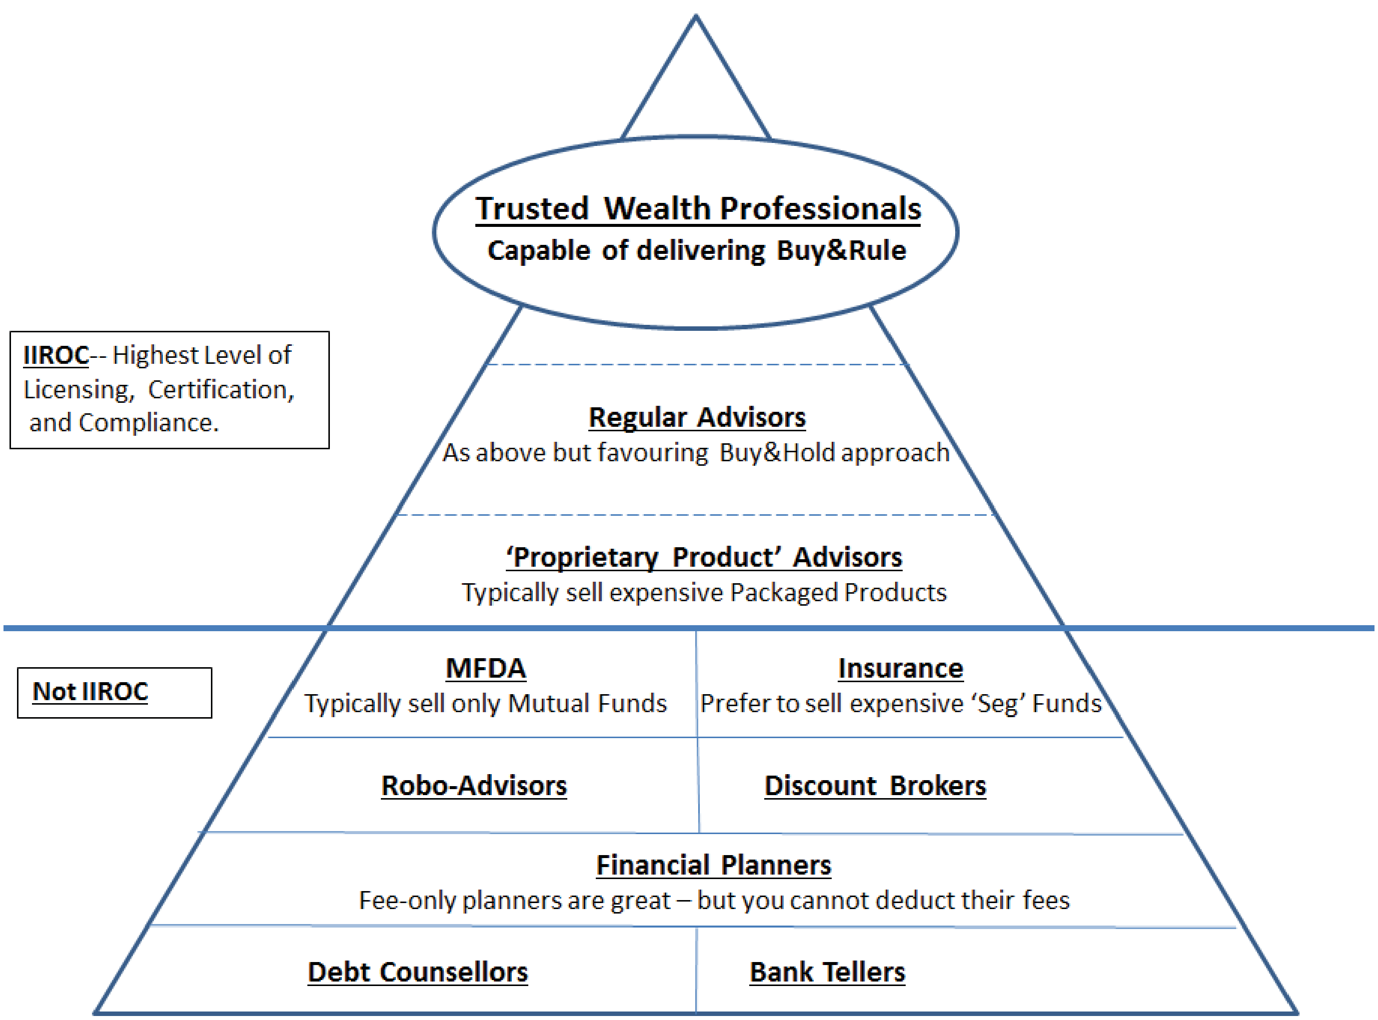


It may be the opportunity of a life-time, that as our current over-heated Bull market, returns to a Norm, via a:

1. Crash
2. Correction
3. Trickle-Down
4. Sideways Slide
5. Trickle-Up (but with lower growth than Inflation)

that the Investment Style Buy&Rule ® becomes the ideal haven.

The next Bear could be Gentle, or a ferocious Grizzly, but given a choice, I'd like to miss the most of it. That's why I have a Trusted Wealth Professional and don't use Mutual Funds. Capital Preservation and Liquidity are two components of the Advice that has been shared with me; reflected in my investment initiatives.



Addendum 1: The 'Bad Advisor' Blog may start

Up-Beeping is something that the 'Bad Advisors' are great at. If you left your MFDA sales person and transferred your assets to a full-service IIROC broker who has Financial Decidophobia (fear of making financial decisions), but they are a great relationship person, and they love the free lunches that mutual fund companies provide along with baseball tickets, luxury cruises, spa outings, Sonoma wine tasting 'junkets', etc … you may just find that your total Beeps now are greater than your Beeps you paid when transacting directly at your Mutual Fund company.

So you owned A-class mutual funds previously and now you own the F-class, but your total fees are higher. The average UpBeep is from about 200 Beeps to 225 Beeps.

And keep in mind your overall Wealth performance as well as some of these 'Financial Decidophobia' & 'Relationship-type' advisors are often swayed by the Mutual Fund sponsor of their latest Lunch&Learn or XMAS party. This is when Up-Beeping becomes Beep Churn (with not often positive results). But if you move from A-class to F-class, for the same Fund, and your total fees have gone up, this is bad news. You probably need lower priced no-commissioned ETFs (unless utilizing a specialty Mutual Fund).

Or you need to leave your Bad Advisor.

Addendum 2: Fee & Advice After-thoughts

Let's think about this example. Buying/Owning/Selling a home. Using round numbers as an example, you bought a home for $1M and paid 3%+3%=6% as a commission to Real Estate Agents. So that's $60,000 in Commissions. You pay your property tax, your utilities and upkeep. And now your Agent comes by and offers you a Valuation Service priced at 0.00365% to tell you what your house is worth; that's just $10/day. Do you buy it? It's made easy for you; automatically deducted from your bank account. And only $3650 per year? It could show you comparables in your neighbourhood? Perhaps via Monthly reports!

But you think that you don't need it, it's free online, or it doesn't matter now (you're busy and exhausted from commuting). You think it's a Scheme, it's a redundant, often free and value-less service. You can find out the value of your home, to the same degree of error+accuracy online now.

Please don't get charmed into thinking that a statement (online or not), or an annual phone call to inquire about a possible RRSP donation, is actually considered Advice or Service. IFIC's own statement shows that the average Canadian Mutual Fund investor has $46,000 at the end of 2015. So if we add a bit to that, and call it $50,000 now, there is no set standard level of Service or Advice that applies to a Mutual Fund investor. Hence it's all Commissions and Financial Planning, both of which are not deductible as ruled by the CRA. Note: I think the Fund Manager is doing all the work (if they aren't Closet Indexing).

Anyways, how do you feel about these 3 Advice+Service+Fee scenarios?

1. An 88-year old man had $2M in Mutual Funds at an Orangeville bank branch. He thought he only paid $100 a year in fees; that's what the Teller at the Bank told him. He recently passed away. Fee Shock was not the cause of his death.

2. A 55-year old recent divorcee, and first-time ever+anything investor, was convinced by a mutual fund sales person to invest her 2015 settlement proceeds of $600k in 'safe' mutual funds. Her first statement of 2016 showed her Oil based holdings were worth less than $500k. It did get worse, before it got better, but it still hasn't recovered. She's still alive. And single.

3. A 75-year old Grannie was convinced at the bank branch to switch her life-savings of $700k from GICs into a Bond fund just before the USA election. The Mutual fund sales person had never seen a period of rising interest rates; evidenced in November + December of 2016. Grannie now has $600k, pays about 100 Beeps per year in Fees,

and is worried about rising hydro rates. And property tax. And the cost of food. Grannie is counting her days, but not solely because the Bank is now wealthier. And I'm not sure if the Teller is still at the Bank.

Nothing moves in a straight line. The graph below is the last 10 years of the TSX. It is almost flat. And the market doesn't always go up. That's why Advice matters and why it is non-existent in the Mutual Fund Sales Channel. There's a Time to Sell. And a Time to Buy.

It's fair to say though, that if you have substantially more than $250,000, maybe $500,000, you do receive preferential treatment and service levels from your Mutual Fund Sales Person/Company. I don't disagree with that. But I'd love to debate how the Mutual Fund Services are defined; I know it isn't Advice.

Note: Adding to a position with an annual RRSP or TFSA contribution is not Advice. Most Mutual Fund Sales People just 'add' to the Pie-Chart; Balanced, Conservative, Growth, Income, etc … fund that you are already holding.

Addendum 3: Musings regarding Mutual Funds Commission-based Scheme

Commission-based Scheme - Summarization

1. Commission Laundering; Sales Channel Fee is non-deductible if paid directly to Sales Channel, and it's non-deductible if there is no Advice or Service beyond Financial Plan (non-deductible); see Point2 in the main section of the Beep Brief. No other consumer product is setup like this; none that I can think of, but that may change as well.
2. Mutual Fund companies pay themselves Daily, before calculating NAV. And it's an unknown amount and unknown communicated amount. "How much did I pay today?" "Or this year?" You don't know. You don't get a receipt. You don't know how much was taken. It's as close as you can get to an unauthorized withdrawal from your bank account And it is approximately 250 times per year. You get paid 2x/month, so 24 times a year, but you pay Mutual Fund fees 250 per year (with Embedded Commissions).
3. Embedded Fees, Canadian Investors don't see the Fees in total amount or percent amount until CRM ½ is shared on a statement at the end of the year. This denies the Liquidity by contrasting performance versus other instruments; ie. Bond Fund vs. 5-year GIC rate. All the Front-End Load, No-Load, DSC's, etc … bury the Fees such that the total Embedded Fee is roughly ½ Embedded Product Costs and ½ Embedded Commissions.
4. Trading Expense Ratios, TERs, are essentially a blank cheque (and they could be higher than some ETF Fees; 0.03% and 0.04% are ETF Equity fees that are in the public domain).
5. IIROC Advisor Fees decline when AUM increase (Fee-based account). I'm still perplexed; **there are no volume discounts on Mutual Funds?** Do they exist within the Sales Channel? Perhaps via rebates? If you had $1M or $2M in AUM, you probably would have a 1% (or 100 Beeps) Fee, or Less, via an IIROC advisor (OK, not via the 'Bad' IIROC advisor who 'gouges' their clients). But combine that with ETFs that charge 0.04 or 0.25, and you're better off with Advice and Liquidity from the full-service life-licensed IIROC advisor.

And yet we're still not talking about the Investments. And does anybody care about the Risk of the investments? And their Performance? Or if I made any money? Keep up with inflation? Beat a Benchmark? Retired early? Found Freedom at age 55?

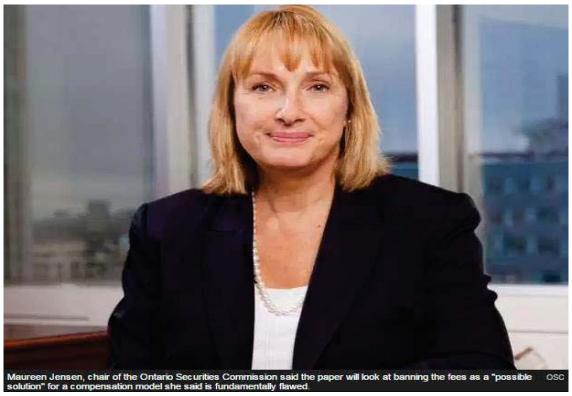
Nope.

Mutual Fund Sales Person got their Beeps. They DSC-ed you (potentially) and they have their Beep Loss Prevention Manual in case you try to Sell and go to Cash/E, or move your assets.

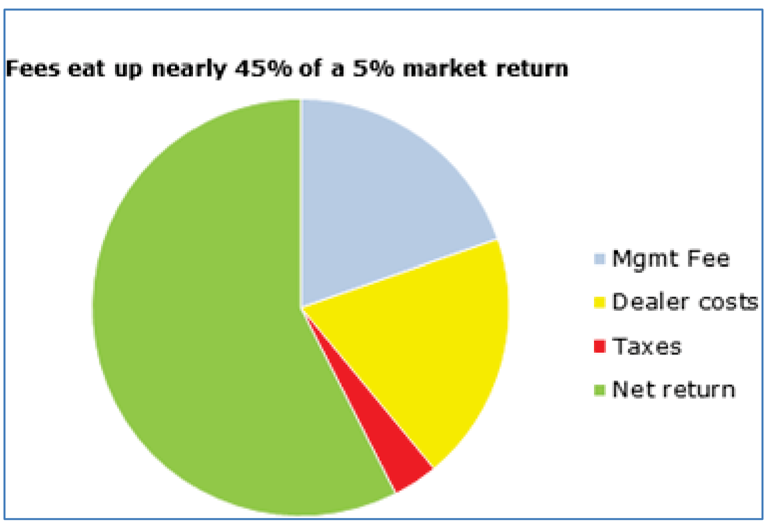
Back Matter

I've created a Beep Brief Back Matter over the past few months. It contains many pertinent articles; with the article title, the original article itself and source links, for my background reading when I was compiling Notes for myself.

It is available in softcopy and will accompany the Beep Brief Submission.



Maureen Jensen, chair of the Ontario Securities Commission said the paper will look at banning the fees as a "possible solution" for a compensation model she said is fundamentally flawed.



Thanks and Apologies

To my confidants, and my proof readers, many thanks. Especially for the stories about Profiteering via Embedded Commissions. And you've already received my apologies for enduring the Out-Takes and the Extracts from this Brief. Evidenced by the fantastic Spell-O's that are created when you've got no RAM left for Auto-Correct to run on your laptop ☹

Also there still might be a correction or two required in the Beep Brief, and I apologize for that in advance.

Plus, thanks and apologies to any of the creators of the non-watermarked images+cartoons I've snipped from the web. I've left an audit trail, where possible, to show the original sourcing.

INCLUDES COMMENT LETTERS

The Beep Brief

A response to the CSA CONSULTATION PAPER 81-408
regarding the discontinuing of Embedded Commissions.

Canada's market watchdogs assessing impact of ban on 'fundamentally flawed' embedded fund fee model

BARBARA SHECTER | September 27, 2016 6:23 PM ET

Maureen Jensen, chair of the Ontario Securities Commission said the paper will look at banning the fees as a "possible solution" for a compensation model she said is fundamentally flawed. OSC

Ontario Securities Commission chair Maureen Jensen says Canada's compensation model for mutual funds is fundamentally flawed and that regulators are looking at an outright ban on embedded fund fees as a "possible solution."

"The current compensation model consists of fees set by the fund manager to incent sales," Jensen said Tuesday in her first major address since taking the helm of the country's largest market watchdog. "This does not put the investor's interest first, and that's a fundamental flaw that needs to be addressed."

Following the luncheon speech at the Toronto Board of Trade, Jensen told media it is up to the investment industry to come up with a viable alternative to a ban.

She said some suggested alternatives, such as capping the embedded fees, do not go far enough because they don't eliminate conflicts of interest at the heart of the current system.

"We know this would be a major change for investors and the industry," she told the business crowd during her speech. "That's why input from all of our stakeholders is necessary throughout this process."

The Canadian Securities Administrators, an umbrella organization for provincial commissions, will publish a consultation paper by the end of the year that looks at the potential impacts of an outright ban on embedded fees for investment funds, including mutual funds. It is the culmination of an examination that has been under way for more than three years.

The investment industry has fought strongly against curtailing embedded mutual fund fees, which have been banned in other jurisdictions such as the United Kingdom. Industry groups argue that banning the embedded fees in favour of a set annual fee for advice would squeeze some investors out of the investment game because they either cannot afford, or would chose not to pay the upfront fee.

Industry representatives have also argued that new rules requiring greater disclosure of fund fees will improve outcomes for investors by giving them a better understanding of what and how they pay for advice.

Jensen called these "critically important" changes, but said "disclosure alone is not enough."

In her speech, she cited research from the National Bureau of Economic Research that she said suggests a combination of embedded fees and unsuitable portfolio construction has caused the investment returns of advised clients to lag passive market benchmarks by two to three per cent a year.

"The impact of these fees on investor returns is significant," she said. "Investors experiencing this kind of outcome on a consistent basis would never break even and would, in fact, be worse off."

Jensen, who took the helm at the OSC in February, also used the speech to announce that the regulator will be the first in Canada to launch a hub to work directly with fintech companies. The official unveiling of LaunchPad is to take place in a few weeks, and the plan is to help the upstart financial technology firms navigate — and even potentially tailor — the regulatory framework.

The upstarts, which use technology and data to compete in traditional financial services business lines from lending to investment advice, don't fit "neatly" into current regulations, Jensen said, acknowledging that some requirements "might not make sense" for the new business models.

"Based on our experience so far, many Fintech companies 'don't know what they don't know' about operating in a regulated industry, and that can threaten their ability to do business," she said. The idea behind LaunchPad is to help "tailor regulation and oversight to their unique business models, as long as investor protections are in place."

Forty fintech firms have sought registration over the past couple of years, Jensen said, adding that these include online advisers, peer-to-peer lenders, and crowdfunding platforms.

She said another recent OSC initiative, a paid whistleblower program with rewards of up to $5 million for tips that lead to successful cases against those who breach securities laws, has already proven "fruitful." It has generated 30 tips since the launch in July, some of which involve alleged malfeasance on accounting statements and disclosure violations.

There are suggestions of "serious potential offenses" among the tips received, Jensen said, adding that tipsters are coming forward to reveal alleged activity and behaviour that would have been very difficult for the commission to unearth on its own.

"I am encouraged by these early results," she said. "New enforcement tools like this will help us resolve cases more quickly and effectively."

PORTFOLIO STRATEGY

Lower-cost mutual funds? Dream on

ROB CARRICK
The Globe and Mail

Published Friday, Apr. 25, 2014 6:09PM EDT

Exchange-traded fund companies have been slashing their fees lately in a display of macho one-upmanship that you never see in the mutual fund business.

Mutual fund fees are the black hole of Canadian investing. We know from work done by the independent analysis firm Morningstar that our fund fees are among the world's highest. But the fund industry's reluctance to talk about fees makes it hard to tell whether they're falling or not.

So let's dig into the numbers. As a proxy for the fund industry, we'll look at 12 popular mutual funds with combined assets of close to $100-billion. Three of the funds had lower fees in late 2013 than they did five years ago, while nine were charging more.

The past five years were a period when fund companies had to deal with the introduction of the harmonized sales tax in some provinces. A key competitive consideration for the fund industry: Eat the extra costs of the HST, or pass them along? Other business pressures over the past five years included the rise of the ETF sector, which is much smaller than the mutual fund industry but faster growing, and the lingering shock to investor confidence caused by the market crash of 2008-09.

As shown by the group of 12 widely held funds, the overwhelming preference in the fund business over the past five years was to let fees float higher. Where fees did rise, the total increase was typically 0.1 of a percentage point or less. While such increases would have had a modest effect on investor returns, they're still highly symbolic. They suggest that investors should give up on the idea that mutual fund fees in Canada will ever meaningfully decline on an industry-wide basis.

This sort of decline has long been anticipated, in part because our fees are high on a global basis. Fee competition from the ETF business, a direct competitor to mutual funds, would also suggest lower fund costs ahead. The final argument for lower fees is based on economies of scale – the idea that funds become more efficient to run when their fixed costs are applied against rising assets.

On our list of 12 popular funds, there is one that has become significantly cheaper in the past five years. It's Investors Dividend, which went from a management expense ratio (MER) of 2.68 per cent in 2009 for its Series A version to 2.39 per cent in 2013. Investors Group announced a year ago that it was cutting fees to make its comparatively expensive products more competitive, and here is one tangible result.

Fees also declined for Dynamic Strategic Yield and Beutel Goodman Canadian Equity over the past five years, though not so dramatically. The latter fund's decline was notable because the fee was already near the low end for Canadian equity mutual funds.

The nine funds with rising fees over the past five years show a pattern of multiple small increases. The $17.5-billion RBC Canadian Dividend Fund – it's the country's largest mutual fund, according to Globeinvestor.com – has had the MER for its Series A version rise from 1.7 per cent in 2009 to 1.79 per cent in 2013.

A spokesman for RBC Global Asset Management said the rising MER is due entirely to the HST. He also noted that the administration costs built into the MER were cut by 0.02 of a percentage point at the beginning of 2014, while the administration fee for RBC Balanced fell 0.04 of a percentage point. "Overall, over 90 per cent of RBC GAM mutual funds have MERs that are below the category average," he wrote in an e-mail.

It's worth noting that every bank-run mutual fund on the list of 12 popular funds is more expensive to own than it was five years ago. This is admittedly a small sample, but the banks do seem intent on squeezing more fee revenue from their mutual funds.

Rising fees may seem inconsequential for a fund like RBC Canadian Dividend, which has regularly outperformed both the average return for its peers in the Canadian dividend and income equity category and the S&P/TSX composite total return index.

BMO Bond is a different story – returns have been consistently below average over the past five years. Scotia Canadian Dividend made 13 per cent annually for the five years to March 31, while its peers averaged 14 per cent and the index averaged 13.7 per cent.

How common is it for investors to pay fees – maybe even rising fees – for indifferent or worse returns? “Out of all the mutual funds I cover, I would say 25 per cent are pretty decent,” said analyst Dave Paterson of D.A. Paterson & Associates. “You’ve got another 50 per cent that are acceptable, but you might as well be in an ETF, and 25 per cent that probably shouldn’t be sold.”

ETFs have tiny MERs because they’re robotic index-trackers for the most part, whereas mutual funds must bear the cost of analysts and portfolio managers who select individual stocks and bonds. Fund fees also include commissions paid by fund companies to the advisers and dealers who sell their products, whereas ETFs typically do not.

A fair-and-square comparison of ETFs and mutual funds would add a percentage point to ETF fees to cover the cost of investment advice and financial planning that is baked into most fund fees. But thanks to the latest round of fee cuts, you can combine ETFs and fee-based advice and still pay much less than you would with mutual funds.

The iShares S&P/TSX Capped Composite Index ETF (XIC) has an estimated MER of 0.05 per cent today, down from 0.27 per cent a year ago. The iShares people cut the cost of this fund in response to a fee reduction made a while back in a competing product, the BMO S&P/TSX Capped Composite Index ETF (ZCN). BMO’s response came this week – a further fee cut in ZCN to match iShares.

The back story here is that ETFs had a disappointing 2013, sales-wise. While global stock markets soared, the flow of money into equity ETFs was offset to some extent by money pouring out of bond ETFs. Add a growing number of competing ETF providers to this picture and you end up with recent fee cuts announced by iShares and BMO.

The mutual fund industry had quite a decent year in 2013 and now sits on roughly $1-trillion in assets, compared to $66-billion for ETFs. Do not expect a mutual fund fee war any time soon.

GIVE CLIENTS A REAL CHOICE

John J. De Goey / January 4, 2011

Advisors generally do a good job in helping their clients make smart decisions with their money. Most try to help clients obtain a meaningful understanding of capital markets. Most try to make reasonably suitable recommendations. These advisors will diversify between equity and income, value and growth, small cap, large cap and a number of other ways, too.

What I see less of though is a diversification between active and passive products and strategies. This, of course, could be an all or nothing proposition or a mix and match (core and satellite) combination.

Most financial advisors recommend an all active approach all the time. These same advisors insist they have no bias at all and that they go out of their way to help their clients make informed decisions about the products and strategies being pursued.

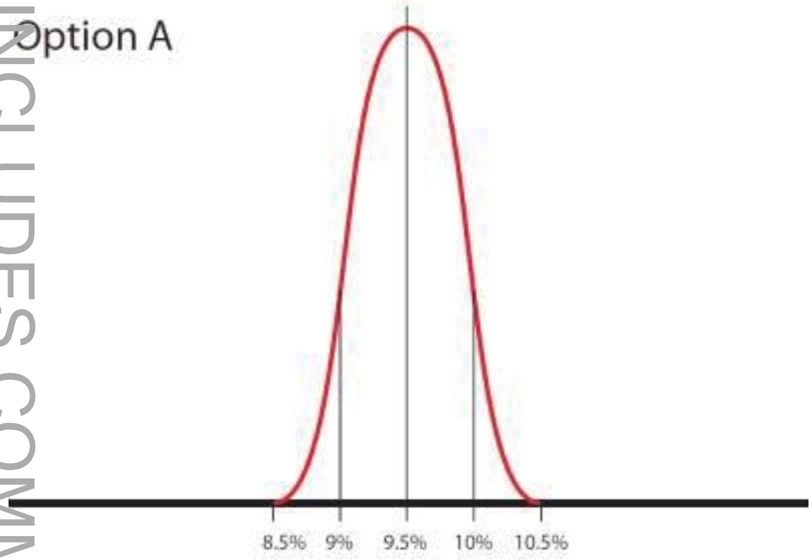
I beg to differ.

My sense is there are advisors who are deliberately silent on the matter of cost impacts when discussing options with their clients.

Here's a simple example. Why not show clients both options? Don't direct them one way or another to start. Simply explain that both options are on the table and that over the course of their lifetime, both would likely be reasonable depictions of their overall investment experience.

For anyone who wants a credible bit of background and rationale regarding what follows, please read William F. Sharpe's "The Arithmetic of Active Management". If you can't locate a copy, you can get it here.
Sharpe's paper provides a simple way of combining the notions of risk, return and cost. It shows that both historically and logically, an average investor's expected return is the return of the asset class minus the cost of the product used to get exposure to that asset class- plus or minus a degree of variance.

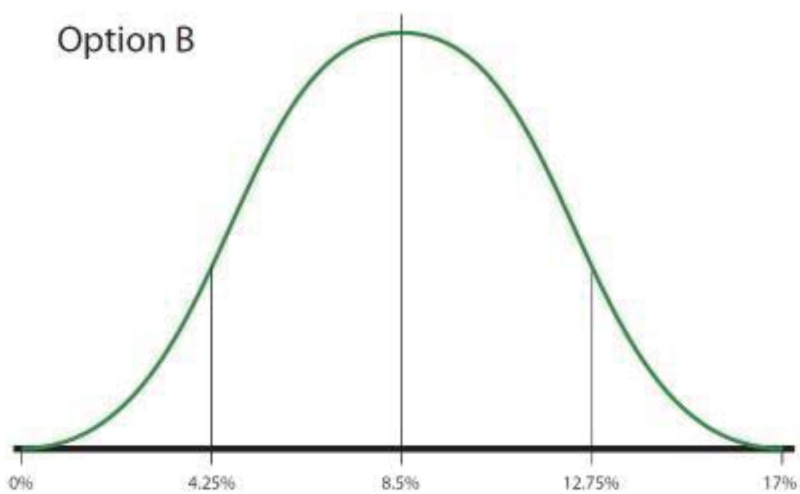
In my illustrations, Option A features a 9.5% average expected return with a relatively modest variance (tracking error), while Option B features an 8.5% average expected return, but with a fair bit of additional variance (positive or negative "alpha").



Since the differences are due to product cost and the likely dispersion of returns, we're left with Option A hugging a benchmark minus a lower cost, +/- a tracking error and Option B costing more and having a greater variance of possible return outcomes due to security selection.

One would reasonably expect modest tracking error for the passive option and a much higher variance for the active option. If markets return 10% and the passive option costs 0.5%, while the active one (featuring no advisor compensation) costs 1.5%, then the long-term difference is 1% per annum- forever.

Is it worth a certain 1% cost increase if that choice is most likely to involve a similar reduction in long term returns with a wider dispersion of outcomes? Remember that for every person on the right side of the centre line in either option, there's another on the left side. There are pros and cons to both approaches, but which option is a typical investor more likely to choose if asked? Both options have a constituency.



Considering the choices available according to Sharpe's paper, investors should clearly understand their two options. Here's a value proposition that you may wish to consider taking to them. Ask "If I could show you how to save tens or even hundreds of thousands of dollars over the course of your lifetime by simply replacing your current investment products with products that have a similar expected pre-cost risk and return profile, but which cost 1% less and have less expected volatility, is that something that would interest you"?

All I know is that every time I ask that question, I get a resounding...Yes.

In fact, the only people I've ever met who don't give such a response are the people who would never asked the question in the first place.

How much are your mutual funds really costing you?

New fund industry trade group infographic understates long-term effect of fund fees.

By Christopher Davis | 20/07/16

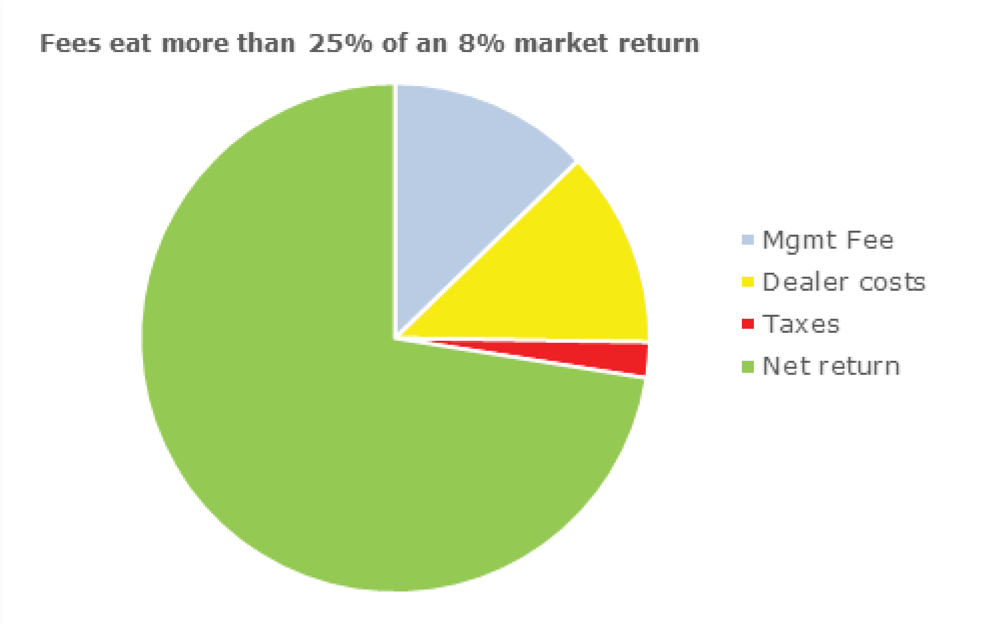
What Scottish poet Andrew Lang said of politicians--that they "use statistics in the same way that a drunk uses lampposts"--could also be said of the Investment Funds Institute of Canada's (IFIC) recent effort to illustrate the value investors receive from paying mutual fund fees.

Christopher Davis is Director of Morningstar Research at Morningstar Canada. In this role, he oversees Morningstar's Canada active fund research analyst team and sits on the Canadian Morningstar Analyst Ratings Committee. He is Morningstar Canada's lead analyst for the Fidelity and Sentry fund families. He also represents Morningstar on the Canadian Investment Funds Standards Committee. Prior to assuming his current role in 2012, he was a senior fund analyst in Morningstar's U.S. office. During his tenure, he led Morningstar's coverage of Fidelity Investments and was the editor of the Fidelity Funds Newsletter. He also served as the lead analyst on several other asset managers including the Baron, FPA, Columbia Acorn, Ariel, and T. Rowe Price fund familes, as well as for the health-care category. His specialties included behavioral finance, income oriented, and tax-managed fund. He also oversaw Morningstar's target-date fund coverage of the Fidelity and TIAA-CREF series. Davis joined Morningstar in 1999 as a data analyst and became a fund analyst in 2000. Davis holds a bachelor's degree in economics and political science from the University of Illinois Urbana-Champaign

The industry trade group says its recently released infographic on the topic, which coincides with new regulatory requirements under the Client-Relationship Model – phase 2 (CRM2) mandating dollar-value disclosure of advisory fees, is designed to illustrate the impact of fund management, distribution and tax costs on investor accounts.

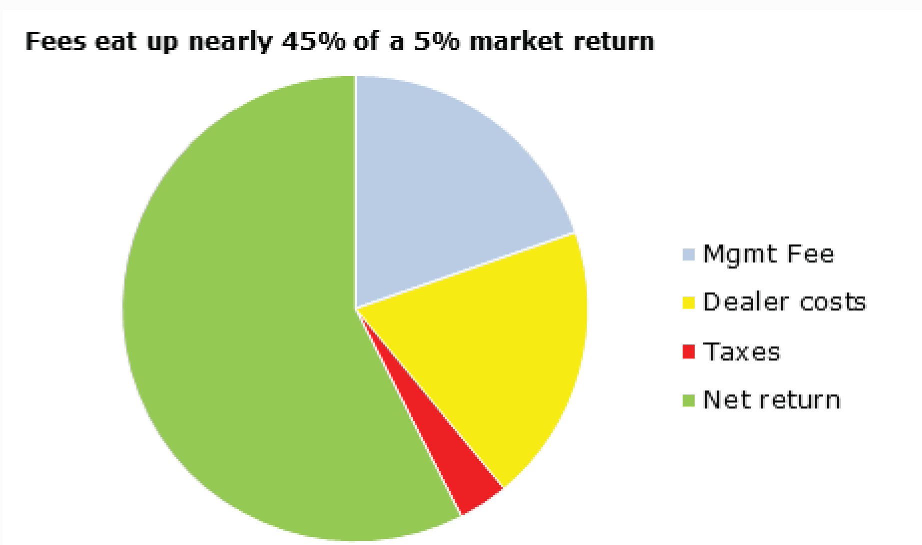
Given its source, the message to investors isn't too surprising: You're getting a great deal! If a fund's management-expense ratio (MER) is 2.2%--which an IFIC-funded study says is the average asset-weighted cost of funds sold through advice-based channels--just 2.2 cents of every dollar invested gets you professional money management and investment advice. All but a tiny slice of the pie grows along with your investment.

IFIC gets the basic arithmetic of fund expenses right, but it doesn't put them into the proper context. What sounds like a trifling sum in comparison to the size of your overall investment appears quite substantial as a proportion of your investment's returns. Let's say your 60% stock/40% bond portfolio closely matches the 8.4% pre-expense return[1] this asset mix has averaged over the past 30 years. An 8% return before fees turns into 5.8% after subtracting the 2.2% MER. What IFIC calls a great value will have eaten more than 25% of your investment returns for the year, as the chart below demonstrates.



Source: Morningstar. Chart assumes 8% gross annual return and 2.2% in annual expenses.

Market returns mean fund expenses chew up an even larger piece of the pie. This is a reality investors may confront in coming years. While it was plausible to expect 8% gains from a 60/40 portfolio over the prior three decades, investors should expect more subdued long-term returns going forward. With the FTSE TMX Canada Universe Bond Index--the bellwether for the investment-grade bond market--yielding a skimpy 1.8%, it's all but impossible to match the 9% annualized gain it notched over the 30-year period. It's not beyond the realm of possibility a 60/40 portfolio returns 5% instead of 8%. Instead of swallowing 25% of pre-expense returns, the MER would gobble nearly 45%.



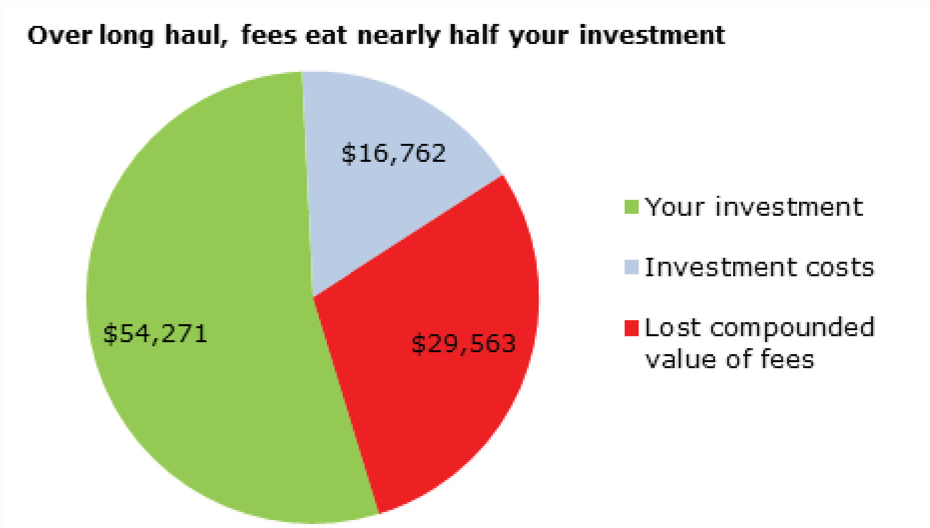
Source: Morningstar. Chart assumes 5% gross annual return and 2.2% in annual expenses.

Thanks to miniscule yields, bond investors will feel the expense pinch the most. The median MER for commission-based core domestic bond funds clocks in at 1.59%, consuming nearly all of the investment grade market's 1.8% yield. Yield typically makes up the better part of bond returns, but that's especially the case these days. The bond market has benefited mightily from the boost it's gotten from three decades of declining interest rates--bond prices and rates move in opposite directions--but with yields at already-low levels, there's not much room for them to fall further. (And if they rise, you're likely to earn negative returns, adding insult to the injury of a yield-swallowing MER.)

The ugly math of fund costs: Where compounding works against you

The harm done by fund fees worsens over time for the same reason your investments grow. If you've shelled out 2.2 cents on the dollar in fees, the 97.8 cents put to work grows exponentially thanks to the magic of compounding. But so does the value of the 2.2 cents paid in fees.

As an example, let's get back to the 60/40 portfolio averaging 8% annual returns before fees with a 2.2% MER. Over a 30-year period, a $10,000 investment will grow to about $54,300 after fees. Over that stretch, the investor will rack up almost $16,800 in investment expenses. However, the opportunity cost is a lot higher. Without fees, $10,000 would rise to about $100,600 over 30 years. The difference between the before- and after-fee balance--more than $46,000--is almost three times what the investor paid in fees. The cost to the investor isn't just $16,700 but also the more than $29,500 in foregone gains. While the MER will have consumed about a quarter of the investment returns on average in a single year, the combined explicit (investment fees) and implicit (compounded value of investment fees) costs will have devoured 45% over a three-decade span.



Source: Data generated using Savii Financial Concepts MER Calculator.

Beware of termites

Of course, there's no world where you can invest without fees. Investment managers don't work for free, though low-cost ETFs now offer something not far from it. Paying for financial advice, whether as part of or separate from the MER, chips away at returns on one end, but a capable advisor can more than make up for it on the other by minimizing investment and tax costs, managing asset allocation, and ensuring clients save enough and stick to their financial plan when the going gets rough.

The question, though, isn't whether investment providers should be paid but how much. Because the price you pay comes directly out of your investment returns, less is always better. Even seemingly small costs add up over time. As John Oliver, the host of HBO's *Last Week Tonight*, more colourfully noted, fees are like termites: They may be small and barely noticeable, but they'll eat your future.

Note

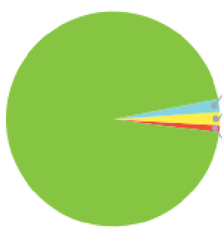
IFIC.CA

VALUE FOR YOUR MUTUAL FUND FEES

Your fees pay for services provided by:

- **Your fund manager** – the company that manages the mutual funds that you buy.
- **Your dealer** – the firm where your financial advisor is registered. Some dealers charge an additional fee to you directly.

...and for taxes to federal and provincial governments.



These three types of costs are reflected in the fund's Management Expense Ratio (MER).

- Your Money – Invested to Grow
- Fund Manager Fees
- Dealer Fees
- Taxes

FUND MANAGER SERVICES

- Sets the **strategy and goals** for a fund
- Keeps **records** for the fund and for all clients, including tax reporting
- Chooses and monitors **experts who buy and sell** investments to match the fund's goals
- Provides or arranges for **legal, accounting, audit and custodial services**, and ensures the fund meets regulatory requirements

DEALER SERVICES

Your dealer firm provides these services to you directly or through your advisor, and works to ensure your advisor meets government rules and regulations:

- Understands and reviews **your financial needs** and **how much risk** you are willing and able to handle
- **Keeps detailed records** about your account
- Delivers **account statements** and other information to you
- **Guides you** to build and maintain your financial plan
- Provides you with **information and access** to your account online
- **Buys/sells units** of a fund for you, based on your needs and your ability to handle risk
- Is a member of **investor protection funds** and **regulatory organizations**

TAXES

GST and HST are charged on fees and services

Fee-based compensation could take a huge toll on MGAs

by Alain Thériault Feb. 28, 2017 07:00 a.m.

The newly minted obligation to disclose mutual fund fees will probably spread to segregated funds. If the regulators also ban embedded commissions and MGAs are forced to implement fee-based compensation only, it may cost them $200 million, a recent study finds.

The consultation by the **Canadian Securities Administrators** (CSA) on the possibility of eliminating embedded commissions in mutual funds is troubling MGAs. They worry that this ban will spread to segregated funds, just as disclosure has.

Disclosure of segregated fund commissions would affect MGAs' economic model because of their structure. This finding was stated in an *Insurance Advisory Service* report on MGAs published in August 2016, produced by **Strategic Insight**.

An excerpt of this report obtained by *The Insurance and Investment Journal* states that the segregated fund compensation model will continue to be largely skewed towards deferred sales charges (DSC). This compensation structure accounted for 40% of gross seg fund sales in 2015, compared to 20% for mutual funds during the same period. The smaller proportion of DSC for mutual funds is due to the fact that CRM2 disclosure requirements already apply to them.

"Based on MGA gross sales and the estimated DSC share in 2015, DSC point-of-sale commissions alone had an annual economic impact on MGAs and their advisors of approximately $200 million," the report confirms. Strategic Insight thinks that DSC will have a greater on impact MGAs than on mutual fund dealers.

Hub Financial President **Terri Botosan** is optimistic despite these regulatory issues. "It's a very exciting time for the MGAs: we must participate in discussion with the regulators, and make sure that every party considering these decisions understands what that might mean for the customers," she says.

We know that disclosure is imminent for segregated funds, **James McMahon,** president of **Financial Horizons Group** – Quebec. "Regulatory changes are accelerating in the industry, and we have to spin on a dime, which is getting more and more expensive. We have a back-office system for mutual funds and segregated funds, with a staff of over 50 people. If the advisors all go to fee-based compensation tomorrow morning, it would take me four to five years to absorb the shock," he says.

The **Canadian Association of Independent Life Brokerage Agencies** (CAILBA) and the insurance industry overall have clearly expressed their support for embedded commissions in segregated funds to the **Canadian Council of Insurance Regulators** (CCIR), says **Michael Williams** a **BridgeForce Financial Group** (BFG) partner who is also president of CAILBA. "Agents are not afraid of disclosing and stating at the point of sale with the client that they have a choice as to how they pay for advice. I hope the regulators heard the message. Even if mutual funds embedded commissions are banned, we believe we can still support embedded commissions on seg funds with success," he adds.

Six of one…

James McMahon thinks that by banning commissions, regulators will create a bigger problem than the one they wanted to solve. "Take a couple who saves $25 or $50 per month and over the years manages to accumulate substantial assets. Who will take care of them, who will help them? The regulators haven't answered that question yet!"

Michel Kirouac, vice-president and general manager of **Groupe Cloutier**, does not understand why the CSA is leaning toward one model rather than another. He views them as equivalent. "I don't really see a difference between charging the customer fees and selling funds with embedded commissions. In the industry, 90% of funds foresee compensation for the advisor of about 1%," he explains.

Compensation still hovers around this mark, Kirouac adds. A fund with embedded commissions whose management expense ratio (MER) is 3% will pay the advisor a trailing commission of 1%. The rest will go to the manufacturer. If this fund exists in an F series, the MER will be 2% and the advisor can adjust his or her trailing commission. "For example, we see an average trailing commission of 0.6% to 1% in F series funds," Kirouac says.

In the fee-based model, customers pay the manufacturer fees of 2%, and the advisor negotiates the fees directly with the customer. "This is the model that the regulators are heading toward. If the fee-based model is imposed, this may affect the value of investment fund blocks of business," Kirouac points out.

Michel Kirouac is not a fervent believer in the single fee-based model. "100% transparency is a fine principle, but what will the banks put on their statements? This reform will confuse people for nothing, in addition to affecting advisors who manage large asset volumes. We are not against disclosure, and it's already required by law. But eliminating trailing commissions would be quite a shock, and we would have to learn to live with it," Kirouac adds.

Groupe Cloutier is poised to submit a brief as part of the CSA consultation on the possibility of banning embedded commissions in mutual funds.

More mutual funds jumping on the ETF bandwagon

by Leo Almazora20 Apr 2017

With ETFs gaining traction among investors worldwide, mutual fund managers would have every reason to dislike their low-cost competition. But there's evidence that, for some, it's a love-hate relationship.

Citing data from independent investment research firm Morningstar, Marketwatch reports that more mutual fund managers are including ETFs in their portfolio.

In 2016, 1,222 mutual funds had an ETF among their holdings, accounting for a median value of 4.5% of the mutual fund's total assets under management.

Compare that to 2006, when there were only 595 ETF-holding mutual funds, with a median of 1.2% of the fund's assets placed in an ETF.

Such mutual funds are still the minority, however: a 2016 fact book released by the Investment Company Institute, an association of US funds, reported that there were more than 9,000 US mutual funds in 2015, holding US$15.7 in assets.

The top ETFs for mutual funds were equity-based, with the most popular being the SPDR S&P 500 ETF Trust — the largest ETF on the market with US$232 billion in assets. Six of the most widely held were bond ETFs, among which were two "junk bond" funds.

Morningstar didn't list which mutual funds used which ETFs, but it's possible that mutual fund managers use fixed-income ETFs to easily obtain broad exposure to the bond market, especially less liquid areas like emerging-market debt.

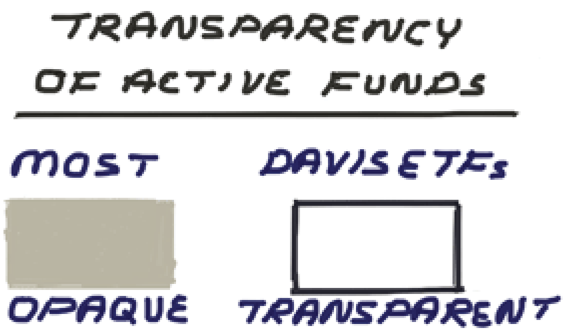
A Simple Solution to Offering an Active ETF

Thursday, January 12, 2017



Three new exchange-traded funds began trading today: Davis Select U.S. Equity (DUSA), Davis Select Financial (DFNL) and Davis Select Worldwide (DWLD). Normally such an event is not particularly noteworthy from our viewpoint. The launches of these funds are, however. They are actively managed equity ETFs based on strategies used for Davis Advisors' mutual funds, separately managed accounts and institutional funds. More importantly, they will follow the disclosure rules long used by index ETFs.

A bit of context is needed to understand why the launch of these funds is raising eyebrows. Actively managed ETFs remain relatively few in number. Most mutual fund companies have refrained from offering actively managed exchange-traded funds—particularly ETF versions of their equity-focused strategies. One particular hurdle has oft been attributed as the reason: transparency. Index (passive) ETFs disclose their holdings daily. Most mutual funds do not.

Attempts to provide a hybrid approach, meaning ETFs with reduced transparency, have generally not been successful. One platform that did pass the Securities and Exchange Commission's muster is Eaton Vance's NextShares. NextShares' exchange-traded managed funds provide limited transparency. Vanguard has its own platform and has filed to created ETF share classes for some of its actively managed funds. Last year, the SEC approved petitions from Bats Global Markets and the New York Stock Exchange for a streamlined process for listing actively managed ETFs. This was viewed as a positive for the industry, but it's not clear that the approval resolved the transparency hurdle.

Mutual fund provider Davis Advisors has settled on a simple solution for dealing with the issue of transparency. In registration statements filed earlier this month, the company wrote: "On each day that the Trust is open for business… the names and amounts of Deposit Securities to be included in the current Fund Deposit for each Fund will be published." Restating this in layman's terms, the ETFs' holdings will be disclosed daily. No lag. No complicated structure. Davis' actively managed ETFs will follow the same rules for disclosing their portfolios as index ETFs have done since the first exchange-traded fund (SPDR S&P 500 (SPY)) was launched in 1993.

Full, daily disclosure among actively managed ETFs is not a new concept. PIMCO provides it, as does Doubleline. The difference is that these companies offer bond ETFs. Since an issuer can have many bond issues outstanding and because the trading volume in each specific bond varies, there is less concern about active traders trying to jump ahead of a bond fund manager making portfolio changes then there is for a stock fund manager making portfolio changes. There are some actively managed equity ETFs offering daily disclosure [e.g., AdvisorShares Wilshire Buyback ETF (NYSE Arca: TTFS)], but they are relatively few in number and small in size. The four largest actively managed bond ETFs alone accounted for more than $2 out of every $5 invested in the 176 actively managed ETFs in existence as of December 31, 2016, based on data from Morningstar.

Davis Advisors is better positioned than other actively managed mutual fund providers to provide daily transparency because its mutual funds have below-average turnover ratios for their respective categories. The firm intends to follow a similar approach with its ETFs. Barron's quoted chairman Chris Davis as saying "it would be very strange if [the ETFs] ended up with a different kind of portfolio" than Davis Advisors' mutual funds. As such, it will be interesting to see if Davis Advisors turns out to be a trailblazer or more of an exception. The headlines and trends I've seen so far suggest that Davis will be an exception—unless these new ETFs turn out to be quite successful.

We've excluded the Davis funds from our mutual fund guide (which will be updated next month) because of the loads and expenses associated with the share classes most available to individual investors. Morningstar shows the Davis New York Venture (NYVTX), Davis International (DILAX) and Davis Financial (RPFGX) mutual funds as outperforming their category benchmarks. This potentially bodes well for the ETFs, but—as is the case with any brand new financial product—it would be prudent to monitor how they perform before making a decision on whether or not to invest in them.

DAVID O'LEARY

Why we'd celebrate a ban on embedded commissions for advisers

DAVID O'LEARY
Special to The Globe and Mail
Published Wednesday, Jul. 20, 2016 5:00AM EDT

David O'Leary, CFA, MBA is managing partner at Eden Valley Partners, a wealth management practice in Toronto

The Canadian Securities Administrators recently took another step closer to banning embedded sales commissions to financial advisers. My colleagues and I celebrated this news, since we believe a ban on commissions would be a huge win for both investors and our industry. Surprisingly, many industry stakeholders still argue against a ban. Here's why they're wrong.

Embedded sales commissions (also known as trailer fees) have two contentious problems: They create a conflict between the interests of adviser and clients, and they obfuscate the fees investors pay.

Embedded commissions present a conflict of interest because the adviser is being paid by the very provider of the investments they are recommending to clients. It would be like your doctor getting paid by pharmaceutical companies for prescribing their drugs to you. Even worse is the fact that different investments pay different commission amounts to advisers. So as an investor, you don't know whether your investments are the very best ones out there, or just the ones that rewarded your adviser most handsomely.

The second problem with commissions is that they are embedded within a larger fee (known as the MER, or management expense ratio) that bundles together all sorts of fees to various parties. This makes the amount a client pays the adviser far less transparent. In my experience, most clients don't realize their adviser receives any part of the MER – if they're even aware they are paying an MER.

Those who object to a ban on commissions are almost exclusively people who stand to profit from them. And they offer a variety of disingenuous arguments to defend them.

One common argument is that banning commissions would hurt investors since it would reduce the amount of choice they have in how they pay for financial advice. Portfolio manager John De Goey has been quoted with an excellent response to this: "Today, most restaurants offer a choice between tap water and carbonated water. Would adding a third option – toilet water – make for better outcomes?"
Another common argument claims that Britain banned commissions to disastrous effect. Claims are made that banning commissions created an advice gap, where smaller investors can't find advisers willing to serve them. This is blatant disinformation. No one knows precisely what impact the banning of commissions has had there. There are two reasons for this. First, we don't have enough data yet. The British ban came into effect just more than three years ago. And second, banning commissions was just one part of a sweeping set of changes known as the Retail Distribution Review.

Britain's Financial Conduct Authority has attempted to measure the impact of these changes and published a number of reports. Everyone admits their conclusions are tenuous, though, given how little data we have . Moreover, these changes were made against the backdrop of an evolving technological and sociological landscape, so that it may never be possible to isolate the effect of banning commissions from all the confounding variables.

More important, we have good reasons not to fear a dramatic advice gap in Canada. We have a healthy and robust banking system that gives the vast majority of us access to advice at a reasonable cost. And we have been a beneficiary of the trend toward robo-advisers.

Instead of fighting a commissions ban, let's promote financial literacy. That starts with clear information about what investors are paying for advice, and a system of adviser compensation that allows investors to trust they are receiving objective advice.

If we're successful, the industry won't have to hide the true cost of financial advice, because Canadians will see its full value and willingly pay a reasonable fee for it.

Understanding financial statements: TERs

BY **Dean DiSpalatro** February 27, 2015

With all the talk in the media about mutual fund fees, you may have seen references to TERs. What are those?

Trading Expense Ratio (TER) is a metric that figures into the price of mutual fund investing. The TER's calculated by taking the sum of all the fund's transaction costs and dividing it by the average value of fund assets for the annual reporting period.

So, if a fund has a TER of 0.27%, it means 0.27% of the fund's average yearly assets went to trading expenses.

Those expenses include brokerage commissions the fund manager incurs when buying and selling securities, notes Terry Rountes, CFO of Funds at Mackenzie Investments in Toronto.

They also include custodian transaction fees, which are charged each time a portfolio manager buys or sell a security. It's similar to paying bank fees for certain transactions, such as ABM withdrawals.

Investing in global markets is much more expensive, notes Dennis Tew, head of sales compliance and business operations at Franklin Templeton Investments in Toronto, and that will be reflected in higher TERs.

Emerging and frontier market funds tend to have the highest expenses. These markets aren't as efficient and lack the liquidity of developed market exchanges, so it costs more for managers to get trades done.

Tew adds some companies have better access to volume pricing on trades, which trims trading costs — like buying food in bulk.

Comparing TERs of bond and equity funds doesn't work because of the different ways these securities are traded. Commissions are embedded in a bond's spread, so unlike equity trading commissions, they don't factor into the TER calculation.

Funds that hold both stocks and bonds should have similar allocations for it to make sense to compare TERs. For instance, a growth fund with 80% equity and 20% fixed income will have a considerably higher TER than a balanced fund with a 50% equity, 50% fixed income mix, simply by virtue of the asset allocation. (If there's cash in the fund, it's likely going to be used for buying. And, as far as fees are concerned, cash falls in the fixed-income bucket.)

"But let's say you compared two balanced funds that are more closely aligned in terms of asset mix," says Rountes. "Any differences would be dictated by the manager's investment style."

A manager with a buy-and-hold strategy "doesn't go in and out of the market a great deal. So, the expectation is he or she can incur fewer transaction costs and fewer commissions, and therefore the TER will be lower," adds Rountes

The TER, along with Portfolio Turnover Rate (PTR), can help you judge whether a manager's marketing fits the facts.

Say you want buy-and-hold managers who hand-pick stocks through bottom-up analysis. Consistently high PTRs and TERs could be a red flag, notes Tew.

"If [he's] getting into more rapid turnover every year or two years, and [is] being held out as a buy-and-hold, bottom-up stock picker, the question would be, 'Why are you finding better opportunities so quickly after making these picks?' "

He notes it's possible the manager's making consistently exceptional choices that quickly hit her growth targets, triggering sales. When that's the case, gains will be reflected in her fund's performance. But if a high-turnover fund isn't doing so well, there may be a disconnect between the manager's buy-and-hold billing and how she actually runs the fund.

The shift to F Class does not mean lower fees

July 11, 2014 - 0 comments

Financial advisors throughout Canada are terrified. The Client Relationship Model (CRM2) is coming quickly, and it means that advisors will be obliged to disclose their fees and charges to clients. The non-disclosure of fees has been a quiet issue for years in the Canadian financial services industry. Most investors don't even realize that when they buy a mutual fund, the cost of ongoing financial advice is built into the management expense ratio (MER). It's bad enough that Canada has the highest average MER in the world at well over 2%, many Canadians are also paying for advice that they aren't receiving.

Disclosure is terrifying to advisors because when clients start to see the dollar amount that they are paying for advice each year, they will want justification. With the popularity of low cost ETFs, and the development of algorithm-based advice in the US, there is downward fee pressure coming from all angles.

Financial advisors are not fools. There has been a big industry push over the last few years for commission based advisors to prepare for the impending disclosure requirements. Part of this preparation has been a shift toward F class mutual funds. F class funds separate the advisory fee from the management expense ratio; when an advisor uses an F class fund, the client pays them directly. This eliminates the conflicts of interest present when advisors are paid commission by a product, and it also forces the advisor and client to agree on a fee that is fair relative to the level of service being provided.

I can't predict how commission based advisors will transition into the fee based world, but I would imagine that the standard 1% advisory fee will continue to be prevalent. With this in mind, I decided to look at Morningstar's database of F class mutual funds domiciled in Canada. I found that the average MER across all F class funds (excluding money market funds) is 1.29%. This means that even if an advisor decides to discount the advisory fee to .75%, the client is still paying, on average, over 2% in fees. There are some mutual fund families that do offer low costs; DFA funds come in with the lowest MERs, followed closely by TD's series of F class index funds.

Around 75% of financial advisors in Canada are only licensed to sell mutual funds, making it that much more difficult for investors to find unbiased advice at a reasonable price. IIROC's CRM2 disclosure requirements are moving advisors away from commissions to a fee based model, eliminating an inherent conflict of interest. It is a step in the right direction for financial advice, but unless investors demand a low-cost market-based approach from their advisors, it won't stop Canadians from pouring money into expensive mutual funds.

Robo-advisor CEO: Here's why I told clients they couldn't trade in sell-off

Alex Rosenberg | @AcesRose

Wednesday, 29 Jun 2016 | 5:59 PM ETCNBC.com

Betterment CEO on trading halt Wednesday, 29 Jun 2016 | 5:42 PM ET | 07:08

Automated investment advisor Betterment suspended client trading amid Friday's market turmoil, in what the company's founder and CEO now describes as a good decision that should have been better communicated to clients.

"The only thing I would do differently is I would put a notification in the app and say, 'By the way, we delayed trading right now,'" Betterment's Jon Stein said Wednesday on CNBC's "Fast Money."

Betterment is one of the most prominent robo-advisors, which are known for their low costs and high degree of automation; The company reports managing $4.8 billion for 170,000 customers.

On Friday, as stocks tanked in reaction to the U.K. vote to leave the European Union, Betterment suspended all trading from the market open until about noon EDT, apparently without informing clients. While this is within the scope of its client agreements, other well-known robo-advisors declined to halt trading, and Betterment's move has raised eyebrows on Wall Street.

Stein, however, said that Betterment's sole goal was to act in the best interest of clients.

"In a time of extreme uncertainty, we wanted to be very careful about how we handled customer orders," Stein said. "Even if you have the best technology, you don't want to go out sailing into a hurricane."

Stein made the case that Friday morning was not the best time to execute trades, and that since "Betterment's customers are long-term investors," making money off of the market's next move did not loom large on clients' minds.

Interestingly, Friday's market mayhem did not seem to steer individuals away from the robo-advisor's services.

Not only did customers not leave Betterment, but "more people signed up on Friday than on a typical Friday," Stein said Wednesday.

MFDA-licensed advisors have firm grip on Canada's mass market

New client research project from the SRO aims to explore what client segment would be most affected by the potential elimination of embedded commissions

By Beatrice Paez | April 25, 2017 17:00

Companies cited in this article

Financial advisors licensed with the Mutual Fund Dealers Association of Canada (MFDA) represent close to nine million households in Canada, or about 56% of all households, according to the results of a new research project from the self-regulatory organization (SRO).

Specifically, of the households that deal with MFDA representatives:

1. about 80% fall within the mass-market space, defined as those with less than $100,000 in assets,
2. while 15% are in the mid-market range ($100,000-$500,000), and
3. 8% are affluent investors (more than $500,000).

These were some of the key findings from the MFDA's client research project, which was announced early in 2016 and designed to produce a wide-ranging profile of mutual fund dealers' client base. The report's "timely" arrival comes at a moment when the mutual fund industry is bracing for a potential ban on embedded fees — the impact of which has yet to come fully into view, says Mark Gordon, president and CEO of the MFDA, who presented the preliminary findings of client research project at the Federation of Mutual Dealers in Canada's annual conference in Toronto.

The MFDA is aiming to explore the data collected in this project, which are based on the responses of all of its registrants, probing for trends that might offer guidance on which client segment, for example, stands to be most affected by the potential elimination of embedded commissions.

Read: The end of embedded commissions? How we got here

"We cannot predict the ultimate impact of the ban because there are too many variables. However, with these data, we can now, with some degree of confidence, identify those stakeholder groups that have the greatest chance of being impacted," Gordon says. "We can also, to some extent, identify the potential scope of that impact on stakeholders."

As part of the project, the MFDA mandated that registrants fill out clients' information, including age, address, account type, product code, the market value of their investments, for example.

The MFDA can also use these data, Gordon says, to map areas in which there may be a concentration of higher-risk products and to produce an aggregate picture of different demographics.

The SRO plans to publish its report on this project sometime in the spring.

A portfolio manager's view on the ban on embedded fees

by Joe Rosengarten22 Mar 2017

After the President and CEO of Advocis, Greg Pollock, gave his views on the CSA's plans to ban embedded commissions within mutual fund products last week, WP received a barrage of emails and calls from advisors and portfolio managers eager to speak out on this contentious, polarizing issue. In this special guest article, Portfolio Manager with Industrial Alliance Securities Inc., John De Goey, outlines his response to Advocis' view point.

"In essence, Advocis believes that the proposed discontinuation of trailing commissions would be detrimental to both advisors and their clients. The organization also claims to be in favour of choice and transparency. I'd like to respond to these positions with my own comments – and by asking Advocis to answer a few questions…

Making compensation transparent does not do anything to change pricing. Four quarters does not cost more than a dollar; not liking having to pay separately does nothing to change the quantum of payment. Why does Advociscontinue to suggest that transparent advice is somehow less accessible to investors of all account sizes?

The experience of the Retail Distribution Review (RDR) in the UK shows that once embedded compensation was no longer an option, advisors moved quickly to recommending lower cost products to clients. This is a real world experience that showed all investors paid less after the switch. This was clearly a win for consumers. Why doesn't Advocis mention it?

Investors pay for the sum of both products and advice. Why does Advocis only talk about the cost of advice and not the total?

Advocis says the number of advisors would drop if embedded compensation was no longer an option. I favour high standards/good advice and am opposed to low standards/questionable advice. The consensus is that it was overwhelmingly the less able advisors that left the business in the U.K. because they couldn't meet new (higher) proficiency requirements. Does Advocis want such advisors to continue in business? Is Advocis suggesting that every single advisor has unambiguous utility?

The Brondesbury and Cumming Reports showed that embedded compensation causes advisor bias. This bias, in turn, is extremely harmful to investor outcomes. Meanwhile, Advocis says almost nothing about evidence regarding advisor bias. Is Advocis unconcerned about the harm it may cause? If not, then what, exactly, is the Advocis position about the demonstrable harm caused by the bias that is part and parcel with embedded compensation?

Richard Thaler has done important work to show that people can be made better off by reducing their choices. By being "pro choice" Advocis implies that it merely favours maximizing retail client options. However, if the additional 'choice' on offer is shown to be sub-optimal, wouldn't they agree that removing the worst option can actually improve the universe of possible outcomes?

Many people have long thought financial advice was free. Similarly, many people fear that CRM II statements (which often go unread) still allow some clients to delude themselves into thinking advice is free. As strong proponents of transparency, wouldn't Advocis agree that a separate, itemized bill is more transparent and therefore more desirable than a yearend statement that can easily be misplaced, misinterpreted or missed altogether?

Finally, it should be acknowledged that Advocis does not speak for all advisors. For instance, I have long advocated for transparent, professional financial advice. Will Advocisbe clear in future articles and comments that there are a number of advisors out there who are opposed to their stated views?

I would prefer that Advocis's responses be rooted in demonstrable causal facts. For instance, Advocis has often suggested that the drop in the advisor population in the UK was due to the elimination of embedded compensation, while it is widely believed that the primary culprit is higher proficiency standards. Correlation is not causation… and a little truth and clarity in lobbying would be nice."

Advisor: Why I support the ban on embedded fees

by Joe Rosengarten19 May 2017

When the CSA launched a consultation paper outlining a possible ban on embedded commissions and trailer fees back in January, a fiery industry debate commenced and it shows no signs of fizzling out. In anticipation of receiving a deluge of responses, the CSA set a longer than usual consultation period of 150 days; a period that comes to an end in early June.

The proposed ban has been met with strong opposition from various industry insiders and bodies, many of whom are currently preparing submissions to send to the CSA. The Investment Funds Institute of Canada, for example, called on the CSA to "reconsider whether there is evidence of a market failure sufficient to justify prohibiting embedded commissions."

"If regulators have concerns about specific sales misconduct, existing rules give them the enforcement tools they need to address the concerns they have identified," Paul C. Bourque Q.C., IFIC president and CEO, said. "As a result, we are asking the CSA to reconsider whether a prohibition on embedded commissions is the only option."

Many in the industry sit on the other side of the debate, including Jennifer Black, a Private Wealth Manager and Portfolio Manager at DFS Private Wealth. Black currently runs a fee-based practice and likes the idea of banning embedded fees.

"I like the first step regulators took with starting to disclose fees a little more clearly to clients, but there is still an element that is not fully disclosed," says Black. "Hopefully the next step is banning embedded fees."

Black believes that, under the current rules, many investors are unaware of the true costs they incur and how they are calculated. "If there are embedded fees which are not paid as commission to the dealership, the actual embedded cost is not being disclosed," Black says. "That makes it difficult for investors to know what their true costs are."

Black sees a discrepancy in the industry between advisors who build holistic strategies and plans for the long-term and those who simply focus on selling products and accumulating assets. "Those advisors who are just sales people and don't add value from a servicing perspective might retain those assets for three or four years, but, going forward, they are going to find it very difficult to hold onto clients in this industry," she says. "In a world with no embedded fees their compensation will go down if they're not adding the value that will warrant their clients to go fee-based. You need to provide service for that."

Gordon Pape: I've crunched the numbers. It's true. ETFs are usually better

If you can't beat them, join them.

That's the approach being taken by a growing number of traditional mutual fund companies as they expand into the ETF (exchange-traded funds) business.

Mackenzie Financial, AGF, Dynamic, RBC, and TD have all launched new ETFs in the past couple of years. In April, Manulife and Desjardins entered the field. Fidelity has started an ETF line in the U.S. and it's probably only a matter of time until Fidelity Canada does the same. During March and April, 24 new ETFs were launched in this country.

Mutual funds still dominate in terms of assets under management (AUM) by a wide margin. As of the end of April, the ETF industry reported AUM of $126.3-billion. That was up $3.3-billion from the previous month. The traditional mutual funds business is more than 10 times as big, with assets of $1.3-trillion as of the end of March. You might think the mutual fund companies would just dismiss ETFs as a bothersome fly.

But ETFs are growing at a faster rate and no wealth management company can ignore that for long. At the end of 2006, Canadians had only invested $15.2-billion in ETFs. A decade later, that figure was $113.6-billion. That's an annualized growth rate of more than 22 per cent.

Investors are opting for ETFs for three reasons. First, they are relatively easy to understand. Second, they are cheap – some funds charge management fees of less than one-tenth of a per cent. Third, they are liquid. You can buy or sell at any time either on-line or by calling your broker.

But how do they fare in investment terms? We keep reading stories about how index funds continually outperform actively managed funds. Is that really the case? I did an analysis of three of the most popular ETFs and this is what I found.

Canadian equity funds: The most widely held ETF that tracks the full TSX Composite is the iShares S&P/TSX Capped Composite Index ETF (XIC) with assets of more than $3 billion. It has been around since 2001, so we have a decent track record with which to work. As of April 30, this ETF was showing a 10-year average annual compound rate of return of 4.34 per cent. That is much better than the 3.18-per-cent average for the Canadian Equity category, as reported by GlobeFund, which comprises both mutual funds and ETFs.
There are a few actively managed mutual funds available to the general public that have beaten XIC over that period. They include Mawer Canadian Equity (up 7.97 per cent over the decade), Beutel Goodman Canadian Equity Fund (6.15 per cent), BonaVista Canadian Equity (5.88 per cent), and Fidelity Disciplined Equity (4.71 per cent). However, most actively managed funds fell well short of matching XIC's returns.

(Note that I did not included F-series funds or those with unusually high minimum investment requirements in this analysis.)

U.S. equity funds: The iShares Core S&P 500 Index C$-Hedged ETF (XSP) is the leader here in terms of assets at $4.1-billion. However, the falling loonie has compromised its returns, which averaged only 9.81 per cent over the past three years. There is a smaller unhedged version of this fund that trades under the symbol XUS. It shows a three-year average annual gain of 18.37 per cent.

That's almost the same as the BMO S&P 500 Index ETF (ZSP), which is the largest unhedged U.S. equity ETF. It has a three-year average annual compound rate of return of 18.35 per cent.

To compare these to actively managed funds on an apples-to-apples basis, we need to take currency variations into account. The return on the both the unhedged ETFs is impressive and there are only a few U.S. dollar-denominated mutual funds with the same general mandate that beat them. They include the TD U.S. Blue Chip Equity Fund (up 19.33 per cent over three years), the Beutel Goodman American Equity Fund (up 18.9 per cent), the CIBC American Equity Fund (up 18.72 per cent), and the Mackenzie U.S. Dividend Fund (18.55 per cent).

Global equity funds: The BMO MSCI EAFE Index ETF (ZEA) is the leader here in assets under management. It tracks the performance of large and mid-cap stocks in countries around the globe except the U.S. and Canada. It recently passed its third anniversary and showed an average annual compound rate of return of 8.39 per cent over the three years to April 30. That is comfortably ahead of the group average for the International Equity category of 7.09 per cent but there were several actively managed mutual funds that bettered it by a wide margin.

One of the most impressive was the Trimark International Companies Fund, which posted a three-year average annual compound rate of return of 14.51 per cent. This was despite having a much higher management expense ratio of 2.98 per cent compared to only 0.22 per cent for ZEA. Sometimes you *do* get what you pay for.

The bottom line: Based on this small sample, ETFs are doing the job for investors. Unless you are very skilled (and lucky) at picking actively managed mutual funds, you will probably do as well or better by investing in a comparable ETF. If you want to know why this segment of the wealth management industry is growing so fast, there's your answer.

A couple of snippets from Google searches regarding "Mutual Funds Canada Commissions"

How are MERs Calculated and Stated?

The MER is expressed as a percentage of the fund's total assets. For example, if you invested $5,000 in a series A Canadian balanced fund with a 2.28% MER[1], you would pay $114 in fees for management, administration and taxes for a given year.

This chart illustrates how the cost of a mutual fund is calculated, and how it is put to work.

The fund returns you see listed in the newspaper or on your statements are what you get after the fund has paid the MER.

* The 2% management fee represents 81% of the total 2.28% MER. 50% of Mackenzie management fees are paid out to dealers in some form of compensation: trailers, commissions, co-op marketing.
[1] Represents the MER of a typical Canadian balanced fund.
[2] The applicable tax rates are calculated by taking a weighted average of the tax rates applicable to the province of residence of the investors of the Fund. An assumed tax rate of 10.6%, reflecting the current blend of Mackenzie Investments investors in HST and non-HST provinces, was used for the purposes of calculating the MER. The actual tax rate may differ.

Mutual funds

The breadth and depth of the Investors Group mutual fund line ensures that clients have the right mix of fixed income, balanced, and Canadian, U.S. and international equity mutual funds to help them achieve their financial goals.

Commissions, fees and expenses may be associated with mutual fund investments. Read the prospectus before investing. Mutual funds are not guaranteed, values change frequently and past performance may not be repeated.

http://business.financialpost.com/personal-finance/retirement/why-we-need-regulations-to-protect-seniors-from-unscrupulous-financial-advisers

Why we need regulations to protect seniors from unscrupulous financial advisers

JASON HEATH | July 8, 2016 1:32 PM ET

The Ontario Securities Commission has announced the formation of the Seniors Expert Advisory Committee, with the deadline for applications set for July 29. The committee could be instrumental in preventing the overt financial abuse of Ontario's elderly. But, even more importantly, it can alert children and grandchildren to the more covert abuse that the financial industry is quietly getting away with every day.

"The Seniors Expert Advisory Committee will give the OSC access to a multidisciplinary team of experts on issues related to older investors, providing us with valuable input," says Maureen Jensen, chairwoman and CEO of the Ontario Securities Commission.

The key issue for the committee, as I see it, relates to the lack of a fiduciary standard for Canadian financial advisers. This is a real risk at a time when our aging population is wealthier than ever and becoming increasingly vulnerable due to the natural changes in cognitive function as we age.

Consider this: your aging parents and grandparents' financial advisers have no obligation to provide them with advice that is in their best interest. So, unlike their doctor, pharmacist or accountant, there is nothing to require their banker, mutual fund salesperson or insurance agent to put them first. To me, this is like having a fox guard a hen house.

Here are some things that children and grandchildren should look out for:

1. Bankers who direct savings to proprietary, in-house products, despite the potential of better, non-bank alternatives.

2. Investment advisers who use mutual funds with embedded fees of two to three per cent, which nearly guarantee retirement savings will generate little to no return.

3. Insurance agents offering insurance solutions for all financial needs, when non-insurance solutions may be better or when no insurance may be needed in the first place.

The OSC initiative comes in the wake of last year's establishment of The Expert Committee to Consider Financial Advisory and Financial Planning Policy Alternatives by the Ontario government. The province has also signed on to the proposed expansion of the Canada Pension Plan. It seems clear that retirement and seniors are important for the province, but unfortunately, there is push-back from the industry.

According to the Investment Funds Institute of Canada, "Financial advisers already are subject to specific rules and regulations that clearly address the main issues that arise in the relationship between a financial adviser and his or her client. The introduction of a statutory fiduciary duty would not help to clarify the scope of an adviser's duties from situation to situation."

Quite to the contrary, I think a fiduciary duty does clarify the adviser's duty in all situations — put your client first, no matter what. This is particularly important because most people have no idea what sort of financial practices to seek out or avoid in the first place.

It's one of the reasons that the U.S. Department of Labor introduced new rules in April forcing American financial advisers managing retirement and pension accounts to act in their clients' best interests — the so-called fiduciary standard that the Canadian industry is trying so hard to avoid. White House estimates peg the cost of adviser conflicts of interest at US$17 billion a year, primarily due to investors being placed in products with excessively high fees.

As near as I can tell, the only negative impact on seniors and retirement security from a fiduciary standard are on the retirement savings of the unscrupulous financial advisers (hopefully, a minority of advisers out there) who are raking in those bloated fees.

The OSC committee will include members from a variety of practice areas, ranging from lawyers and academics to doctors and the financial industry. It will be interesting to see which financial industry participants end up on the panel, given that everyone in the industry has varying degrees of conflicted interests. The pessimist in me can't help but think that some people in the financial industry benefit from passive, uninformed seniors and their busy, trusting children.

As an Ontarian with aging parents, I do hope the Seniors Expert Advisory Committee considers the benefit of a government-imposed fiduciary standard to ensure that all seniors — my parents included — are protected. It seems clear the financial advice industry won't self-regulate and do it themselves.

No advice but still a price: Fund fees for DIY investors draw fire

SUBSCRIBERS ONLY

CLARE O'HARA - WEALTH MANAGEMENT REPORTER
The Globe and Mail
Published Friday, May 19, 2017 6:08PM EDT
Last updated Sunday, May 21, 2017 9:37AM EDT

The majority of mutual funds sold through online brokerages are charging clients millions of dollars in fees for advice they are not receiving, an issue regulators are being pressured to reform.

About 83 per cent of mutual funds sold through discount brokerages in Canada include trailing commissions that are typically charged by financial advisers for the advice they provide. Of the total $30-billion in assets held in mutual fund products in discount brokerages, more than $25-billion remain in fund series that bundle an advice fee within the product, according to a paper released in January by the Canadian Securities Administrators.

These funds are commonly known as Series A mutual funds and account for 68 per cent of the total amount of funds sold in Canada, according to the Investment Funds Institute of Canada (IFIC). These funds can charge a management expense ratio between 1.5 per cent to 2.5 per cent. By comparison, Series D funds – those tailored for do-it-yourself investors that strip out advice fees – it can be less than 1 per cent.

Do-it-yourself investors usually do not work with advisers to purchase investment products. As a result, these investors conduct independent research, make their own investment decisions and receive lower cost pricing when building an investment portfolio.

"Since discount brokers cannot and do not provide investment advice, clients are being robbed of returns," says Ken Kivenko, an investor advocate. "The investor abuse is staggering. Collecting money for advice while not providing it doesn't seem to bother [the regulators]."

Mr. Kivenko says there have been repeated efforts by industry groups to get the regulators to sanction discount brokers, but so far they have been ignored.

Earlier this month, IFIC proposed regulators adopt a rule that would ensure mutual funds that carry an embedded adviser fee are only sold in channels where advice is offered.

"Most companies already provide other series of funds with no or nominal trailer fees that investors can purchase if they are do-it-yourself investors or want to pay for advice separately," IFIC says in a statement. "The industry's proposal would advance the goal of ensuring that low-trailer or no-trailer funds are available to these types of investors in a more uniform and transparent way."

The regulators include all provincial securities commissions and the Investment Industry Regulatory Organization of Canada (IIROC) – which oversee investment firms including those in the discount brokerage channel.

"We think with IFIC joining in, IIROC may finally be forced to act," Mr. Kivenko says. "Seniors' nest eggs have been overcharged by these outrageous fees – fees for no service and fees that have been charged for many years."

IIROC recently issued findings on a review it completed on compensation-related conflicts of interest, and while it did not specifically look at the discount brokerage channel independently, the regulator said it will take IFIC's comments into consideration.

There are more than a dozen discount brokerages in Canada, including those run by all the major banks.

When contacted by The Globe and Mail, the majority of these discount platforms confirmed Series A mutual funds were available for purchase by DIY investors. Both HSBC InvestDirect and Desjardins online brokerage platform Disnat do not offer Series A funds for purchase. (Laurentian Bank Discount Brokerage and Credential Direct did not return calls for comment.)

Among those offering the funds, several platforms said they were aware of the discrepancies in fees being paid and either have measures in place, or are working on establishing measures, to make clients aware of additional options for purchase.

RBC Direct Investing will only sell a Series A mutual fund if a DIY version is not available. If a clients search for a Series A fund, they will only see an option to sell. About 50 per cent of all its mutual-fund assets under administration is held under their Series D offerings.

While TD offers DIY investors funds with embedded fees, it also offers its online clients low-cost index funds – known as the e-series – with MERs that can be as low as 0.33 per cent.

Questrade Financial has set up a reimbursement program to pay back all trailer fees directly to clients when they purchase a commission-based product (although there is an administration fee deducted to do so).

Qtrade's platform does not have a reimbursement program, but has pro-actively contacted clients to educate them more on the fund series. In February, Qtrade e-mailed all investors stating: "One way to avoid trailer fees is to hold D series funds, which are a lower-cost option offered by some mutual-fund managers. Many Series D funds are already available on our website."

Virtual Brokers, a division of BBS Securities Inc., offers Series A funds, but they have minimal assets as the platform has seen a significant shift to exchange-traded funds, says Bardya Ziaian, CEO of BBS Securities Inc.

But many industry groups are asking regulators why the funds are allowed to be offered on these platforms in the first place.

FAIR Canada – an investor advocacy group – has long argued that discount brokerages should not be permitted to offer Series A mutual funds since they are not permitted to provide recommendations or advice, says Marian Passmore, director of policy and chief operating officer of FAIR Canada.

FAIR Canada has asked regulators to consider a requirement for discount brokers or fund companies to offer a class of funds that have no trailing commissions. In addition, the recommendation would also see all firms that offer a particular mutual fund be required to offer the "F" class version of the fund, which does not have a trailing commission.

Don't bet against time with actively managed mutual funds

ANDREW HALLAM
Special to The Globe and Mail
Published Monday, May 22, 2017 6:16PM EDT
Andrew Hallam is the index investor for Strategy Lab. Globe Unlimited subscribers can view his model portfolio here and read more in the seriesonline here.

Rocky Balboa probably said it best. In his 2015 movie, *Creed*, Sylvester Stallone's character identified every boxer's nemesis. Time.
"Time takes everybody out. Time's undefeated."

It's much the same with actively managed mutual funds. You might think you've found a winner. It might beat the index over a three, five or 10 year period. But the index is much like time. Eventually, it wins.

The SPIVA Canada Scorecard says the S&P/TSX composite index beat 91.11 per cent of actively managed Canadian equity funds over the 10 years ended Dec. 31, 2016. The S&P 500 beat 98.28 per cent of U.S. equity funds sold in Canada. The Global stock market index beat 96.4 per cent of actively managed global stock market funds.
Sometimes we're tempted to search for winning funds. But that's a quest in vain. Take the Thomson Reuters Lipper Fund Awards. Each year, they award top-performing funds. Time, however, has the final laugh.

For example, in 2013 the RBC O'Shaughnessy All-Canadian Equity Fund was Lipper's top Canadian equity fund. It had the industry's best three-year track record. After it won the award, plenty of new investors piled into its corner. But the following year, TD's Canadian stock market e-Series index beat it by almost seven percentage points. RBC O'Shaughnessy All-Canadian Equity Fund earned 3.56 per cent. TD's Canadian Index e-Series index earned 10.23 per cent.
In 2014, the Lipper Fund Awards gave top honours to the new three-year Canadian equity champ. It was the Phillips Hager & North Vintage D fund. New investors jumped on board, putting their money on a winner. But the following year, that fund lost 9.6 per cent. TD's Canadian e-Series Index dropped just 8.53 per cent.
In 2015, Mawer's Canadian Equity Fund Series-A took Lipper's top three-year honours. One year later, it gained 15.77 per cent. TD's Canadian e-Series Index gained 20.63 per cent.
The Canadian Lipper Fund Awards began in 2007. That year, they awarded Dynamic Mutual Funds the top equity fund performer. Dynamic won the award based on their overall performance. But time has hit them hard since then.

Dynamic's Canadian equity funds with 10-year track records averaged 1.23 per cent for the 10-year period ended April 30, 2017. Inflation in Canada averaged 1.61 per cent. That means your grocery bills rose higher than Dynamic's Canadian equity funds.

In the United States, there's at least one firm that boasts they can beat the index. It's called American Funds. The company's website shows that five of its actively managed funds trounced the S&P 500 between 1976 and 2016. It says, "So the next time you hear 'You can't beat the index,' consider American Funds' long-term track record."

Unfortunately, they're boasting from the canvas as they remember better days. After fees, Vanguard's Total Stock Market Index (VTSAX) knocked them out over the past one-, three-, five-, 10- and 15-year periods.
Investing with index funds is like betting on time itself. Time is undefeated.

INCLUDES COMMENT LETTERS

DSC ALTERNATIVE HAS LIMITED MERITS

Melissa Shin / May 12, 2017

“Worried about DSC fees? Find out how to make 5%+ at the grid and not have to lock the client in!”

Intrigued? So was a Toronto advisor, who received this message from his managing general agent.

The answer was a life insurance-style chargeback schedule for segregated funds. If the client exited the fund within a fixed period, the advisor would have to repay the commission earned at time of sale—instead of the client being dinged with deferred sales charges.

On the face of it, that’s an improvement. The advisor gets compensated for the upfront work required to place the funds and, in theory, the threat of a chargeback keeps the advisor providing service for at least the next few years.

Win-win, right? Not so fast.

Advisors we talked to lauded the structure for freeing the client from undue exit restrictions. But some pointed out the advisor penalty could create another conflict.

“While the arrangement gets the investor off the hook for DSC charges, the benefit may be superficial, since this arrangement creates a powerful incentive for the advisor to keep the investor in the fund, even if it has ceased being optimal or suitable,” says investor advocate Neil Gross, president of Component Strategies Consulting.

Great advisors don’t intend to let compensation influence what they sell. Studies have shown, however, that loss aversion can be up to twice as powerful as the desire to gain. Lest you think yourself immune, researchers have found loss aversion to affect undergraduate students, pro golfers, foreign policymakers and capuchin monkeys. At the very least, the chargeback structure would be ill-suited to advisors who can’t stand to lose money.

As CSA says in Consultation Paper 33-404 (which doesn’t apply to seg funds or insurance licensees): “When deciding how to respond to a conflict of interest involving clients, only avoidance or controls (but not disclosure alone in most cases) are responses that [...] can be fully effective.”

One company offering the product concedes it isn’t for everyone. A rep told me an advisor “would need to choose” which clients would be suited. “The main objective was to allow the client [to not have] redemption fees if he left. The advisor is taking the risk.”

“There is evidence that embedded commissions paid by investment fund managers to dealers/representatives on sales made under the DSC option can […] incent unsuitable recommendations.”

–CSA Consultation Paper 81-408

That's fair. But most common retail structures allow clients to redeem funds without undue charges. They just tend to pay out less up front—and there's the rub.

Every structure is vulnerable to conflicts—advisors paid by the hour can drag out a meeting; flat-fee advisors can rush through planning. But it's embedded commissions that have drawn the ire of regulators, and for good reason. A chargeback schedule is an improvement to DSC, but a marginal one, as advisors may be loath to recommend an exit, even if it's the right thing to do. And, since seg funds don't fall under CRM2, clients may never know about that perverse incentive.

Advisors must be paid fairly for their work. But minimizing one conflict while creating another isn't a solution.

CLIENT COSTS WILL FALL UNDER COMMISSIONS BAN: LETTER TO EDITOR

Staff / May 24, 2017

Our current regulatory environment continues to generate reader commentary. Here, we publish a letter to the editor arguing that the cost of advice will not rise if embedded fees are banned.

Where is the evidence that unbundling will put advice out of reach? Where is the evidence that the cost (of advice or otherwise) will rise? Why haven't all advisors been frustrated by what IFIC is only now (in 2017!) noting as a problem ([advice trailers] paid to DIY service providers)?

[I acknowledge that under an embedded commission ban,] the cost of advice is unlikely to change materially. Similarly, product costs (especially re: mutual funds) will likely drop, but only modestly.

The big change regarding client cost is the substitution effect. [As we saw in the U.K.,] advisors will likely move from recommending high-cost products (often used previously due to embedded compensation) to recommending low-cost products (once embedded compensation is no longer available). The absolute savings will be passed on to investors. In short, the U.K. experience is a smoking gun [showing] that advisors are motivated more by compensation than by product merit when making recommendations to clients. When the compensation filter is removed, they actually do the right thing.

Here's an example. Let's say clients are currently paying 2.35% via a mutual fund MER (including a 1% trailing commission that goes the advisor). In an unbundled world, the cost advice might actually go up (say to 1.1%, on average). However, instead of using F-class funds that cost 1.35%, the advisor might recommend an ETF that costs 0.25%. That's a 0.1% increase in the cost of advice – and a 1.1% decrease in the cost of investment products. The absolute total cost to clients (since clients pay for both the investment product "parts" and the financial advice "labour") is about 1% cheaper. A client with a modest $100,000 portfolio would actually pay $1,000 less every year as a result.

It is simply disingenuous to talk exclusively about the cost of advice – as if the cost of investment products was not even a consideration.

Sincerely,

John J. De Goey, CIM, CFP, Fellow of FPSC
Portfolio manager, Industrial Alliance Securities Inc., Toronto

Canadians prefer financial advisors to robo-advisors

Only 7% of Canadians said they're likely to trust a robo-advisor's recommendations, new global HSBC study finds

By Beatrice Paez | May 24, 2017 16:15

As financial services institutions worldwide throw their weight behind emerging technologies, Canadians appear to be more lukewarm about embracing them than residents of other nations, according to a new report from London, U.K.-based HSBC Holdings PLC.

The survey, which polled more than 12,000 individuals from 11 countries, suggests a divide in attitudes between Asia and the Western nations toward technology, including the adoption of robo-advisors.

Among Canadians, there's still a strong preference for taking guidance from a human financial advisor over advice generated through an algorithm powered by artificial intelligence.

In particular, of the 1,001 Canadians represented in the survey, a mere 7% said they're likely to trust recommendations delivered by a robo-advisor. That's in contrast to 44% in China and 38% in India.

Moreover, the survey suggests that only 18% of Canadians surveyed feel that robo-advisors are able to offer more accurate advice than their human counterparts.

Canadians' ambivalence about the benefits of technological innovation reflects a lack of trust in new technology, the report notes.

In fact, the poll suggests that Canadians are among the most content with their bank's existing technology services — and they may not be so enthusiastic over the use of fingerprint technology to identify themselves or chatbots.

Appetite for chabots, which can dish out information traditionally delivered by a customer service representative, for example, may not be as widespread in Canada. The report suggests that only 16% turn to chatbots for customer service help.

In general, many Canadians express doubts about technology's ability to improve the world, with only 56% saying innovation can yield positive change compared with 89% in China and 85% in India.

"While those in Canada may be more resistant to change than their eastern counterparts, the research also points to the huge potential of educating people on upcoming and existing technologies as Canadians are among the most likely to respond positively to education around biometrics — such as touch and voice ID," says Larry Tomei, executive vice president and head of retail banking and wealth management with Vancouver-based HSBC Bank Canada, in a statement.

Slow uptake of new technology among Canadians could affect support for innovation, hindering financial services' efforts in Canada to develop solutions for the domestic market.

To make clients more receptive to the adoption of new technologies, the report suggests the need for greater education, perhaps even a touch of human intervention, with traditional advisors using the new tools to complement the work they do.

News from globeandmail.com

Looking for fee relief? Do the math before dumping mutual funds for ETFs

Wednesday, April 28, 2010

DAN HALLETT

A recent Globe and Mail article suggested that investors can improve their returns by replacing mutual funds with exchange-traded funds. This argument hinges on minimizing fees with ETFs, thereby adding fee savings (over more expensive mutual funds) to bottom line returns.

But if you think that dumping your mutual funds for ETFs is the path to riches and higher returns, think again.

The average mutual fund investor pays about 2 per cent annually in management fees, operating expenses and taxes. The average investor in TSX-traded ETFs pays closer to 0.4 per cent a year. The average potential cost savings, then, are about 1.6 per cent per annum. But this is only available to do-it-yourself (DIY) investors. Otherwise, investors who need professional advice have to pay for it either through higher product fees or fees paid to an adviser in addition to ETF expenses.

The 2 per cent average mutual fund fee generally includes compensation for advisers, whereas ETF fees do not include the cost of obtaining advice. So-called fee-based or fee-only advisers charge a fee equal to 1 per cent to 1.4 per cent of your portfolio value. Add that to ETF fees and taxes and you've got total annual fees of 1.5 per cent to 1.9 per cent annually. Wave goodbye to that fee advantage.

For those who need advice, there is great value in the design of a custom asset mix. In addition, selecting a handful of ETFs from among the 1000-plus trading in North America is challenging for most. But if you expect to fully benefit from low ETF fees, you'll have to jump into the driver's seat of your portfolio and become a DIY investor.

A problem for some DIY investors is that there is a significant barrier to realizing the full cost benefits of ETFs. In the hands of DIY investors, the ETF fee advantage usually vanishes thanks to poor portfolio construction and frequent trading.

Of all of the "indexed" or ETF portfolios that I have reviewed over the past 16 years, only two were focused on obtaining the broadest diversification possible at the lowest possible cost. This boring strategy is key to successful indexing. But investors can't seem to stop buying all of the market's slices and dices that ETF sponsors have packaged for investors. This not only violates the basic tenets of successful index investing, but it also sets the stage for more return-detracting behaviour.

I estimate that investors in stock mutual funds tracked by the Investment Funds Institute of Canada tend to hold their funds for an average of 6 to 7 years. (Note that this average is dollar-weighted, not based on an average of each investor's holding period.) ETF investors, on the other hand, only hold for a fraction of the time of their mutual fund investor peers. And there is strong evidence suggesting that the more frequently individuals trade, the less money they make.

Brad Barber, Yi-Tsung Lee, Yu-Jane Liu and Terrance Odean studied all the trades made on the Taiwan Stock Exchange from 1995 through 1999 for a 2008 paper entitled "Just How Much Do Individual Investors Lose by Trading?" They found that individuals lost a total of almost 4 per cent annually to trading fees and poor timing (while institutions profited). Similar research on U.S. investors pegs the "trading losses" at about 2 per cent per year. This is consistent with past Barber and Odean stock trading studies.

In a 2000 paper, they found that the higher an investor's trading frequency, the lower the investor's net returns.

My own research over the past decade strongly suggests that more volatile investments lure more investors into making ill-timed trades. But there is hope. Investors can benefit by paying attention to total fees, regardless of the type of investment. Investors that can develop an awareness of the real impact of brokerage costs and ill-timed trades can change their performance-detracting behaviour. Less aware investors, however, may want to think twice about jumping head first into the ETF world.

Dan Hallett is director of asset management for Oakville, Ont.-based HighView Asset Management Inc.

Investors demanding lower-cost funds

by Leo Almazora25 May 2017

Results from a recent study by a global research firm indicate continued investor demand for low-cost mutual funds and ETFs, which are typically passive funds and institutional share classes.

In a survey of open-end mutual funds and exchange-traded funds, Morningstar found they had an asset-weighted average expense ratio of 0.57% in 2016, down from 0.61% in 2015 and 0.65% the year before that. This was due to increased investor demand for lower-cost funds, mainly passive funds and institutional share classes that charge less in fees.

The asset-weighted average expense ratio was used in the study rather than a simple average. According to the firm, an asset-weighted average could better reflect average costs borne by investors, since a simple average could be skewed by a few high-cost funds with low asset levels. “In 2016, the simple average expense ratio for all funds was 1.14%, but funds with an expense ratio above that level held less than 10% of fund assets at the end of 2016,” the study’s authors said. “So it is very misleading when a fund company touts ‘below-average fees.’”

The firm also found that on average, the largest 2,000 funds in 2013— which accounted for 85% of mutual-fund and ETF assets at the time — did not change their expense ratios over the three-year period. This means the decline in average fund fees that investors paid was due largely to switches to lower funds.

The figures indicate that passive funds hold wide appeal. In 2016, they cost investors an average of 0.17% — 58 basis points less than active funds. From the fund providers’ perspective, passive funds are also cheaper: their asset-weighted costs decline more rapidly than those for active funds. This two-pronged advantage has led to passive funds’ having larger inflows than their active counterparts for the past six calendar years.

Investors’ general appetite for lower fees has affected preferences within the active segment. Past interest in pricier funds has waned in recent years; expensive active funds saw US$91 billion in outflows in 2014, and US$369 billion in outflows in 2016. The rush out of expensive funds accounted for all the outflows from active funds over the past two years.

On the passive side, the preference for low fees is also evident. The funds with fees in the cheapest 20% tended to gather almost all passive-fund inflows. The trend was found to hold across US equities, international equities, and fixed income — the three largest asset class groups. Vanguard and BlackRock/iShares, both firms with a broad offering of low-fee passive funds, were the only two firms to really benefit from the rapid growth in passive funds.

Investors Group moving clients to experienced advisors
Regional managers are overseeing the reassignment of clients to veteran advisors following the dismissal of approximately 400 primarily younger advisors

By Geoff Kirbyson | May 26, 2017 07:30

Client accounts are moving around at Winnipeg-based Investors Group Inc. perhaps like never before after the dealer firm reduced its roster of financial advisors over the past few months.

The firm recently parted ways with approximately 400 primarily younger advisors as CEO Jeff Carney continues to put his stamp on the company, slightly more than a year into his tenure. At the end of the first quarter, the company had 4,754 advisors, down from 5,321 a year ago. Almost half of those who remain (2,262) are considered veterans with four or more years of experience.

In turn, regional managers at Investors Group are overseeing the reassignment of clients to veteran advisors who remain with the firm, says Ron Arnst, assistant vice president of brand management and media relations.

"Typically, the regional manager matches clients with appropriate [advisors] considering any clients requests, such as age range and gender," he says.

Investors Group clients are free to switch advisors within the company at any time, a process regional directors also facilitate.

However, clients who have opted to follow their departing advisor to another firm were subject to the typical redemption and withdrawal process, Arnst says, noting that the deferred sales charge (DSC) schedule also applies.

"DSC funds carried a slightly lower [management expense ratio], but also had an additional fee schedule that applied if or when the client redeemed the investment prior to the seven-year schedule period," he says.

Investors Group is far from alone in taking such steps, says Dan Richards, CEO of Clientinsights in Toronto. Specifically, larger financial services firms have been taking a harder look at their smaller producers during the past several, often making the payout gird more punitive.

"In some cases, I'm sure [larger firms] hoped the advisors would get the message and find somewhere else to work," Richards says. "If firms aren't seeing the prospects of running a significant book of business, increasingly they're saying [to those advisors], ‘It's not going to work out'."

Along with the increased focus on veteran advisors, Investors Group is also increasing its focus on high net-worth clients. However, the firm isn't looking to shed smaller accounts.

"Investors Group is committed to working in the best interests of all clients," Arnst says, "regardless of asset size."

IGM downsizing, focusing on HNW clients
The financial giant has let 400 advisors and 80 administrative staff go in recent months

By Geoff Kirbyson | May 05, 2017 17:30

Jeff Carney, CEO of Winnipeg-based IGM Financial Inc. believes sometimes you have to get smaller before you can get bigger.
The firm's biggest operating company, Investors Group Inc., has let go more than 400 advisors and administrative staff positions.
Thanks to higher standards for advisors, 400 primarily younger consultants were let go in recent months.
"I've raised the standard," Carney says. "We didn't think they were going to make it under the new skills we're looking for in the future."
At the end of the first quarter, the number of veteran consultants — defined as those with four or more years of experience — was 2,262, slightly less than half of the cohort of 4,754. There were 5,321 consultants a year ago.
Carney, who took over as CEO of IGM a year ago, says he doesn't rule out further job losses in the future, but says no immediate layoffs are imminent.
The firm also laid off 80 administrative staff. "We combined some different [regional] districts together and created an opportunity to reduce costs and put that money back to work in other things that we're trying to do," Carney says. "It's a reallocation of resources."
Thirty of those affected people were in Winnipeg with the remaining 50 spread out across the country.
"I'm still in my early days. I'm looking at everything. I don't want to sit here and say we'll never have [more layoffs]," he says. "Right now, I'm focused on growing our company and accelerating the growth. In some areas we might be hiring, and in some areas we might be reducing, depending on what we're doing with our business model as we evolve.
"Where we can find efficiencies," he adds, "we [have to act] because it's a competitive landscape and we've got to reinvest in pricing, products and people who can bring new skills to us."
Carney addressed the media following IGM's annual general meeting in Winnipeg Friday morning. A couple of hours earlier, the company announced net earnings available to common shareholders for the three months ended March 31 of $177.1 million (74¢ per share) up from $167.0 million (69¢) in the corresponding period a year earlier.
Part of the increased focus on veteran consultants is a heightened focus on high net-worth clients.
"We're moving more up-market," Carney says. "We were probably working too hard for the smaller clients and now we're working for the right ones. We don't want to walk away from our smaller clients but they don't need that level of sophistication at that stage of their lives vs somebody who has accumulated significant wealth and needs to know that their retirement is going to fund the rest of their lives."

http://www.advisor.ca/news/industry-news/td-lowers-trailers-but-doesnt-seem-to-pass-savings-to-clients-conseiller-exclusive-234482

TD LOWERS TRAILERS, BUT DOESN'T SEEM TO PASS SAVINGS TO CLIENTS: CONSEILLER EXCLUSIVE

Conseiller Staff / May 25, 2017

A Conseiller.ca exclusive report finds that TD has lowered trailers on certain funds, but did not subsequently lower the fees charged to clients.

Several advisors provided Conseiller.ca with documents showing that on April 1, TD Asset Management cut trailing commissions on the following funds:

- TD Ultra Short Term Bond Fund;
- TD Balanced Income Fund;
- TD Balanced Growth Fund;
- TD Diversified Monthly Income Fund.

With the TD Balanced Income Fund, for instance, the trailers fell 25 basis points, but the management fee, so far, remains the same.

When asked for comment regarding the trailer reduction, TD declined.

Advisors told Conseiller.ca they felt the move was, while compliant, unethical. One spoke of boycotting TD funds.

http://www.wealthprofessional.ca/market-talk/csa-osc-grilled-on-embedded-commissions-226088.aspx

CSA, OSC grilled on embedded commissions

by Leo Almazora30 May 2017

In a recent submission to the CSA's consultation paper on discontinuing embedded commissions, a senior investor expressed frustration over regulators' failure to answer questions he asked about the model.

"I contacted the CSA with five questions related to the disposition of embedded commissions under certain changing 'advisor' to investor relations," said an 83-year-old investor Peter Whitehouse in a seven-page letter emailed to the association. "I received a response that I should click on a provided link to the OSC and rummage through 74 Rules, Instruments & Policies papers that should be related to my quest."

Prior to contacting the CSA, Whitehouse reached out to the OSC to ask the same questions. The OSC did not answer them, but did say that embedded commissions are sent from the mutual fund company to the investment dealer, who then distributes the commissions among its advisors based on a pre-arranged agreement.

The questions Whitehouse asked the regulators were:

- What happens to the continuation of the embedded commission payouts when an investor terminates their relationship with their financial advisor? Who gets the future embedded commission payouts?
- What happens to the continuation of the embedded commission payouts when a financial advisor employed by Investment Dealer "A" resigns from an investor's account?
- What happens to the continuation of the embedded commissions payouts when the investor's financial advisor employed by investment dealer "A" sells the investor's account (selling the book) to another financial advisor employed with the same investment dealer "A"?
- What happens to the continuation of the embedded commissions payouts when the investment dealer resigns from the investor's account?
- What happens to the continuation of the embedded commission payouts when an investor terminates their relationship with a financial advisor employed by investment dealer "A" and the investor transfers their account to investment dealer "B"?

In his letter, he asserted advisors – dealing representatives – should not be given sales commissions by the fund companies they recommend, calling it a "pure conflict of interest" that exposes investors, particularly seniors, to various abuses.

He also spoke out against advisors who sell investors mutual funds on a deferred sales charge (DSC) basis without disclosing that they'd immediately receive a 5.5%-6% sales commission. According to Whitehouse, there's no requirement for advisors to inform investors of the high sales commission rate prior to the transaction, or of the detrimental impact related to DSC-based fund purchases.

He further urged the CSA to disallow bank-owned dealers' practice of sending complainants to an "internal ombudsman." Since there is no regulatory disciplinary oversight of such bodies, he contended, it exposes wronged investors to low-ball restitution recommendations and rejection of valid claims based on false and misleading reasons.

"If a dealer rejects a claim, they should be directed to OBSI and never to the unregulated entity of the bank 'internal Ombudsman,' as so many bank brochures do," said Whitehouse http://www.inman.com/2017/06/01/real-estate-referral-fees-the-good-the-bad-and-the-ugly/

Real estate referral fees: The good, the bad and the ugly

The common business arrangement could be improved with transparency

BY TERESA BOARDMAN

TODAY 3:00 A.M.

Key Takeaways

- Helping a homeseller find the perfect agent adds value to the transaction.
- Consumers have a right to know if their agent is paying a referral fee and whether a referral constitutes a recommendation.

I just love it when a check comes in the mail a few weeks or months after I referred a friend, family member or client to a Realtor in another market. I try my very best to find the perfect match. Sometimes I even turn leads away (insert gasp here) with instructions on how to find an agent and what to look for.

There are times when I accept clients from other agents and pay them a referral fee. Usually it works well, and I don't mind paying the fee for a client who is ready to buy or sell now.

That's the good. However, referral fees are also territory for abuse, and the practice can leave consumers in the dark about who's paying who.

More leads than home sales

Agents and other industry players "capture" leads so that they can sell them. The internet has made it easier than ever to do so. (Indeed, there are far more leads than there are home sales.)

We get emails and phone calls about leads who are looking for an agent in our market. Apparently, these leads wait patiently for their captor to sell them to an agent. Maybe that's what happened to all the homesellers this year.

Referring agents can become the middlemen that come between middlemen without adding value. The captor adds no value to the transaction; the client remains in the dark, unaware of the exchange.

One improvement: Transparency

Consumers often confuse referrals with recommendations. They may not vet the agent but assume that the referral is a vote of confidence.

The weakest kind of referral, of course, is the lead capture. The person who captured the lead knows nothing about potential clients and whether they're qualified to buy or ready to sell. If the agent who accepts the lead is able to convert him or her into a client, and that clients buys or sells real estate and the transaction closes, the referrer expects a fee.

Some of the agents who refer business to me found me on the internet. They don't know me or anything about me. They don't know if I will do a good job. Most of the time they do not know the lead either. They acquired contact information, and they want to get paid for it.

Consumers who click on the wrong link or call the wrong agent may end up paying that agent indirectly as their contact information is given to another agent. I wonder about the people who get captured and sold because they cannot find a Realtor — not finding a real estate agent would take some effort.

The system could be improved by requiring the person making the referral to disclose the fee (and who knows who and how they know each other) to all parties.

In Minnesota, we must disclose who is paying us a commission and how much, but we do not have to disclose how much (or who) we are paying for the business.

The law says that I can only pay licensed brokers for a referral. The first thing I do when a referral comes in is check to see if the person making the referral is licensed and if they are active.

Calls about a 'business opportunity'

People I don't know will occasionally call with a "business opportunity." They want share the name of a person looking to buy or sell a house, and for me to pay for it.

Most agents have heard relocation horror stories from clients. Let's say Big Box Brokerage (BBB) has a relocation department. BBB refers persons who are relocating to BBB agents. Often, the agents with the least amount of experience will agree because they do not yet have enough business and they need the experience and the money.

BBB takes 40 percent of the new agent's commission and charges a 35 percent referral fee. The buyers or sellers end up with an inexperienced agent who is working for almost nothing. The consumer ends up with an inexperienced agent tasked with navigating a cross-country relocation.

What consumers have a right to know

We need to do more to educate consumers. They need to understand that if they get referred to an agent, they should interview that agent like they would any other and ask the same questions. They need to understand that in their real estate search, they may get captured and sold, or end up being referred by one agent to another for a fee without ever knowing.

I don't think leaving contact information on a real estate agent website is wise. I have a hard time understanding why people do it and why they enjoy drip email campaigns and having agents keep in touch with them.

I won't leave my contact information on any website, and I block advertising campaigns or opt out of them. I am just not lead material.

Helping a homeseller find the perfect agent adds value to the transaction. It is wonderful when a friend or a past client thanks us for introducing them to that amazing agent.

Referring business to others (even if we don't know them) just because we can add value to our bank accounts could be part of the reason why people don't trust real estate agents.

RBC INSURANCE REDUCES MERS ON SEG FUNDS

Staff / June 5, 2017

RBC Insurance has reduced management fees by 20 basis points on seven of its balanced segregated funds. The changes are effective June 5, 2017, and are available to all new and existing clients with no restrictions.

	RBC GIF Invest series		**RBC GIF series 1**		**RBC GIF series 2**	
	MER before fee reduction (%)	MER after fee reduction (%)	MER before fee reduction (%)	MER after fee reduction (%)	MER before fee reduction (%)	MER after fee reduction (%)
RBC Balanced GIF	2.48	**2.25**	2.79	**2.57**	2.97	**2.74**
RBC Conservative Growth & Income GIF	2.20	**1.99**	2.46	**2.24**	2.61	**2.38**
RBC Balanced Growth & Income GIF	2.41	**2.20**	2.60	**2.39**	2.80	**2.59**
RBC PH&N Monthly Income GIF	2.37	**2.15**	2.76	**2.54**	2.88	**2.66**
RBC Global Balanced GIF	2.48	**2.25**	2.72	**2.51**	2.84	**2.62**
RBC Select Conservative GIP	2.26	**2.04**	2.64	**2.42**	2.83	**2.61**
RBC Select Balanced GIP	2.41	**2.19**	2.70	**2.48**	2.89	**2.67**

Note: The 2016 MERs before fee reduction are the actual MERs for the year ended December 31, 2016. The 2016 MERs after fee reduction recalculate the 2016 MERs as if the new management fee percentages had been in effect throughout 2016. The MERs for 2017 are expected to be between the 2016 MERs before fee reduction and 2016 MERs after fee reduction, since the reduced management fee percentages will take effect partway into 2017.

Dear Sirs/Mesdames:

RE: CSA Consultation Paper 81-408 - Consultation on the Option of Discontinuing Embedded Commissions ("Paper")

InvestorCOM is pleased to provide our comments to the Canadian Security Administrators' (CSA) Consultation Paper 81-408 - Consultation on the Option of Discontinuing Embedded Commissions ("Paper") dated January 10, 2017.

InvestorCOM is an affiliate member of the Investment Funds Institute of Canada (IFIC) and The Federation of Mutual Fund Dealers (the "Federation"). Having participated in the Advisory Task Force for both organizations, we support IFIC's and the Federation's comment letters submitted to the CSA on June 9, 2017.

As a Regulatory Technology ("Regtech") solutions provider for the investment funds industry, our comments reflect both industry and investor research responses to the CSA investor protection and market efficiency issues outlined in the Paper. In addition to the comments summarized in IFIC's and the Federation's letters, we wish to emphasize the following points.

Embedded commissions provide investors with choice

Based on the CSA Investor Index (October 2012), 80% of Canadian households own less than $100,000 in investible assets and mutual funds, held by 4.3 million households, are the most common and important holding in their RRSP and RRIF accounts. There are many different dealer and advisor compensation models in the mutual fund industry, embedded compensation being one.

The CSA's concern is that payment by the investment fund manager to the investor's dealer, which is used in part to pay the advisor (embedded fee) is a conflict of interest. It is relatively simple for the industry to provide further disclosure and transparency around the embedded fee structure, which will largely eliminate the conflict of interest concern while still providing investors with a fully informed choice as to how they pay for investment products and services.

Low net-worth investors (<$100,000) who invest in mutual funds today have an advice component included in the product fee. If embedded fees are eliminated, many of these investors will not be able to afford to pay for advice through a "fee for service" model or will forego paying for advice and choose a direct investing or robo advice model which may not be suitable for their level of investment knowledge. The embedded commission model fills the "advice gap" for many investors with assets under $100,000 by investing in funds that meet their risk tolerance and long-term savings objectives.

Eliminating embedded commissions will not significantly improve investor fee awareness

CRM2 and POS3 regulations are already in place to make direct and indirect mutual fund fees more transparent. Since CRM2 was only fully implemented in 2017 and POS3 in 2016, more time is needed to measure the effectiveness of these regulations on investor awareness. The industry is committed to ensure that advisors are using these regulations for investor education and fee disclosure. With increased investor education and greater transparency on fees and costs, investors will be armed with better information, leading to net improvement in overall returns to investors.

Investors need help

Despite all the regulatory changes, industry changes, advisor and investor education, the fundamental problem remains that a large majority of investors need the help of an advisor to plan for their future and retirement. The skills required to understand increasingly complex financial products and compare investment alternatives is significant. Investors need the help of advisors to guide them through the wide range of investment choices including securities, mutual funds, exchange-traded funds (ETFs) and deposit products. Bundling financial advice with financial products in the current embedded commission model for mutual funds makes it easier and more accessible for low net worth investors to make choices between investment options.

Unintended Consequences

Independent research conducted by IFIC, the Federation and The School of Public Policy at University of Calgary all conclude that eliminating embedded commissions will hurt low net worth individuals most. This has also been shown to be the case in other jurisdictions as well, including the UK and Australia. Restricting access to advice for low and middle income families in Canada will adversely affect their wealth accumulation and ultimately their retirement savings and the Canadian economy.

Role of the Regulator

The role of the regulators is to ensure that the policies and guidelines protect investor interests and address market failure. The role of the regulator should not be to promote a market outcome. The shift towards a fee-based advice model is underway in Canada, however this should be allowed to occur in a marketplace that allows for all relevant investment options and fee options.

Advisors play a critical role

Advisors play a critical role in helping investors accumulate wealth and prepare for their retirement. Research continues to show that the average investor has limited knowledge of basic financial products and how their advisors are compensated. The recent implementations of CRM2 and POS3 are aimed at increasing investor knowledge and awareness which can be monitored and measured over time. The industry needs time to see the positive impact of these changes. Research indicates that Canadians who use financial advice accumulate significantly more wealth as compared to non-advised households.

Robo advice is one of many investment channels

There is room for both digital technologies and advice products in the marketplace. Digital technologies including robo advice and direct investing provide choice for those investors who have good investment knowledge and are comfortable managing their own investment choices. However, these channels do not serve the needs of low net worth investors who have limited knowledge of investment products and who are currently invested in mutual funds with embedded commissions.

There are alternatives to an outright ban

Instead of an outright prohibition, IFIC has proposed a number of reforms that, if implemented, would address most of the harms identified by the CSA, and would continue to allow investors the choice of paying for a mutual fund investment directly or indirectly, while also avoiding the unintended consequences of an outright ban. These include:

- Providing investors with a choice of both embedded and unbundled fee arrangements with enhanced transparency around fees paid
- Leveraging the current CRM2 and POS3 regulations that mandate fulsome disclosure regarding fees and services to be provided upon account opening, before each purchase and annually
- Standardizing embedded fees across the industry to remove the financial incentive for an advisor to recommend one fund over another based only on trailer fees since all funds would pay the same trailer
- Restricting the sale of Series A funds only in channels where advice is permitted
- Establishing guidelines under which sales of Deferred Sales Charges (DSC) funds are sold, so investors are not locked into funds that are not suitable for their age or time horizon
- Allowing modest investors access to embedded fee series funds so they can continue to receive financial advice

- Separately disclosing embedded fees to increase transparency and standardize naming conventions for fund series to facilitate comparisons of MERs and trailer fees across similar products

Conclusion

The dynamic consequences of an outright ban on embedded commissions will not elicit the results that the regulators or investor advocates are looking for, but rather will result in a negative impact on the retirement savings and wealth of the low to middle income investor; exactly the target group for which the ban was intended to help.

Our recommendation is to keep embedded commissions as a marketplace choice for investors and make fees more transparent. We agree that the industry needs competent financial advisors that can deliver affordable and transparent financial advice to all Canadian households. We also agree that the industry needs to increase investor proficiency standards, promote best practice and enhance suitability requirements.

As a Regtech provider to the industry, InvestorCOM is committed to working with the industry and regulators to develop products and services that help advisors disclose fees, help educate clients and help fund managers monitor compliance.

Thank you for giving the industry an opportunity to comment on the consultation paper.

Sincerely,

Anthony Boright, President

Re: CSA Consultation Paper 81-408 - *Consultation on the Option of Discontinuing Embedded Commissions*

We are writing to provide comments with respect to the CSA Consultation Paper 81-408: *Consultation on the Option of Discontinuing Embedded Commissions* ("Paper").

Quadrus Investment Services Ltd. ("Quadrus") is one of the largest mutual fund dealers in Canada with more than 3770 registered investment representatives. It is the exclusive mutual fund dealer for London Life Insurance Company and preferred mutual fund dealer for investment representatives of The Great-West Life Assurance Company.

Introduction:

Studies have shown that Canadians at all economic levels have significantly better long term economic outcomes when working with an advisor than when not[1]. However, as noted in the Paper, not all Canadians, particularly in the mass-market segment, use an advisor. In our view, the test of any regulatory initiative relating to advice is whether it is likely to *increase* (or at least not decrease) the number of Canadians obtaining good, qualified, understandable and affordable advice, and therefore obtaining improved financial outcomes. Our principal objective, when responding to this and other related CSA papers, is to arrive at a solution that maximizes the range of access to advice and payment options available to Canadians at all economic levels. We believe that in this regard our overall policy objective is shared with CSA members: providing a solid framework allowing Canadians to confidently invest and save for their own current and future needs. Certainly any initiative that is likely to eliminate or limit access to good, qualified, understandable and affordable advice is not likely to improve financial outcomes of Canadians and will not benefit the Canadian economy in general.

We strongly support CSA initiatives to improve the professionalism of advisors, clarify the costs of investments and of advice, clarify titles used in the industry and improve the financial literacy of Canadians. We are convinced that all of these initiatives will increase the quality of, and access to, investment advice thus leading to improved financial outcomes for Canadians.
